It is further stated that the machine, in its then imperfect state, was seen by the late sir Francis Kinloch, bart. of Glimerton, a gentleman well acquainted with mechanics, and who had paid much attention to country affairs; it occurred to him, that the machine might be rendered more perfect, by inclosing the drum in a fluted cover, and fixing on the outside of it four fluted pieces of wood, capable of being raised a little from the circumference by springs, in such a way as to press against the fluted cover, and to rub out the grain as the sheaves passed between them; but after repeated trials, it was likewise found to bruise the grain nearly as much as the model from which it was copied. In that state it remained for some time, and was afterwards sent by sir Francis to a very worthy and ingenious character, Mr. Mickle of Know-Mill, in his neighbourhood, (a millwright by profession,) who had for a considerable time employed his thoughts upon the same subject. After much consideration, and several trials, it appeared to Mr. Mickle, that the purpose of separating the grain from the straw might be accomplished upon a principle different from any that had hitherto been attempted, namely, by skutches acting upon the sheaves by their velocity, and beating out the grain, in place of pressing or rubbing it out. Accordingly a model was constructed at Know-Mill, in which the grain was beat out by the drum, to which it was presented through two plain feeding rollers, which were afterwards altered for fluted ones. The first machine, on a large scale, executed upon this principle, was, it is said, done by a son of Mr. Mickle's, for a Mr. Stein of Kilbagie, in the year 1786, which, when finished, performed the work to the satisfaction of all parties. A patent was afterwards applied for and obtained in 1788. Since that period, as well as the first introduction of these machines, many other improvements have been made on them by different ingenious artificers in many different places; a screen has been added for the grain to pass through into a winnowing machine, and a circular rake to remove the straw from it; as before this addition, the straw was forced out from the beater upon the upper barn-floor, and required much time and labour in shaking and putting it into order, which by this contrivance is saved. And besides having a sufficient degree of velocity, without its being so great as to injure the machinery, it is found that a point upon which the clean threshing of all sorts of grain materially depends in the use of this machine, is the management of the iron covering, under which the beating-wheel, having six or more beaters, moves: in some machines this is fixed, while the beating-wheel is capable of being raised or depressed at pleasure; but a more late improvement is to render the iron roof moveable and the wheel fixed, the iron being placed so close to the beaters, that the grain is rubbed as well as shaken out of the ear. And in some cases the beaters are somewhat rounded, but the flat form is probably better.

Different machines of this sort are also said to have been lately constructed so as to work with chains instead of cogs, and to perform the business in a satisfactory manner. Another great improvement is likewise believed to have been made on the feeding rollers; which is that of having the upper roller, instead of being one solid cylinder of wood, with rods of iron fixed upon it, as was formerly the case, an octagon or decagon of cast iron, and divided into four parts, which are loosely joined into each other, so that in turning round, each part can rise or fall in a separate manner, according as the corn is spread out in a thicker or thinner way. The advantage is, that by means of this contrivance the corn is regularly held; whereas, by the roller being all of one piece, if at one part the grain should happen to be more in a heap or lump than at another, the whole roller is raised, and a great part of the grain passes through, without having been held sufficiently to the beaters, and is consequently imperfectly threshed out.

This sort of machine is sometimes constructed with a vertical shaft, on which is fixed in a horizontal manner an iron bevil wheel, six feet in diameter, which drives another about eighteen inches diameter upon a tumbling shaft, upon which is also an iron spur-wheel, three feet six inches in diameter, driving one about ten inches upon a short iron shaft, which likewise carries a drum or pulley, three feet six inches in diameter, from which a six-inch strap drives one nine or ten inches in diameter, hung upon the iron shaft or spindle which runs quite through the wood-beater or barrel, two feet in diameter, and three feet in length, having fixed upon it, by means of strong screws into its iron bonds, twelve wrought-iron bars, about an inch square, which beater making upon its horizontal axis about three hundred revolutions in a minute, and consequently nearly three thousand six hundred strokes in that space of time; the corn being carried to it by means of a cloth, which is moved forwards by rollers, lying nearly upon a flat surface of six feet long, by three feet wide, two to three feet high from the ground-floor, which is a very convenient position to feed upon, and passing between a pair of fluted rollers, over a bar, comes in contact with the beater, through a cavity, which may be varied by screws, from an inch in width, to the thickness of a grain of corn, when the straw is immediately delivered, perfectly clean upon the floor on the outside of the machine, no more injured for thatch, or other purposes, than by the flail, and the corn in its passage under the beater is filtered through a wooden frame to the floor, where it remains for removal. Upon this kind of threshing-machine many different trials have been made in the view of ascertaining what sort of power, construction, and velocity or speed, would produce the best and most beneficial effects on the work, and many improvements have been suggested which we have not room for reciting.

Some machines of this sort have large wooden fly-wheels, of from twelve to fifteen feet diameter, fixed upon the tumbling-shafts, which run over or above the horse's heads, perhaps made of fir-timber, as cork unfortunately is seldom to be met with; but as their speed, in such a situation, can rarely afford any assistance, the lighter they are, the less impediment, it is supposed, they will produce. The bars or beaters are also sometimes as much as an inch and a half, or two inches thick, from the barrel or roller upon which they are fixed, and the roller itself three feet or more in diameter; but so much of the bar is certainly, it is thought, unnecessary, as exceeds the length of straw drawn in by the rollers, during each interval between the strokes, and which is seldom more than half an inch; consequently, whatever is more than three quarters, produces an increased impediment.

THRESHING-MACHINE.

ment. The greater the diameter of the fame beater, from meeting with the principal resistance, fo much farther from the centre, of course, the proportionately greater power is required to work it; but this last description of beater is said, in general, to be found to make the best work, and the reason is thought obvious: they are necessarily driven by water, steam, or a number of horses, and, it is concluded, calculated to make the same number of revolutions in a minute as one of two feet, in which case their velocity, on which all depends, is just half as much more—a most important point indeed. The means of regular steady driving is likewise of material importance in all machines of this nature, where animal labour is necessary.

A very powerful improved machine belonging to Mr. Harbottle, of the Rimingham farm, near Henley on Thames, consists of a horse-wheel which contains 136 teeth, or pinion wheel with 26, a large wheel with 88, another with 21, the same with 88, and a further one with 21, forming the drum. Underneath the drum is the contrivance for winnowing, or the wheel that separates the chaff from the corn, by blowing it back into a bin below the feeder, and allowing the corn to fall into a box, from whence it runs. Every revolution of the horse-wheel in this machine produces eighty-eight and a half of the drum; and as the horse-wheel goes about three rounds of twenty-four yards each *per* minute, or two miles and a half in an hour, the drum of consequence must revolve on its circumference, of three yards and a half, 265 times in a minute, or 927 yards. The feeding-board is five feet four inches wide. The drum-wheel is four feet four inches diameter, being covered with sheet-iron, and has four beaters, which project four inches; making the above number of revolutions to one of the horse-wheel, and the horses going the above distance in the hour; in a path twenty-seven feet diameter. The cogs of the wheels are of white thorn properly seasoned, working into others of cast-iron; payed only with black lead, not any greafe being employed. The level of the stage on which the men stand to feed, is eight feet above the barn-floor in which the machine is fixed.

The drums of threshing-machines, it is remarked, in general revolve from sixty to a hundred times for one revolution of the horse-wheels; and that in proportion as these move slower, the horses must go faster, so that the utmost nicety is necessary to properly adjust this: as if the horses are under the necessity of trotting, they are greatly injured in long continued exertion, and if they move too slowly, the work is imperfectly performed. A steady common walk is the pace at which horses should be kept, and the drums of machines should be formed accordingly, in order fully to effect their work, and at the same time to enable the horses to do a good day's labour without too much fatigue and inconvenience.

This machine will thresh, it is said, from twenty to thirty quarters of wheat in twelve hours in great perfection; from thirty to forty-five of barley in the same time; and from forty to fifty quarters of oats. It threshes every thing perfectly clean when the grain is in sheaves. But though it cleans the corn from chaff, as seen above, winnowing is required afterwards. It was seen with one feeder to thresh twenty-two large and long sheaves in three minutes, without any variation in the ordinary movement of the horses. This machine was constructed by Elliott of Hexham, in Northumberland, and cost about 200*l.*, without the expences of fitting up, &c.

It is stated, in the Essex Agricultural Report, that Mr. Newman of Hornchurch has a threshing-mill which was built by two young millwrights from Somersetshire, in which there are two new circumstances of improvement, one of which is a movement so prepared, as that the person who

feeds the mill, by putting his foot on a pedal can lift one of the fluted cylinders out of its work, so that the wheat-ears having been advanced far enough to be threshed, the straw may be drawn back again and be prevented from being broken; the other is a click, or iron, which admits the horses to be stopped suddenly without stopping the beaters; by which the connection is removed for a moment, so that one operates without the other: this is of capital importance in working the machine. Representations of these improvements are given in the above work.

These machines have occasionally grinding-mills combined with them, and are in this way found very convenient and advantageous. The Hon. Newton Fellows, in Devonshire, has been at very great expence, it is said, in erecting a threshing-mill connected with one for grinding, both of which are wrought by a never-failing stream of water. The power of this mill or machine is said to be calculated as equal to sixteen horses. And together with its power and capability for threshing, winnowing, and dressing every kind of corn, the pair of stones for grinding attached to it are about four feet in diameter, to which a bolting-machine or apparatus is added.

In working, this threshing-machine is capable of discharging about twenty-five bushels of wheat, and nearly forty bushels of barley or oats in the hour. The barn, or place where the machine is placed, being filled with the wheat or other corn; the manual assistance for performing the business is distributed through it in this manner: one man and two women for unbinding the sheaves of corn and feeding the rollers, which last are grooved and divided into lengths of six or eight inches: on the straw being discharged from the machine, one person attends to shake it well over a large open screen, whence it is tossed over to another person, who removes it out of the way. At and under each of the winnowing-machines, sieves are placed to receive the grain coming directly from the machine, which is then put into the hopper of the fan of the second winnowing-machine, from which it is again received into another sieve, and thence discharged into the hopper for grinding, for the market, or for other purposes: in passing through this little fan, such a separation takes place as completely to divide the head from the tail corn. A cylindrical pearl-barley machine or apparatus is also applied and used to cleanse the wad of its smut, and thus by taking off the downy end of the grain, a much finer sample of both wheat and flour is obtained. This is preferred to the brush apparatus; for although that may cleanse the body of the grain, it will not carry off the down from its end, which may reasonably be supposed to contain the germ of smut, or to form the nest of other animalcula equally injurious to such grain when used as seed on lands.

There is in this machine only one labouring man employed to five women, which is an advantage of great importance in many situations. The introduction of such machinery as this is therefore of great benefit in bettering and improving the rural condition of the country.

But, besides machines of this sort being constructed for performing the different operations of threshing, winnowing, grinding, and bolting, they have sometimes contrivances for other purposes, as an iron hopper axis for grinding apples; and a contrivance for shelling clover seed, and the haddocks of wheat. These two additions belong to a threshing-machine of Mr. Vinns in the above district; and some others are occasionally met with in other places which are a little different in their nature, but unnecessary to be here described.

In the general construction of these machines, they are commonly,

THRESHING-MACHINE.

commonly, as has been seen, made of two descriptions, large and small kinds; the former of which probably not only perform their work more expeditiously, but in a more perfect manner, though their expence is an objection to them on small farms. They require very different strength of teams or other powers in working them, according to their sizes, the nature of their construction, and other circumstances.

It is stated, that in some large machines of this kind, the rollers take in about three hundred inches of grain in a minute. The medium length of the straw being estimated at about thirty inches, and supposing half a sheaf to be introduced into the machine at a time, the whole sheaf will be equal to sixty inches, and the machine, when supplied with a middling quantity of water, will thresh five sheaves in a minute. But in respect to the performance of these mills, much must depend on the attention with which they are fed, as a small neglect in this point will make a very considerable difference in the quantity of work that is performed in a given time.

In regard to the expence of these machines, it must depend upon the size and power which they possess of performing work, the number of other operations which they perform at the same time, and whether they be fixed or moveable. According to some persons well informed on the subject, a fixed mill that requires the power of two or three horses, will cost from sixty to a hundred guineas. This will thresh about fifteen quarters of wheat, and from that to twenty of barley, oats, peas or beans in the course of eight or nine hours.

It is noticed, that the only defect of machines worked by wind, upon their first introduction, consisted in the risk to which they were exposed, by stopping them to take in the sails, which could scarcely be done during a brisk gale: in that way it sometimes happened, that when the wind freshened considerably after the machine was set a going, either the sails were torn to pieces, or the arms broken off. That defect, however, is now remedied by a late invention of Mr. Mickle, by which the whole sails can be taken in, or let out, in less than half a minute, merely by a person pulling a rope within the house; by this contrivance the sails are, with ease and expedition, proportioned to any degree of wind, an uniform motion is produced, and all danger of straining or hurting the machine is avoided.

It is further observed, that the number of hands required for working one of these machines, is from five to six; but that this depends greatly on the construction of the machine, some of them being so contrived, that the work can be performed with much fewer hands.

It is, however, noticed in the Agricultural Survey of Norfolk, that a machine erected by Mr. Johnson, at Lempston, appears to be one of the best, if not the very best, of the larger kind that has yet been met with. The movements in it are uncommonly smooth. It requires from six to eight horses, six men, and one woman; it threshes, without any question, much cleaner than the flail, and, without any doubt, cheaper. To bring it to its present perfection, as he was determined to carry his point, he never stopped till it worked to his mind; and having completed it, the repairs since have been quite trifling. The common complaint of their being always out of order is attributed to original errors or inattention in the construction of them. The arrangement is excellent, it is said, in this machine, for disposing of the chaff, colder, straw, and corn, at once, in their respective places, without any confusion or after-removals; and it takes up a very small part of a barn. It was built by Mr. Wigful of Lynn.

Mr. Whiting, of Fring, has also a large threshing-mill, built by Mr. Fordyce, an engineer from Scotland. It cost him 200*l.*; is worked by six horses; threshes twenty-four coombs of wheat in the day, fifty-five of barley, and from sixty-three to eighty-four of oats. It has five beaters on the drum-wheel, and the fluted segment of a cylinder which covers the drum in two parts, with an unfluted plate between them, which is raised or sunk by a short lever: this is a guard against stones getting in. In another circumstance also it is singular; there is a long platform, with a rolling cloth bottom: the whole raised or sunk at pleasure, for delivering the corn, across the floor space of the barn, from the goff in which the corn is stacked, to the other end in which the mill is built; which saves much labour, and works to his satisfaction.

The horse-wheel is here upon a different construction from the common ones, working by a cogged-wheel of small diameter below, instead of above the horses; and the communicating spindle under their path; but it is said to be hard work.

And Mr. Coke, of Holkham, is stated to have a very large machine, which cost about 600*l.* Besides threshing, it grinds corn, works two chaff-cutters, and breaks oil-cake. It threshes sixty-four coombs a day.

Mr. Reeves, of Heverland, has a threshing-mill which is, the writer thinks, still nearer to perfection than any other he has seen; it was made by Asbey, works with two or three horses, and cost a hundred guineas. He found it at work, threshing oats; it does for barley as well as for any other grain, threshing thirty-two coombs in a day of seven hours and a half; more of oats; forty of peas; and thirty of wheat: its day's work of wheat, threshed the day before he saw it, was thirty-one coombs, which were standing sacked in the barn. It varies considerably in the beating-drum cylinder from the others he has seen, it being of a much larger diameter, and has eleven beaters.

At Brightwell-Grove, in Oxfordshire, according to the Agricultural Report of that district, there is a threshing-machine, belonging to Mr. Lowndes, which was constructed by Raltrick, and in which there is some novelty of contrivance: it works by means of four horses: the drum-wheel, in this case, is three feet and a half in diameter, makes two hundred and sixty revolutions in a minute, and, having sixteen beaters, it gives 4160 strokes in that time: there is a rake with four sets of teeth which takes the straw, and delivers it to a second drum-beating cylinder two feet in diameter. This drum is termed the dresser, and turning in an opposite direction to the motion of the straw, beats it down, and in its descent strikes it against a circular board, faced with bars shod with iron, through the space of eighteen inches, by which the straw receives several additional strokes, which, it is conceived, have a great effect in dislodging that corn which has not been completely separated in passing the principal drum. This is the addition not usual in these machines. These are wrought four hours at a time, in which eight quarters of wheat are threshed out. Every thing is threshed perfectly clean; and the straw is not broken more than by the flail. Twelve quarters of barley are threshed in four hours, and sixteen have been done in that length of time. The horses, in this machine, are not attached in the draught, in the manner which resembles pushing, by advancing with the lever before them, but in the common drawing method, with the lever behind them, in which way they are supposed by some to do the work much better.

This machine was seen to thresh forty-three sheaves in ten minutes. It dresses at the same time; and there is a chaff-cutter,

THRESHING-MACHINE.

cutter, as well as a corn grinding-mill with stones, for farm use, attached, and wrought or not, at pleasure.

It is perhaps only in places situated in the immediate vicinity of a colliery, and where, from the cheapness of fuel, they are capable of being worked at a very trifling expence, that steam can be had recourse to as the moving power of these machines. See STEAM, and STEAM-Engine.

With regard to small machines, it is said in the East Lothian Agricultural Report, that they have been introduced there, upon a reduced scale, at a price so low as 40*l.*: that these small machines, having little work to do, and that little being, in general, done slowly, answer the purpose tolerably well; but though cheaper in the first instance, they are, in the end, more expensive than larger ones, a certain degree of strength being absolutely requisite to do the work perfectly. If the parts of the machine are below that degree of strength, the work is either ill done, or the machine is destroyed, by being exerted above what it is able to bear.

The writer of the Essex Agricultural Survey too states, that in that district at present many are made by Balls of Norfolk, the price fifty guineas, and do their work very clean and well for all sorts of corn, but do not dress. They have been applied to white clover, and have done it to the satisfaction of the growers, by passing it through twice or thrice. In one erected by Mr. Vaizey, which is worked by horses, one man feeds, two supply, a boy drives, and two men clear away the straw. He has threshed sixty quarters of wheat with it in eighteen hours. It cost 52*l.* 10*s.*, and 10*l.* putting up; the shed added about 20*l.*, two winnowing machines 15*l.* 15*s.*; in all, complete, about 100*l.* But in this a greater number of horses are used than are noticed above. The owner has no fault to find with its performance, but is very well satisfied with it. He has applied it to cobbing white clover with great success; by passing it thrice through the mill, he got from three jags, seven bushels of clean seed in four hours. And one built by Dickson of Ipswich, for Mr. Sanxter, goes with two or four horses, and cost fifty guineas. It is supposed that it will thresh twenty quarters of wheat *per diem*. But it is now fifty-five guineas, put up and ready to work. Two horses work it, without hard labour. The last year's wheat, which was very badly threshed at 7*s.* *per* quarter, was done by this machine perfectly well. Also at Little Wakering, Dr. Asplin has a machine which the writer saw working with one horse, which moved with great ease, driven by a little girl; one man and two boys work it, and it does three quarters of wheat in a day. The writer examined the straw for about a quarter of an hour, and did not find a single kernel in it. The price is sixty guineas. The construction in this machine varies from the others he has seen, in the wheels which communicate the motion. The doctor threshes only wheat with it, though it will do for all sorts of grain. He thinks it answers greatly, and is perfectly satisfied with it. It was made by Turbot, Bankside, Westminster, but they are now made by Jones, Clement's-Lane, Clare-market, London.

There are many other persons who put up these machines at an equally reasonable rate, and so as to work with much perfection.

Where machines of this sort cost about one hundred guineas, the annual expence in interest of capital and repairs cannot be more than from 10*l.* to 12*l.* at most, except in the expences of teams and the labour of the persons employed in the execution of the business and work about them.

The expensive machines which have rollers for rubbing

out the grain instead of beaters, are thought in general to perform the business in the most perfect manner, though they require more power to work them.

It is, however, thought by some to be utterly impossible to build threshing-machines which will do justice to the owners for any such sum as 50*l.*, or thereabouts, as their durability and success depend materially on their firmness, strength, solidity, and other circumstances of the same nature, which are by no means attainable for any such money. Yet many of these small machines of one or two horse power, are said to perform their work well, and at the rate of six quarters of wheat, and the relative proportions of other sorts of grain, in the course of the day. They are stated to be made in several different districts, at the prices of from thirty to fifty guineas, so as to thresh well at nearly the above rate, and to have, in some instances, other additions, such as chaff-cutters, &c. made to them. In particular cases, they are thought not to break the wheat-straw so much as the flail; and though wheat and beans are mostly well threshed by them, barley is under the necessity of being often twice passed through such machines, as seen above. They do not dress in general; but sometimes head feed clover in a pretty perfect manner, as noticed already.

Small threshing-machines have likewise been constructed so as to be wrought by hand, in some districts, both in the northern and southern parts of the kingdom, and been asserted by some to perform their work in a clean and satisfactory manner; but from their mostly wanting that degree of velocity, in being wrought in this manner, which is essential to good work of this kind, they have not yet become in any way general. Indeed, in some districts in the south, the working of them by the hand not being found to succeed well in actual practice, the usual feeding rollers have been applied with the horse-tackle, at the additional charge of about 20*l.*, which has enabled them, it is said, to do the work properly, and in an easy manner, even by the power of one horse. Where the teeth of the iron wheels in such machines have been found too fine for the increased force made use of in this way, vertical wooden wheels and pinions have been put in their place, which have contributed to the strength and preserved the simplicity of the machinery.

Threshing-machines have now been known, and in some measure employed, in the northern parts of this country for more than half a century, and are at present very general in those that are any way improved; but in the more southern districts, they have only been attended to, in any considerable degree, for the space of the last thirty or forty years, yet their use and application are fast becoming general among the more extensive farmers whose farms are of the arable kind. In short, it is not improbable but that in a little time the machine will be the most prevalent method of threshing out corn. And it has been suggested, that parish machines of this nature, in central situations, would perhaps not be less useful or convenient than parish mills, while, at the same time, they might be easily so regulated as to be rendered of great general benefit to the community, as well as advantageous in the way of private speculation to individuals. Something of this sort is said to be already the case in some districts of the North, and would, it is believed, be desirable in all, for the convenience and accommodation of the small farmer; as the same conveyance that brought the corn to be threshed, might take back the straw and grain, and in this way little waste of labour or time be sustained, while the saving would be considerable and certain.

It may be noticed also, that in all cases where threshing-machines are made use of, they should be well suited to the

extent of the farms, and be erected in such a manner as to be convenient for having the contents of the stacks brought to them. In this view it has been suggested, in the Report on Agriculture for the West Riding of Yorkshire, that the barns to which they are attached should extend into the yards in which the stacks are contained; as in that way the labour and time will be considerably lessened of supplying them with corn in the straw for being threshed. And it has been justly remarked, by an intelligent promoter of agricultural improvements, that this machine has not been attended with one-half of the advantage which might have flowed from so useful a discovery, for want of combining the use of it with the various connected circumstances of the farm-yard. The business of stacking corn, for instance, must, it is conceived, receive an entirely new arrangement in consequence of building a threshing-mill or machine. By means of no other additional expence than that of an iron railway, and placing the stacks on frames resting on block-wheels, two feet in diameter, a very considerable annual expence in time and labour must, it is supposed, be saved in carting stacks to the barns, in loss of corn, and in waiting for good weather, as well as in the saving of threshing by flails, and all the attendant evils of pilfering and leaving corn in the straw. This is a material object, which it is thought cannot receive too much attention from both landlord and tenant. It is contended that there cannot be the smallest doubt of the propriety or profit of having one of these machines fixed in the principal farm-yard. But that where the farm is large, and stacks consequently scattered over various fields or parts of it, then it may be right to have a moveable one also; but so many operations are wanting at home, that one should certainly be fixed. The circular form of the railway upon which the stacks are brought to the mill or machine, is considered necessary in such cases, as being the only one which permits a choice of any particular stack to thresh, without waiting for all or many others being done before it can be got at; but a straight line leading to and past the mill or machine is admissible, except for this circumstance, though much inferior, in some other points, to the circular form. In forming this plan, a sort of railway should be so contrived as that a horse or two may be sufficient to draw all common stacks to the mill or machine. And it is directed that the wooden stumps on which the frame rests should be tinned, or laid in the common manner with brass latten, which is more durable than common tin, to keep out rats. Also, that as the power applied to the threshing-mill in other ways is at hand, and applicable also to the above sort of work of drawing the stacks, it may be used for the purpose in many cases.

THRESHING-Mill Barn or Building, that sort of barn, shed, or other building which is calculated for receiving, or which contains this kind of mill or machine.

In this intention, an upper floor, raised eight, nine, or ten feet from the ground, in proportion to the height or size of the animals, and the arrangement of the machinery which is to be employed, will be required, and which should reach from end to end of the barn or building, as a repository for the unthreshed corn, which should be there lodged and deposited, at leisure times, from the stack-yard, or other places, in order to be ready to feed the mill or machine with from this upper floor. The ground-floor should contain the large mill-wheel, and a horse-path round it, all the lower parts of the machinery, a dressing-room for the grain, and a wide open space for straw of different sorts, which is there to be piled up, ready for the cattle-sheds, on each side of this repository of fodder.

The expences of these prepared barns or buildings, will

probably not only be much lessened, but wholly done away, in some cases, by the use of the threshing stack farm-yard, which has been described in speaking of the mills or machines for this use, and much convenience and accommodation be thereby gained to the farmer in the dispatch of the business, &c.

On the whole, by these means the labouring teams and hands will be enabled to perform the work of threshing at such wet, stormy, and leisure periods as will render it the least troublesome and expensive to the farmer. See *THRESHING-Machine*.

THRIFT, in *Botany*. See *STATICE*.

THRIHING. See *TRIHING*.

THRIMSA, in *Antiquity*, a silver coin, the value of which has occasioned a variety of conjectures. Lambard, who gave the first estimate of it, makes it a three-shilling piece, in which opinion he is followed by sir Henry Spelman. Bishop Nicholson apprehends, that it was the name of their common coin, and that the thrimsa, sceata, and penny, were all of them the same. Somner, from the import of the word, and the value given to the thrimsa in the Saxon laws, rates it at three-pence. Selden, Brady, and Hickes, are of opinion, that this coin was either the last tremissis of the Franks and Germans, and consequently four-pence, or the third part of the Saxon shilling, *i. e.* three halfpence and one-third of a halfpenny in their money. Mr. Clarke adopts, and endeavours to establish the opinion of Somner, who observed, from the laws of Athelstan, that the price of a thane's life was, by the Angli, valued at 2000 thrimsas, which, by the Mercian estimate, was 1200 shillings; and if each of these sums denotes the same value, which is probable, the thrimsa must be to the shilling as 2000 is to 1200, or three parts in five of a Saxon shilling, *i. e.* three-pence.

The thrimsa was first coined in the reigns before Athelstan, during their greater affluence in cash, and designed merely for the convenience of exchange, as the most proper division that could be made in their money without a fraction, between the shilling and the penny. But when the shilling was reduced, it was of little use, and by degrees entirely laid aside.

Dr. Hickes observes, that the method of computing by thrimsas was chiefly used in the more mercantile parts of this kingdom, among the East and West and South Saxons, and possibly coined only among them; for it appears that the inland provinces, the Mercians, reckoned generally by the shilling. Clarke's Conn. of the Roman, Saxon, and English Coins, p. 229, &c.

THRIN, in *Geography*, a river of Norfolk, which joins the Yare at Yarmouth.

THRINAX, in *Botany*, θριναξ, a fan, in allusion to the form of its leaves; a name bestowed by the younger Linnaeus on the little Fan Palm of Jamaica, when he first distinguished this plant generically from *Corypha*, to which it had been referred by Browne. To that genus it is, as Swartz observes, very closely allied, differing chiefly in the want of a corolla.—Swartz Prodr. 57. Ind. Occ. v. 1. 613. t. 13. Schreb. Gen. 772. Willd. Sp. Pl. v. 2. 202. Mart. Mill. Dict. v. 4. Ait. Hort. Kew. v. 2. 307.—Class and order, *Hexandria Monogynia*. Nat. Ord. *Palme*.

Gen. Ch. *Cal.* Perianth inferior, of one leaf, minute, hemispherical, with six small, erect, marginal teeth. *Cor.* none. *Stam.* Filaments six, erect, equal, thread-shaped, about

about twice the length of the calyx, inserted at the base of the germen; anthers terminal, erect, linear, longer than the filaments, cloven at each end. *Pist.* Germen half immersed in the base of the calyx, ovate; style cylindrical, thickish, erect, the length of the filaments; stigma very large, funnel-shaped, oblique, of a single, dilated, ovate, rather tumid, lip, finely crenate at the margin, rarely accompanied by another lip. *Peric.* Drupa small, globular, naked, rather dry. *Seed.* Nut solitary, large, globose, brittle, of one cell, with a solitary kernel.

Eff. Ch. Calyx with six teeth. Corolla none. Stigma funnel-shaped, oblique. Drupa globular, with a single seed.

1. *Th. parviflora.* Small Jamaica Fan Palm; Palmetto Royal; or Palmetto Thatch. Willd. n. 1. Ait. n. 1.—Native of the sea-coast, and other barren dry situations, in Jamaica and Hispaniola. *Swartz.* The stem is from ten to twenty feet high, unarmed; tumid at the base. Leaves collected about the top, stalked, from one to two feet long, palmate, plaited like a fan; their segments lanceolate, ribbed and streaked, rigid, nearly equal. *Footstalks* longer than the leaves, roundish, somewhat compressed, smooth, flexible, unarmed. *General Sheath* compound. *Flower-stalk* terminal, solitary, nearly erect, two or three feet long, panicled, imbricated with *partial sheaths*, or *bracteas*; its branches alternate, subdivided, spreading; the ultimate ones opposite or ternate, crossing each other. *Flowers* stalked, opposite or ternate, small, perfect. *Anthers* yellow.—Brown says, Hist. of Jamaica, 191, this tree covers whole fields in many parts of that island, thriving better on the rocky hills, than on the low moist plains near the sea. The copious little berries serve as food for birds and wild beasts. The trunk, seldom more than four or five inches in diameter, ten or fourteen feet high, is called the *Thatch-pole*, and is much used for piles in wharfs and other buildings made in the sea; for it stands the water well, and is never corroded or touched by worms. The split footstalks make baskets, bow-strings, ropes, &c. being very strong and tough. The leaves are called *thatch*, and are used as such, for outhouses especially, being found to resist the weather for many years. Such coverings of buildings have only the inconvenience of harbouring rats or other vermin, which prevents their general use.

THRINCIA, so called by Roth, from *θρινος*, the *battlement of a wall*, to which he compares the seed-crown of the marginal florets. The Italian name *Trinciarella*, used by Camerarius, *Hort. Med.* 173, for *Hyoseris radiata*, may, as Dr. Roth supposes, have a similar origin; but it comes directly from the Italian verb *trinciare*, to cut, alluding to the remarkable segments of the leaf in that plant.

This genus of *Thrinicia* consists of two species, *Leontodon virtum* of Linnaeus, and *Hyoseris taraxacoides* of Villars, excluding the synonyms of the latter. We see no occasion to separate them from *Apargia* of Schreber and Willdenow, the *Hedypnois* of Hudson. Having, in the *Prodr. Fl. Græc.* v. 2. 142, adopted HEDYPNOIS; and in p. 130 of the same volume, APARGIA; we refer the reader to the former in its proper place, and shall here introduce the latter, with its full characters and synonyms.

APARGIA, *Ἀπαργία*, an ancient Greek name, with whose original meaning, or application, we are unacquainted. Dalechamp has applied it to something of the *Hieracium* kind; and Schreber, after Scopoli, to the genus now before us, with which we hope it will remain.—Schreb. Gen. 527. Willd. Sp. Pl. v. 3. 1547. Mart. Mill. Dict. v. 4. Ait. Hort. Kew. v. 4. 445. Sm. Prodr. Fl. Græc. Sibth. v. 2. 130. Compend. Fl. Brit. ed. 2. 117. Marsch. a Biebertf. Caucas. v. 2. 247. (*Hedypnois*; Hudf. Fl. Angl. 340.

Sm. Fl. Brit. 823. Leontodon; Juss. 170. Thrinicia; Roth. Catal. v. 1. 97. Willd. Sp. Pl. v. 3. 1554. Ait. Hort. Kew. v. 4. 447. Virea; Gærtn. t. 159.)—Class and order, *Syngenesia Polygamia-aqualis*. Nat. Ord. *Compositæ semiflosculosæ*, Linn. *Cichoraceæ*, Juss.

Gen. Ch. Common Calyx oblong, permanent, imbricated, of several linear, parallel, unequal, longitudinal, incumbent scales; those at the base very small. *Cor.* compound, imbricated, uniform; the florets numerous, all perfect, equal, monopetalous, ligulate, linear, abrupt, with five teeth. *Stam.* Filaments five, capillary, very short; anthers united into a cylindrical tube. *Pist.* Germen nearly obovate; style thread-shaped, the length of the stamens; stigmas two, recurved. *Peric.* none, except the permanent, straight calyx, at length reflexed. *Seeds* solitary, oblong, striated, crowned with sessile feathery down, somewhat chaffy in the lower part, and often unequal in the marginal florets; somewhat stalked in the central ones, frequently accompanied by shorter hairs or plumes. *Recept.* dotted, naked, or very slightly hairy.

Eff. Ch. Receptacle naked, dotted. Seed-down feathery, sessile, unequal. Calyx imbricated, with small feathered scales at the base.

This genus, though very natural and well defined, has the general habit of *Hedypnois*, or of *Hieracium*, agreeing with the latter in having some caulescent species, though in most the *flower-stalks* are radical and single-flowered. The leaves are variously toothed or sinuated, mostly hairy, rarely villos. *Flowers* of a full yellow. *Root*, except in our thirteenth species, perennial, tuberous. We adopt the English name of Hawk-bit from Petiver.

1. *A. aurantiaca.* Orange-coloured Hawk-bit. Willd. n. 1. "Waldst. et Kitaib. Hung."—"Stalk radical, single-flowered, naked; tumid and hairy in the upper part. Calyx hispid. Leaves lanceolate-oblong, slightly toothed."—Found on the lofty mountains of Hungary. Leaves three or four inches long, smooth. Stalk six inches high, smooth, except just below the flower. Calyx clothed with rigid blackish hairs. Corolla orange-coloured. Seed-down sessile, feathery. It differs from the next in having no scales on the stalk, which is more tumid in its upper part; very smooth leaves; and a different-coloured flower. Willd.

2. *A. alpina.* Alpine Hawk-bit. Hoff. Syn. 423. Willd. n. 2. (*Leontodon alpinum*; Jacq. Austr. t. 93. L. pyrenaicum; Gouan. Illustr. 55. t. 22. f. 1, 2. Hedypnois pyrenaica; Villars Dauph. v. 3. 78, from the author. Picris faxatilis; Allion. Pedem. v. 1. 211. t. 14. f. 4. Taraxacum foliis integris dentatis, calyce hispido, pappo plumoso; Hall. Helvet. ed. 1. 741.)—Stalk radical, solitary, single-flowered, scaly; slightly tumid, and somewhat hairy, at the top. Calyx hispid. Leaves lanceolate-oblong, slightly toothed, somewhat hairy.—Native of grassy pastures, on the Alps of Austria, Switzerland, Dauphiny, and Italy. Haller found it on mount St. Gothard, Schleicher on mount Fouly, and the late Mr. Davall on St. Bernard. Our synonym of Haller's first edition, misquoted by Willdenow, rests on the authority of Allioni. We do not find the plant in his subsequent publications. The root is tuberous, perennial, with long fibres. Leaves from three to eight, radical, stalked, erect, obtuse, two or three inches long; tapering at the base; distantly toothed about the middle or lower part: rough, with shaggy short hairs, particularly about their rib and footstalk; which latter is sometimes red or purple. Flower-stalk from three to ten inches high, slender, erect, bearing a few scattered linear scales, and one yellow flower, hardly so big as our common Dandelion, whose calyx-scales are narrow, black with shaggy hairs.

THRINCI A.

3. *A. crocea*. Saffron-coloured Hawk-bit. Willd. n. 3. (*Leontodon croceum*; Haenke in Jacq. Coll. v. 2. 16.)—"Stalk radical, solitary, single-flowered, slightly scaly; tumid and hairy above. Calyx hispid. Leaves smooth, runcinate, with a triangular terminal lobe."—Gathered by Haenke on the alpine heights of Judenberg, in Upper Stiria, where it inhabits dry, open, barren pastures, but is elsewhere rarely to be seen. This is said by Willdenow to be like the preceding, but different in the above-described figure of its leaves, which are only sometimes hairy. Flower an inch and half, or two inches, in diameter, very handsome, and readily distinguished from all the surrounding species of its own tribe, by its colour, which is that of tincture of saffron.

4. *A. hastilis*. Shining Spear-leaved Hawk-bit. Hoff. Syn. 423. Willd. n. 4. Ait. n. 1. (*Leontodon hastile*; Linn. Sp. Pl. 1123. Jacq. Austr. t. 164. L. protheiforme B & C; Villars Dauph. v. 3. 87. Picris, n. 26; Hall. Helvet. v. 1. 12.)—Stalks radical, single-flowered, smooth as well as the calyx. Leaves obovato-lanceolate, smooth, with numerous slightly hooked teeth.—Native of the south of Europe; very abundant in Switzerland. The leaves are often a foot long, tapering at the base into purplish, flat, winged footstalks; their surface smooth, even, and somewhat glaucous; their margin cut into many deep, acute, triangular teeth, partly hooked backward. Stalks several, round, very smooth, glaucous, very rarely divided, twelve or eighteen inches high. Flower bright yellow, an inch and half wide, with scarcely any perceptible hairs on the calyx; drooping when in bud. Sometimes the flower-stalks bear a few linear distant scales.

5. *A. dubia*. Doubtful Hawk-bit. Willd. n. 5.—"Stalk single-flowered, radical, nearly naked; hairy, as well as the calyx, above. Leaves lanceolate, toothed at the base, slightly clothed with forked hairs."—Communicated to Willdenow by Hoppe, from the Salzburg alps, under the above name, which seems to us but too well applied. We have not indeed seen a specimen of this plant. Willdenow describes it as intermediate between the last and *A. hispida*. The stalks are mostly furnished with one small scale, and are tumid under the flower, whose calyx, as well as the upper part of the stalk, are beset with short forked hairs. The leaves seem smooth at first sight, but bear scattered, white, forked hairs.

6. *A. tuberosa*. Knotty-rooted Hawk-bit. Willd. n. 6. Ait. n. 2. Sm. Fl. Græc. Sibth. t. 797, unpubl. (*Leontodon tuberosum*; Linn. Sp. Pl. 1123. Dens leonis bulbosus; Ger. Em. 290. Chondrilla altera Dioscoridis, &c.; Lob. Ic. 232.)—Stalks radical, single-flowered, naked, somewhat hairy. Calyx hairy. Leaves pinnatifid, runcinate, somewhat lyrate, rough with forked hairs. Root of many ovate tapering knobs.—Native of the south of Europe and the Levant; very common in the sandy meadows of Greece, Cyprus, and Zante. The modern Greeks name it *radix*, or *radix*; and it may be, as some old botanists have thought, the *κονδριλλη έλεμα* of Dioscorides, but this is hard to determine. The perennial root is a cluster of sessile ovate knobs, above an inch long, tapering into radicles. Leaves numerous, spreading, dark green, obtuse, either simply runcinate, with a large terminal lobe, or deeply, sometimes interruptedly, pinnatifid, and bluntly toothed. Flower-stalks several, a span high, ascending, striated, more or less hairy; purple, like the footstalks, at their base. Calyx slender, with acute scales. Flowers above an inch wide, full yellow; red underneath.

7. *A. incana*. Hoary Hawk-bit. Scop. Carn. v. 2. 113. Willd. n. 7. Ait. n. 3. (*Hieracium incanum*;

Jacq. Austr. t. 287. Linn. Sp. Pl. ed. 1. 799. *H. sextum montanum*; Clus. Hist. v. 2. 141. Ger. Em. 302. *Leontodon hispidum* β; Linn. Sp. Pl. ed. 2. 1124.)—Stalks radical, single-flowered, almost naked, hoary as well as the calyx. Leaves lanceolate, erect, very minutely and sparingly toothed, hoary with starry hairs.—Found on hills and mountains in Germany, Switzerland, Carniola and France. The root is long and woody, divided at the crown, where it bears several tufts of straight, upright, more or less acute, very hoary, leaves, tapering at the base, from three to five inches long, with a few little, marginal, glandular teeth. Stalks often solitary in each tuft, a foot high, swelling at the top. Flowers light yellow, an inch and a half broad. Calyx-scales narrow, acute. The uniformly entire leaves, though beset with a few glandular teeth, and the structure of most other parts, when minutely examined, render this plant sufficiently distinct from *A. hispida*, hereafter described, with which Linnæus subsequently confounded it as a variety.

8. *A. Taraxaci*. Dandelion-leaved Hawk-bit. Willd. n. 8. Ait. n. 4. Compend. Fl. Brit. n. 3. (*Hedypois Taraxaci*; Villars Dauph. v. 3. 80. t. 26. Fl. Brit. 825. Engl. Bot. t. 1109. *Hieracium Taraxaci*; Linn. Sp. Pl. 1125. Retz. Obf. fasc. 4. 30. t. 2. Lightf. Scot. 435. Picris n. 27; Hall. Hist. v. 1. 12. P. *Taraxaci*; Allion. Ped. v. 1. 211. t. 31. f. 1.)—Stalks radical, mostly single-flowered; tumid and hairy at the top. Leaves smooth, with recurved teeth. Calyx hairy.—Native of watery pastures on the loftiest mountains of Lapland, Scotland, Wales, Switzerland, Savoy, and Dauphiny, flowering in July or August. Root abrupt, with long lateral simple fibres. Herb very variable in the breadth of its leaves, as well as the number, height and luxuriance of its flower-stalks. The former are either lanceolate, and almost linear, or spatulate and obovate, sharp or blunt, from two to four inches long, with shallow or very deep, always runcinate, teeth. The latter are ascending or erect, solitary or in pairs, sometimes, though rarely, divided, naked or furnished with a few linear scales, shaggy with black hairs at the top, as is likewise the broad and thick calyx. Flowers an inch broad, or more, of a full yellow, with brownish terminal feet. Germen furmounted with a taper neck, like a stalk, but as the seed swells, this appearance vanishes, and the feathery down is truly sessile. Receptacle naked. Willdenow justly remarks, that Gouan's synonym is misapplied to this species in the *Fl. Brit.* We have now quoted it more correctly under our second *A. alpina*, to which some of the slender varieties of the present bear a great resemblance. Solander, as well as Linnæus, thought this plant a mule between *Hieracium alpinum* and *Leontodon Taraxacum*, merely because its flowers resembled one, and its leaves the other. The generic character differs from both.

9. *A. autumnalis*. Autumnal Hawk-bit. Hoffm. Germ. for 1791. 274. Willd. n. 9. Ait. n. 5. Compend. Fl. Brit. n. 4. (*Hedypois autumnalis*; Fl. Brit. n. 4. Engl. Bot. t. 830. *Leontodon autumnale*; Linn. Sp. Pl. 1123. *Hieracium minus*; Fuchs Hist. 320. *H. minus*, five leporinum; Ger. Em. 296.)—Stalks radical, branched; their ultimate divisions scaly. Leaves lanceolate, toothed, or pinnatifid, smoothish.—Native of meadows and pastures throughout Europe, flowering in autumn; very common in Britain. The root is abrupt, with very long and copious fibres. Leaves numerous, variously and unequally pinnatifid, or merely toothed, rarely a little rough or shaggy, oblique, or somewhat serpentine, in their general form or position. General stalks one or more, a foot or two in height, spreading, curved and zigzag, alternately branched, not quite without pubescence, terminating in a few long scaly

partial

THRINCIA.

partial stalks, which are hollow, and each contains a peculiar tuft of very white cotton, remarked by the Rev. Mr. Holme. *Calyx*, and top of each *stalk*, a little downy. *Flowers* bright lemon-coloured, hardly an inch broad, often reddish on the outside. *Seeds* slender, all crowned with feathery down. Sometimes the *flowers* are prolific, like the Hen-and-chicken Daisy.

10. *A. crispa*. Curled Hawk-bit. Willd. n. 10. Ait. n. 6. (Leontodon crispum; Villars Dauph. v. 3. 84. t. 25. Hieracium alterum faxatile montanum; Column. Ecphr. 244. t. 243. H. parvum hirtum, caule aphylo, crispum ubi siccatum; Bauh. Hist. v. 2. 1038.)—Stalks radical, almost naked, single-flowered, hairy as well as the calyx. Leaves with various divaricated teeth and segments, rough with dense three-forked hairs. Seeds with a rough elongated beak.—Native of rocks in Dauphiny, Switzerland, and Italy.—The *root* is said to be very long, thrusting itself deep into the scarcely visible clefts of large rocks, and sending forth many long, simple, lateral fibres. *Leaves* numerous, in dense spreading tufts, from two to four inches, Columna says more than six, in length, pinnatifid in a rather lyrate manner, some of their segments or teeth turned various ways, especially, as J. Bauhin observes, when dry; they are densely clothed, on both sides, with prominent hairs, whose peculiarly white tips have three or more spreading forks or points. *Flower-stalks* ascending, a span high, furrowed, bearing a few linear scales near the top. *Flower* full an inch broad. *Seeds* uniform, each terminating in a long, tapering, brown, minutely rough beak, which looks like a stalk to the dense feathery down. This species comes very near the following, but appears to be essentially distinguished by the beak of the seeds. Villars confounds its synonyms with those of *A. hirta*, which differs very materially in having a scaly short crown to its marginal seeds, as will hereafter be described.

11. *A. hispida*. Rough Hawk-bit. Willd. n. 11. Ait. n. 7. Compend. Fl. Brit. n. 1. (Hedypnois hispida; Fl. Brit. n. 1. Engl. Bot. t. 554. Leontodon hispidum; Linn. Sp. Pl. 1124. Curt. Lond. fasc. 5. t. 56. Fl. Dan. t. 862. Hieracium dentis leonis folio, hirsutum; Ger. Em. 303.)—Stalks radical, naked, single-flowered. Leaves with reversed teeth, rough. Florets hairy at their orifice; glandular at the tip. Seeds scarcely beaked.—Very common in meadows, pastures, and waste ground, throughout Europe, from Sweden to Greece, flowering in summer. The *root* is tapering, zigzag, long and slender. *Leaves* oblong, more or less deeply toothed, or in some measure pinnatifid, their teeth acute, pointing downwards; they are much less densely hairy than those of the last, their hairs generally simply forked only; but we are aware of the uncertainty of this character. *Stalks* several, upright, striated, clothed with similar hairs. *Flowers* drooping while in bud; afterwards erect, bright yellow, an inch and half broad. *Calyx* hairy; its outer scales lax and scattered. *Florets* with a tuft of long yellow erect hairs, at the top of their tube externally; their summit terminates in five teeth, at the back of each of which Mr. Sowerby first detected a small triangular cluster of brown glands. These two characters serve admirably to distinguish the present species from every other British one, but the first of them, if not the other, is found in *A. crispa*. The seeds however have not near so long a beak as in that species, and they differ from *A. hirta* in being all uniformly furnished with a feathery crown. It is curious to trace an assertion of the seed-down being stalked in this species, published by Willdenow, taken from Haller, on the authority of Reichard. On turning to Haller, n. 25, we find he trusted to Berkhey, who, in his

Flores Compositi, t. 6. f. 10, has figured a seed, supposed to belong to the plant before us. On examination however its crown proves to consist of simple, not feathery, rays, and therefore it has nothing to do with any *Apargia*. We mention this circumstance, to shew the mischief of taking things for granted; not only in botanical criticism, but any other inquiry of the human mind.

12. *A. hirta*. Deficient Hawk-bit. Hoffm. Germ. for 1791. 274. Compend. Fl. Brit. n. 2. (*Thrinicia hirta*; Roth. Catal. v. 1. 98. Willd. Sp. Pl. v. 3. 1554. Ait. Hort. Kew. v. 4. 447. Hedypnois hirta; Fl. Brit. n. 2. Engl. Bot. t. 555. Leontodon hirtum; Linn. Sp. Pl. 1123. Curt. Lond. fasc. 6. t. 59. Rhagadiolus n. 7; Hall. Hist. v. 1. 5, with some doubtful synonyms.)—Stalks radical, naked, single-flowered. Leaves toothed, rough. Calyx nearly smooth. Outer row of seeds destitute of down.—Native of gravelly heaths and waste ground throughout Europe. Dr. Sibthorp gathered it, along with our violets and primroses, in Arcadia. Mr. Curtis observes that this species seldom occurs on the same spot with the preceding, of which Mr. Hudson made it a variety. Other botanists have found great difficulty in distinguishing them under all their various appearances, whilst Haller, and more recently Roth and Willdenow, have separated them generically. Linnæus thought the simple hairs of the plant before us afforded a good mark; but this is fallacious. The herbage of both is nearly the same, or at least their varieties closely approach each other. The *flowers* of both droop in the bud, but those of *A. hirta* are the smallest; their *florets* orange beneath, destitute of hairs about the orifice, and of glands at the summit. The most essential difference of all is found in the seeds of the circumference, which have no feathery down, but instead thereof a crown of short jagged scales. The *root* is abrupt, or bitten off, not tapering.

13. *A. annua*. Annual Hawk-bit. (*Thrinicia hispida*; Roth. Catal. v. 1. 99. Willd. Sp. Pl. v. 3. 1555. Hypoferis taraxacoides; Villars Dauph. v. 3. 166. t. 25, excluding the synonyms.)—Stalks radical, naked, single-flowered. Leaves lanceolate, toothed, rough with forked hairs. Calyx hoary and hispid. Outer row of seeds destitute of down: those of the disk beaked.—Native of Spain and France, in sandy ground. The annual fibrous *root* distinguishes this from all the other known species, and especially from the last, with which the short crown of its outer row of seeds agrees. The rest of the seeds however are elongated at the summit into a slender beak, which elevates the feathery down, as on a longish stalk, but is not really such. The rough and hoary calyx, and the brighter green of the leaves, are further differences. The name of *hispida* being preoccupied, see sp. 11, we are obliged to select a new one for the present species.

14. *A. Villarsii*. Villarsian Hawk-bit. Willd. n. 12. (Leontodon hirtum; Villars Dauph. 82. t. 25, excluding the synonyms.)—"Stalks radical, naked, single-flowered, nearly smooth as well as the calyx. Leaves deeply toothed, or pinnatifid, rough with simple awl-shaped bristles."—Native of dry sunny rocks in Dauphiny. Willdenow, who had a dried specimen, says the leaves are hoary with copious white hairs. We have not seen the plant, nor dare we attempt any illustration of it; Villars having so confounded various synonyms under this and his *Leontodon probeiforme*, p. 87. t. 24, that, even with some of his specimens before us, the descriptions are not satisfactory.

15. *A. caucasica*. Caucasian Hawk-bit. Marsch. a Bieberst. Caucal. v. 2. 247.—"Stalk radical, single-flowered, smooth. Calyx hairy. Leaves runcinate, rough, sparingly clothed with simple depressed hairs."—Native of grassy

grassy pastures on the Caucasian alps, flowering in August and September. *Root* perennial, abrupt. *Leaves* with triangular, nearly entire lobes pointing backward, besprinkled on the upper side with decumbent hairs, so sparingly that they seem altogether smooth. *Stalk* longer than the leaves, striated, naked except a minute scale or two; a little tumid and downy under the *calyx*, which is blackish, though hispid with whitish hairs. *Flower* of a full yellow. *Seeds* smooth to the naked eye; their down sessile, feathery. This plant has the habit and stature of *A. hispida*, n. 11, but differs in the want of hairs on the *stalk*, as well as in the form and position of the pubescence of the foliage.

16. *A. coronopifolia*. Bucks-horn-leaved Hawk-bit. Willd. n. 13. (*Leontodon coronopifolium*; Desfont. Atlant. v. 2. 229. t. 214.)—*Stalks* radical, single-flowered, scaly, shorter than the leaves, hairy as well as the *calyx*. *Leaves* pinnatifid, with blunt lobes, rough with forked hairs.—Native of the sandy deserts of Barbary, near Casfa. The whole plant is rough with branched hairs. *Leaves* three or four inches long, spreading on the ground, unequally, but rather regularly, pinnatifid. *Stalks* several, ascending, an inch or two high. *Flowers* yellow, an inch broad.

17. *A. hispanica*. Spanish Hawk-bit. Willd. n. 14. Marsch. a Bieberst. Cauc. v. 2. 248. (*Leontodon hispidum*; Cavan. Ic. v. 2. 39. t. 149, excluding the synonym.)—*Stems* leafy, mostly single-flowered, hairy as well as the *calyx*. *Leaves* oblong-lanceolate, toothed or pinnatifid, rough, with forked hairs.—Native of hilly situations in Spain, flowering the beginning of May. Frequent also in Tauria. This, as Willdenow remarks, differs as much as possible from *A. hispida*. The whole herb is even more rough or bristly than that species. *Stems* six inches high, furnished with lanceolate scales, accompanied by some oblong, obtuse, entire or toothed, *leaves*, an inch or inch and half long. The *radical leaves* are more numerous and longer, tapering at the base, gradually dilated upward, bluntly toothed, or in some degree pinnatifid. *Flowers* terminal, solitary, pale yellow, nearly an inch and half broad. *Calyx* with numerous long, narrow, very hairy scales. The hairs of the stem and other parts are white, sometimes forked.

18. *A. aspera*. Branching Rough Hawk-bit. "Waldst. et Kitaib. Hung. v. 2. 114. t. 110." Willd. n. 15. Ait. n. 8.—*Stem* leafy, somewhat branched, hairy. *Calyx* smooth. *Leaves* lanceolate, runcinate, hairy, with forked bristles.—Native of rocky woods in Hungary, near the baths of Hercules. Very nearly akin to the last, but the more branching *stem*, runcinate *leaves*, and smooth very close-pressed scales of the *calyx*, fringed at the edges only, not lax and hairy, appear sufficient, as Willdenow thinks, to distinguish this species.

19. *A. strigosa*. Bristly Hawk-bit. Marsch. a Bieberst. Cauc. v. 2. 249. (*Scorzonera asperima*; Willd. Sp. Pl. v. 3. 1507. *S. hispida*; Forsk. Ægypt.-Arab. 215.)—*Stem* leafy, hispid, bearing one or two flowers. *Calyx* hoary; the margin and keel of its scales fringed with bristles. *Leaves* lanceolate, toothed, hispid, with forked hairs. *Seeds* rough.—Native of dry open places in Iberia, and the eastern part of Caucasus, flowering in June. Forskall found it at Estac, near Marseilles. We have already described this under the article SCORZONERA, n. 32. The able author of the *Flora Taurico-Caucasica* says, "the *leaves* and *stems* are extremely hispid; the *calyx* only hoary, except the edges and keels of the scales. *Stems* bearing one or two *leaves*, and from one to three *flowers*, like *A. hispanica*. *Florets* pale yellow; the outermost purple beneath.

Seeds brown, linear, tapering much at the top, as in the *Scorzonera*; they are rough with minute prominent points. *Down* feathery. The habit of this plant, and its affinity to *A. hispanica*, n. 17, and *incana*, n. 7, make it rather an *Apargia* than a *Scorzonera*." We have seen no specimen. The regularly imbricated membranous-edged scales of the *calyx* in the latter, and the naked tips of its *seed-down*, are sufficient indications of that genus, and if not found in the present plant, there can be no doubt upon the subject; but of this we are left in ignorance.

20. *A. variegata*. Party-coloured Hawk-bit. Willd. n. 16. (*Hieracium variegatum*; Lamarck Dict. v. 2. 362.)—*Stem* nearly leafless, somewhat branched, shaggy. *Radical leaves* oblong, strongly toothed, hairy towards the edges. *Calyx*-scales spatulate, flat; downy at the base and margin.—Gathered by Commerçon at Monte Video. The *root* seems rather woody. *Stems* several, six inches high, each terminating in one large yellow or orange-coloured flower, and bearing several linear acute scales, with the rudiments of branches; but we find none of the pinnatifid stem-leaves mentioned in Lamarck. The numerous *radical leaves* are two inches long, tapering at the base, bluntish, with coarse blunt unequal teeth, green, not hoary; shaggy with simple bristly hairs about the margin and mid-rib on both sides. The dilated, obtuse, smooth scales of the *calyx* are more regularly and copiously imbricated than usual in this genus, and are prettily variegated with white marginal cottony down. The *seed-down* is feathery, but of the *seeds* or *receptacle* we can see nothing.

21. *A. hieracioides*. Corymbose Hawk-bit. Willd. n. 17.—"Stem branched at the top, hairy. *Leaves* oblong-lanceolate, hairy, toothed. *Hairs* forked."—Native of Galatia. Willdenow, who had a dried specimen, describes this plant as resembling *Hieracium murorum*. The *stem* is erect. *Leaves* sessile, an inch and a half long. *Flower-stalks* scaly and hairy. *Down* sessile, feathery. *Receptacle* naked.

THRINIUM-GILD. See TRINIUM-Gild.

THRIO, *Θριον*, in *Antiquity*, a festival in honour of Apollo.

THRIPS, in *Natural History*, a name used among the ancients to express a sort of worm hatched from the egg of a beetle: which, while in the worm-state, eats its way into wood, and forms cells and cavities in it of various shapes, and in various directions, often resembling the figures of letters or other things. See ENXYLON.

The ancient Greeks are said to have used small pieces of the wood thus eroded in particular forms, as seals, before the engraving of these utensils was invented; and indeed they must very well have served this purpose, since it is scarcely possibly to conceive how one of these pieces of corroded wood should be counterfeited, or the impression imitated.

Lucian mentions his marking his olives with a signature of one of these pieces of wood greatly eroded, and uses the word *thrips*, not as the name of the animal, but of the piece of wood eroded by it. Theophrastus, Pliny, and Aristotle, also use the same expression; and we find that the word thrips was as frequently used to signify the pieces of wood eroded, as the animal which eroded them.

THRIPS, in the *Linnean System of Zoology*, is a genus of the order of Hemiptera, the characters of which are, that the rostrum is obsolete, being hidden within the mouth; the antennæ filiform, and as long as the thorax; the body slender, and of equal thickness; the abdomen reflexible, and often bent upwards; the four wings extended, incumbent, narrow,

THRIPS.

row, and crossing one another at some distance from their base. The thrips has six feet, and the tarsus of each foot has only two articulations. Gmelin enumerates the following eleven

Species.

PARADOXA. Brown, with abbreviated wings, and antennæ pectinate, fissile and filiform. Found in China, but Gmelin doubts whether it be of this genus.

PHYSAPUS. With glaucous elytra or shell-wings, and black body. Found frequently on flowers in Europe.

MINUTISSIMA. With glaucous elytra and body, and brown eyes. Found as the former.

JUNIPERINA. With snowy elytra and brown body. Found in the galls of the juniper.

ULMI. Black, with snowy ciliated wings, and acuminate anus. Found gregarious on the bark of the elm.

URTICÆ. Yellow, with whitish elytra. Found solitary on the leaves of the nettle, vine, and hazle.

FASCIATA. With elytra banded with white and black, and brown body. Found on flowers in Europe.

FUSCA. Blackish, with glaucous elytra. Found in Denmark: the female probably fasciated?

OBSCURA. Yellowish, with palish elytra, and eyes and wings of the abdomen black. Found in Denmark.

RUEA. Red. Found on the spikes of wheat; if it be not the larva of the minutissima.

VARIEGATA. Variegated. Found on flax.

The thrips is highly injurious and destructive to many sorts of fine fruited trees, but particularly so to those of the grape or vine kind. The best and most effectual means of preventing its mischievous effects, in such cases, is probably that of frequent good washing of the trees with common water, by the engine or otherwise. It has lately been advised that this should be done every evening, as, when performed in the heat of the sun, the vines are materially injured. Indeed all such trees should, it is supposed, be well washed every evening, until the berries begin to colour, whether infested with insects or not, but especially in the former state; after which it is to be wholly discontinued.

Where there is a neglect of washing the trees in this or some other way, the thrips, for the most part, makes its appearance. In such cases, these insects may without much difficulty be destroyed by the fumigation of tobacco and damp hay; the plants or trees being well washed after it by pure water.

The *white-bug* is another insect which is often very hurtful to peach-trees and vines in forcing-houses; and the cause of which is believed to be much owing to the trees not being daily properly washed in the above manner. Each of these sorts of trees stand in need of particular management in clearing them of this insect.

The *brown-bug* too occasionally makes its appearance on, and is hurtful to peach-trees in such situations, especially when they are shaded, or approach near the flues of the houses. Proper washing of the trees, in these cases, with lime-water, in the winter season; and syringing them with it as soon as the leaves have fallen off, are often very effectual in removing such insects.

The *green-fly* is also very destructive to peach-trees, especially when in the forcing state. These are the most effectually destroyed by means of well washing the trees daily in a regular manner, after the work of forcing is begun. It is the common practice of most gardeners to discontinue such washings as soon as the flowers begin to make their appearance, but others have lately continued them with supposed

advantage, and not found them to prevent the fruit from setting. If any flies of this sort present themselves, they may be kept under by proper watering or washing, as above, and by carefully picking off the first buds on which they appear, which is found to prevent them from breeding, and to render the use of tobacco-smoke unnecessary. Fumigations of this substance are, however, sometimes beneficial in these cases in removing the vermin.

This and the *blue-fly* too are often very injurious to plum-trees, especially after they have been affected with the honey-dew. The manner of getting rid of them in such cases, which has lately been recommended, is that of watering the trees in a plentiful manner two or three times a week, if the weather be dry; and during the continuance of the above sort of dew upon the trees, preparing the water with a little common salt and the fluid part of a good portion of broom that has been boiled. This mixture, it is said, effectually kills the flies, while it does no injury to the trees, if care has been taken not to use too large a proportion of salt. This practice also tends to make the trees shoot stronger, and to hinder such insects from breeding.

There is another insect which has lately been found to be greatly injurious to apple and other fruit trees, but which is yet only little known to gardeners. It is the *Tortrix wæberana*, which may be seen well described in the second volume of the "Transactions of the Horticultural Society of London." It is there stated to be occasionally very hurtful to such trees, not only in the larva state, but others; and that its attacks are by no means confined to the diseased parts of such trees. The insect in its perfect state is a small moth, which is very abundant in gardens and fruit grounds.

In what regards the means of removing and destroying such insects when their attacks become injurious, the hints given below are thrown out. The first and most essential process evidently is, it is thought, to cut away the edges of the canker parts where they are chiefly found, making the wound smooth, and covering it with any composition likely to prevent the moth from depositing her *ova* or eggs there again. One precaution is necessary, which is to put into boiling water, or to bury at a considerable depth, the cut-out pieces of decayed bark containing the larvæ; which, if left near the tree, would soon crawl from their holes or other places, and remount it; thus defeating the labour of the horticulturalist, who often, from neglecting a slight additional trouble, loses the benefit of more painful exertions. Where the larvæ are found to have insinuated themselves generally into the rough bark of old trees, it would probably, it is thought, be advisable to scrape off the whole of the lifeless bark, and such portions of the alburnum as are injured, as suggested by Mr. Knight on another occasion; a process which, there can be no doubt, it is said, would be advantageous to the tree in other respects, as pointed out by the above writer. And where projecting saw-dust-like masses shew that the larva has attacked even smooth-barked trees, the insertion of a blunt pricker into the hole would probably, in most cases, suffice to destroy it, and do less injury to the tree than suffering it to attain its growth. But the mode which is most to be recommended in this, as in the case of almost all insects hurtful to fruit or other trees, is, it is said, to destroy the moths themselves by collecting them from off the trees, or other places, during the summer months, which might be done by children properly directed and provided with suitable means for the purpose, or in other ways. The destruction of every female moth, before the deposition of its eggs, may, it is said, be fairly calculated to prevent the

existence of some hundreds of larvæ; and thus, in any garden or fruit-ground not in the neighbourhood of others, where the same methods are neglected, the whole race might, it is supposed, be extirpated in a few years.

THRISSA, in *Ichthyology*, the name given by the Greeks and by the modern Latin writers to the fish which we call the shad, or the mother of the herrings.

THRIVING, in *Neat Cattle*, a term made use of by graziers and other stock-farmers to signify the property they have of doing well on the food they consume, or of fattening kindly, in contradistinction to that of a stunted unthrifty growth, or bad sort of feeding. It is mostly known by the hides or coats of the beasts having a mellowness of feel in handling them, with a fineness and sleekness in their appearance. This depends, in a very great degree, upon the pile and growth of the coats, for the shorter and sleeker they are, the more thriving the beasts; as, on the contrary, in proportion to length and hardness, is the unthriftiness of the stock.

A coarse, rough, thick hide is an indication too of hardness of flesh in beasts; while, on the contrary, fineness and closeness of grain in it, give the feel of fine texture in the hide.

These circumstances demand great attention in choosing neat cattle for all purposes.

THRIVING Drinks, such drinks as are prepared and given to neat cattle, or other beasts, when in a low unthrifty state. They are mostly composed of the powders of different sorts of aromatic seeds, such as those of aniseeds, carraway seeds, and grains of paradise, in the proportion of about two ounces of each: which are mixed well together and put into a quart of warm ale, in which they are given to the beasts; or of sweet fennel seeds and cummin seeds, each two ounces, long pepper, ginger, turmeric, and elecampane, each one ounce, mixed together, to be given in the same way as above, to which sometimes a little fresh butter and treacle or coarse sugar are added. Snake-root and gentian root, in powder, too, are sometimes employed in such drinks.

As the principal effect of such drinks, for the most part, depends upon the essential oil the substances may contain, they will be somewhat preserved and increased by giving them in the above manner.

The most proper management for the beasts in these cases, is to change their food as much as possible for the better, letting them have occasional good mashes of scalded bran, ground malt, or other such substances, with a small proportion of ground oats or barley meal put into them: warm water may also sometimes be necessary.

By the use of drinks of this sort, very reduced cows and other neat cattle may often be readily restored and brought into a thriving condition.

TRIXSPERMUM, in *Botany*, so called by Loureiro, from τριξ, a hair, and σπέρμα, seed. We cannot say much for the construction of this word, which should have been *Trichospermum*, provided there be no dormant claim to that name; but it is not worth changing, till we are better assured of the genus.—Loureir. Cochinch. 519.—Class and order, *Monandria Monogynia*. Nat. Ord. *Orchideæ*?

Gen. Ch. *Common Calyx* catkin-like, linear, compressed, fleshy, with alternate, acute, single-flowered scales. Perianth none. *Cor.* Petals five, linear-awlshaped, long, erect, nearly equal. Nectary attached to the receptacle, between the two lowermost petals, deeply divided into two lips; the inner one three-cleft, embraced by the petals, its lateral segments short and blunt, the middle segment longest, conical, ascending; outer one ovate, undivided, prominent

beyond the petals. *Stam.* Filament solitary, thread-shaped, short, attached to the pistil; anther ovate, of two cells, with a lid. *Pist.* Germen thread-shaped, straight, bearing the flower; style thick, unequal, standing on the base of the nectary; stigma simple. *Peric.* Capsule oblong, triangular, the angles acutely emarginate, of three valves and one cell. *Seeds* numerous, long, very slender, like hairs.

Ess. Ch. Petals five, linear, erect. Outer lip of the nectary ovate, prominent.

1. *Th. centipeda*. Nhánh gỏi rít of the Cochinchinese. Found in Cochinchina, creeping upon the native trees. The stem is parasitical, long, compressed, perennial, creeping by means of simple, very short, lateral roots. *Leaves* linear-lanceolate, entire, small, sheathing, reflexed. *Flowers* pale yellow, with a reddish nectary, in straight, lateral, catkin-like, two-ranked spikes.

We guess this to be allied to some of those parasitical *Orchideæ*, formerly referred to *Epidendrum* by Linnæus; and by Swartz chiefly to *Cymbidium*. The structure of the whole tribe is so obscure, that Loureiro may very well be excused if we cannot entirely unravel his description.

THTOANA, in *Ancient Geography*, a town of India, on the other side of the Ganges, which Ptolemy assigns to the people called Lesti, or pirates.—Also, a town of Serica, near the mountains in the vicinity of Asmiræa. Ptolemy.

THROAT, the anterior part of an animal, between the head and the shoulders, in which is the gullet.

Physicians include, under the word throat, all that hollow, or cavity, which may be seen when the mouth is wide open.

It is sometimes also called *isthmus*, because it is narrow, and bears some resemblance to what is called by geographers *isthmus*.

THROAT, Sore, in *Medicine*. See **QUINZY**.

THROAT, Wounds of, in *Surgery*. See **WOUNDS**.

THROAT, in *Architecture, Fortification, &c.* See **GORGE** and **GULA**.

THROAT, in *Ship-Building*, the inside of knee-timber at the middle or turn of the arms. Also, the middle part of the floor-timbers; the inner part of the arms of an anchor, where they join the shank; and the inner ends of booms and gaffs, where they traverse round the mast.

The throat is opposed to peek, which implies the outer extremity of the said gaff, or that part which extends the sail behind. Hence the ropes employed to hoist up and lower a gaff, being applied to those parts of it, are called the throat and peek haliards. Falconer.

THROAT-Wort, in *Botany*, the name of a perennial weed common in pasture grounds. The stalk is cornered and undivided. The flowers grow in bunches at the top of the stalk. They are erect, of a beautiful purple colour, and divided in the middle into five acute segments. It is a very pernicious weed when suffered to get a-head in such lands, and not capable of being destroyed without considerable difficulty and trouble. See **TRACHELIUM**.

This plant yields, when wounded, a milky juice in great plenty, and this, if received into a shell or other small vessel, curdles immediately, and the whey runs from the thick part: this whey is of a brown colour, whereas that of the wild lettuce is of a fine purple, and dries into a cake that may be crumbled into a purple powder. The juice of the throat-wort smells sour, and its curdled part, being dried, burns like resin at the flame of a candle. Phil. Transf. N^o 224.

THROATING, in *Agriculture*, the act of mowing beans against their bending, which is never done but in a thin crop. But in such it is often necessary, in order to cut them with the most perfection and advantage. They should

should never be allowed to become too ripe when intended to be cut in this manner. The term is also occasionally applied to some other purposes in husbandry.

THROGGY, in *Geography*, a river of Monmouthshire, which runs into the Severn, 4 miles S.W. of Chepstow.

THROMBUS, from *θρομβος*, *coagulated blood*, a clot of blood. The term has also been applied to a tumour, formed of a collection of extravasated blood under the integuments after bleeding. When such an extravasation, though of some extent, is not considerable, it is usually called an *ecchymosis*; which see.

A thrombus sometimes depends on the surgeon having totally divided the vein; but much more frequently on his not having made the opening in the vessel properly correspond to that in the skin. The patient's altering the posture of his arm, while the blood is flowing into the basin, will often cause an interruption to the escape of the fluid from the external orifice of the puncture; and, consequently, it insinuates itself into the cellular substance in the vicinity of the opening in the vein. In proportion as the blood issues from the vessel, it becomes effused between the skin and fascia in the interstices of the cellular substance, and this, with more or less rapidity, and in a greater or lesser quantity, according as the edges of the skin impede more or less the outward escape of the fluid. Sometimes, also, a thrombus forms after venesection, when the usual dressings, compresses, and bandage, have been put over the puncture, and the patient imprudently makes use of the arm on which the operation has been done. This is more particularly liable to happen when a very large opening has been made in the vein.

The accident is not attended with any danger when the extravasation is inconsiderable; for, in this circumstance, the tumour generally admits of being easily resolved by applying to it linen dipped in any discutient lotion. If the swelling should be more extensive, applying to it a compress wet with a solution of common sea-salt, is deemed a very efficacious plan of promoting the absorption of the extravasated blood. Brandy, and a solution of the muriate of ammonia in vinegar, are likewise eligible applications.

It sometimes happens, that a thrombus induces inflammation and suppuration of the edges of the puncture. The treatment is now like that of any little abscess: a common linseed poultice may be applied, and any considerable accumulation of matter should be prevented, by making an opening with a lancet in proper time. As soon as the inflammatory symptoms have ceased, discutients should be resorted to again, for the purpose of dispersing the remaining clots of blood and surrounding induration. Cooper's Dict. of Practical Surgery.

THRONE, *θρονος*, a royal seat, or chair of state, enriched with ornaments of architecture and sculpture, made of some precious matter, raised one or more steps, and covered with a kind of canopy.

Such are the thrones in the rooms of audience of kings, and other sovereigns.

THRONI, in *Ancient Geography*, a town of the isle of Cyprus, upon the southern coast, S.W. of Leucolla, and at some distance N.W. of the promontory of Pedalium. Near this town was a promontory of the same name, according to Ptolemy.

THRONION, or **THRONIUM**, a town belonging to the Locrians, situated, according to Strabo, 20 stadia from the sea.

THRONIUM, a town of the Abantide, which was a district of Thesprotia, in Epirus, towards the Ceraunian mountains. On the return from the war of Troy, when the ships of the Greeks were dispersed, the Locrians of

Thronium, and the Abantes of Eubœa, were driven with eight vessels towards the Ceraunian mountains. They established themselves in this place, and built a town, which they called Thronium, and they gave the country the name of the Abantide. They were afterwards expelled by the Apolloniatæ.

THROO, or **THROUGH**, in *Agriculture, a term signifying a breadth, slip, or width of corn, which a set of reapers, &c. drive before them at once, whether it consist of one or more lands or ridges. The mode of reaping by means of throos is very common in some of the northern counties of the kingdom, and supposed by some to greatly expedite the work.*

THROPPLE, among country people, denotes the wind-pipe of a horse.

THROSTLE, or *Song-Thrush*, *Maxis*, or *Turdus muscivorus* of Linnæus, in *Ornithology*, is called by authors the *turdus muscivorus minor*, to distinguish it from the larger species, called in English the *missel-bird*, and usually known among us by the simple name of *thrush*. It is called *muscivorus* by authors, from its resemblance in colour to the other *muscivorus*, not from its feeding on the misletoe-berries, as that does.

It resembles the misle-thrush in colour, except that the inner coverts of the wings are yellow.

It feeds on worms, snails, and small insects, and remains with us the whole year. It builds with moss and stubble, and lines the nest with mud. On this it lays five or six eggs, which are of a blueish-green, variegated with a few black spots. It sits on hedges and bushes, and sings very agreeably.

The throistle is the finest of our singing-birds, not only for the sweetness and variety of its notes, but for the long continuance of its harmony; as it obliges us with its song for nearly three parts of the year. See **TURDUS**.

THROSTLING, a disease of black cattle, proceeding from humours gathering under their throats; by which means their throats are so dangerously swelled, that they will be choaked, unless seasonably relieved by bleeding.

THROUGH-STONE, in *Rural Economy*, a term which signifies a long stone which passes the whole breadth of the wall in making fences of that kind, and which binds them together in a more perfect manner than would otherwise have been the case. It is always of great importance to have plenty of throughs in fences of this nature, from almost the bottom part to near the top.

THROW, the provincial name of a turner's lathe. There is a great variety of these sorts of tools in use for different purposes. See **LATHE**.

THROW the Glove. See **GLOVE**.

THROWED SILK. See **SILK**.

THROWSTER, one who prepares raw silk for the weaver, by cleansing and twisting it. See **MILLING** and **SILK**.

THRUM, in *Gardening*, among the cultivators of fine flowers, is a term applied to the thread-like internal bushy parts of them, and which, in some sorts of good flowers, such, for instance, as the auricula and other similar kinds, should be of a bright colour, and the chives, or thready bristles, of which it is composed, clear and shining with spangles, somewhat like gold-dust; and they should also be distinct from each other, leaning inwardly towards the pipe; as when they appear clotted together, or look battered or mis-shapen, the beauty of the flowers to which they belong is much impaired; which is not unfrequently occasioned by the wild and other bees, which, when in search of honey or food, are apt to greatly hurt such parts of fine flowers.

flowers. The bees, in such cases, should be carefully taken by proper means, and be prevented as much as possible from collecting their food from such fine kinds of flowers.

THRUM-Cap Island, in *Geography*, a low woody island, of a circular form, and not much more than a mile in compass, in the South Pacific ocean, covered with verdure of many hues, but without inhabitants, discovered and so called by Cook in April 1769. S. lat. $18^{\circ} 35'$. W. long. $139^{\circ} 48'$.

THRUM-Wort, in *Agriculture*, a troublesome weed in some lands of the rather moist down kind, which is of the perennial sort.

THRUMMING, in *Rigging*, denotes interplacing short pieces of thrums, or rope-yarn, in a regular manner into matting, through intervals made by a fid, or large needle.

THRUSH, an affection of the inflammatory and suppurating kind in the feet of the horse, and some other animals. In the horse it is an inflammation taking place in that part of the foot termed the sensible frog, which is mostly occasioned from want of due cleanliness in it, especially in those of the team or working sort, from the heels being in a contracted state, or from shoeing upon erroneous and bad principles, but most commonly from the last of these causes. See **SHOEING**.

The disease may be known to be present in this, as well as in other animals, by a tenderness and uneasy feel being shewn on pressing the frog, or affected part, and its being accompanied with a discharge of matter of the purulent kind, as well as by other similar appearances.

The means of removing the complaint in the horse, when inflammation is chiefly present, consist first in taking away the shoe, and lowering the heels, in such a manner as that the frog or diseased part may come in contact with the ground or floor: after which the animal may be suffered to stand some days without shoes, the part being well washed two or three times a day with a common stable brush, and a solution of soft soap in rain-water, an application composed of white vitriol, Armenian bole, and alum, in fine powder, of each half an ounce, mixed up with common tar, in a sufficient proportion to make a sort of ointment, being then had recourse to as a dressing. This may be used spread upon lint, being applied between the cleft of the frog, or affected part, and renewed as often as there may be a necessity.

It is likewise advised by some, that all the diseased parts, in such cases, should be carefully removed by means of a drawing-knife, and that if the animal be not allowed to have rest, a bar-shoe must be had recourse to, until the disease becomes quite removed. It is thought, too, that three or four pints of blood may often be taken away with advantage in cases where there is much inflammation, and masses with nitre be given in the evenings. Much benefit also may sometimes be found from the use of diuretic balls, and from the foot affected being fomented with warm water, in which a handful of common salt has been dissolved, just before the application of the above dressing. Great utility is occasionally derived, too, from the insertion of a seton or rowel in the chest, or other proper part, and letting it continue some time. See **SHOE**.

In cases where the complaint proceeds chiefly from contracted heels, some suppose the only certain and effectual mode of removing the affection is, perhaps, that of the use of the artificial, or patent frog, not long ago invented by Mr. Coleman, who has bestowed much attention on the feet of animals, especially of the horse. See **FROG**.

In other animals, where the hoofs, claws, or other parts of the feet are affected with inflammation, and collections

or discharges of matter, in some measure of the thrush kind, or having some resemblance to it, the best means of relief are probably those of first trying the effects of discutient saturnine applications, and if these do not succeed, to have recourse to warm emollient fomentations or poultices, then cutting or paring the parts down so as to lay them well open, and let out any thing they may contain, dressing the openings with mild escharotics, as there may be occasion. In this way, very troublesome affections of this sort may often be speedily removed.

THRUSH, in *Medicine*. See **APHTHE** and **INFANT**.

THRUSH, in *Ornithology*, is the *turdus viscivorus* of Linnæus, and the largest of the genus. See **TURDUS** and **MISSEL-BIRD**.

THRUSH, *Wind*. See **RED-WING**.

THRUSHEL, in *Geography*, a river of England, in the county of Devon, which runs into the Tamer, opposite to Launceston.

THRUSK. See **THIRSK**.

THRUST, in *Fencing*, is an action of which there are three kinds. *To thrust in carte*, is to throw your hand as far as possible on the inside, with the point of your sword towards your adversary's breast: *to thrust seconde*, is to have your arm in a perfect opposition to your adversary's, holding your head inside: *to thrust tierce*, differs from carte only by the position of the hand, which must be reversed.

THRUSTING, or *Hand-pressing*, in *Dairying*, is a term applied to the practice of squeezing and forcing the liquid parts contained in the curd out of it by the hand, or other such means, after it has been properly reduced, and placed by a cloth in an upheaped or conical manner in the vat or hoop.

THRUSTING-Screw, in *Rural Economy*, a contrivance of the large screw kind, calculated for affording due pressure in the making of cheese with facility and convenience. These screws are perfectly simple, and capable of being made either of wood or iron; but the latter material is probably by much the best. They may be wrought in several different ways, but it is commonly done by means of a sort of lever applied in some manner or other, not unfrequently through a hole for the purpose in the head of the large screw. In some districts they have them fixed up to the under-sides of the floors above the pressing-rooms, and the power of them so managed as to be regulated at pleasure. By means of these thrusting-screws, it is evident that the pressure can be gradually increased, as there may be occasion, from the first application to the concluding hard or heavy pressure in finishing the work. This command of power is, of course, a circumstance of great utility and advantage in such business.

THRUSTINGS, a term applied in cheese-making, in some districts, to the *white whey*, or that which is the last pressed or forced out of the curd by the hand and other means, after it has been put into the cheese vat. In some instances in the process and practice of making butter of the whey kind, these thrustings are set by in earthen pans for the purpose, in order to acidulate, or *carve*, as it is called in some places, either by means of the warmth of the season, or of a room, for being churned, in the same way as in the common manner practised, in many places, for making butter from milk. See **WHEY**.

These thrustings, probably, form and constitute the best butter of the whey sort, though it is made from that fluid managed in other ways, as seen under the head just referred to above.

THRYALLIS, in *Botany*, an ancient Greek name for something of the Mullein kind, whose woolly leaves served

to make wicks for lamps. It is not easy to conceive how Linnæus came to apply this name here, nor can we trace out any thing to account for his having done so. We most readily agree with De Theis, that the shrub about to be described has nothing in common with *Verbascum* but its yellow flowers. (See Dioscorides, book 4. chap. 104.)—Linn. Gen. 213. Schreb. 289. Willd. Sp. Pl. v. 2. 570. Mart. Mill. Dict. v. 4. Juss. 251.—Clafs and order, *Decandria Monogynia*. Nat. Ord. *Tricocceæ*, Linn., *Acera*, Juss.

Gen. Ch. *Cal.* Perianth inferior, in five deep, lanceolate, erect, permanent segments. *Cor.* Petals five, roundish, spreading. *Stam.* Filaments ten, awl-shaped, longer than the calyx; anthers roundish. *Pist.* Germen obtuse; style thread-shaped, the length of the stamens; stigma simple. *Peric.* Capsule with three sides, and three angles, obtuse, separable into three parts; its cells bursting at the external angle. *Seeds* solitary, very smooth, obovate; obtuse at the base, with an incurved point.

1. *Th. brasiliensis*. Brasilian Thryallis. Linn. Sp. Pl. 554. Willd. n. 1. (*Frutescens herba*; Marcgr. Bras. 79. f. 3.)—Native of Brasil. A little shrub, with round, jointed, reddish branches. *Leaves* on reddish footstalks, opposite, ovate, entire, about an inch long; pale green above; whitish beneath, with a slender mid-rib. *Stipulas* bristle-shaped. *Clusters* terminal, solitary, from six or seven inches to a foot long, with very slender partial stalks, longer than the flowers, and very short setaceous bractæ. *Flowers* small, elegant, yellow, bordered with red, with which colour also their yellow stamens are speckled. *Fruit* three-lobed. Neither the plant nor its flower has any remarkable odour.—Linnæus appears to have examined a dry specimen of this plant, but it is wanting in his herbarium, as well as in every other that we have seen. His idea of its natural order is surely less correct than Jussieu's. Specimens without fruit are not unlikely to have been overlooked for some nondescript *Banisteria* or *Malpighia*.

THRYANDA, in *Ancient Geography*, a town of Asia Minor, in Lycia. Steph. Byz.

THRYOCEPHALUM, in *Botany*, a genus of Forster's, named from *θρυον*, a sort of rush, and *κεφαλη*, a head, because of the habit of the plant, and its little round head of flowers. This genus is the same as KYLLINGIA. (See that article.) The only species mentioned by Forster, is there considered by us as *K. monocephala*. Vahl, in his *Enum. Plant.* v. 2. 381, refers it to *K. triceps*, probably because he saw a specimen with a compound head. This very circumstance strengthens his own suspicion, that these two supposed species of *Kyllingia* are not, in reality, distinct. Our specimen from Forster himself has a very slight indication of a small lateral head, by the side of the principal one, nor can it be otherwise distinguished from *K. monocephala*. In the structure or appearance of any other part, we cannot discern the least difference between *monocephala* and *triceps*, in separating which we confided more in those who have originally described these plants, than it seems they deserved.

THRYOESSA, or THRYON, in *Ancient Geography*, called from the time of Strabo Epitalium, situated on the left banks of the Alpheus, E. of Olympia.

THUAREA; in *Botany*, bears that name in honour of M. Aubert du Petit Thuars, a French botanist of the present day, who is cited for the genus itself in Perf. Syn. v. 1. 110.—Brown Prodr. Nov. Holl. v. 1. 197.—Clafs and order, *Triandria Digynia*. Nat. Ord. *Gramina*.

Ess. Ch. Calyx-glumes of one valve, two-flowered, spiked, unilateral, on a dilated common stalk; the lowermost ones only partly perfect; the rest male only; the inner floret of

the lowermost glume male, its outer valve resembling the calyx. Nectary of two scales at the base of the germen. Stigmas feathery. Seed wrapped in the corolla, and enclosed in the hardened, closed, involute stalk.

The stems are creeping, very long, with erect, short, undivided, leafy branches. Spike solitary, terminal, short, for a long time half enclosed in a leaf-like sheath. The common stalk is thick and coriaceous, not membranous, as M. du Petit Thuars terms it, he having, as Mr. Brown supposes, confounded that part with the sheath. Flowers sessile, in a simple row, one or two of the lowest only being perfect, the remaining four, five, or six, in the contracted portion of the spike, males.

Mr. Brown observes, that this genus of grasses is not very distantly related to PANICUM (see that article); especially to *P. dimidiatum*, Retz. Obs. fasc. 6. 23; but in *Thuarea*, the calyx-glumes are, with respect to the stalk, inverted, and want an outer valve. In structure this genus agrees, in many particulars, with SPINIFEX, (see that article,) in which the sexes are indeed more separated, and therefore a requisite abundance of males is provided. The figure and economy of the common-stalk, or rachis, too is different; though that part is permanent in both genera, and assists in both, though not in the same manner, to disseminate the seeds.

The only species of which we can give an account are the three following, though Mr. Brown mentions also a *T. sarmentosa*.

T. latifolia. Br. n. 1.—“Perfect flowers two. Stems downy. Leaves lanceolate, silky on both sides.”—Gathered by sir Joseph Banks, in the tropical part of New Holland.

T. media. Br. n. 2.—“Perfect flowers solitary. Leaves linear-lanceolate; their under side smooth, as well as the stem.”—Found by Mr. Brown, in the tropical part of New Holland.

T. involuta. (*Ischæmum involutum*; Forst. Prodr. 73. Willd. Sp. Pl. v. 4. 741.)—“Perfect flowers solitary. Leaves lanceolate, nearly smooth on both sides.—Gathered by Forster in the Society Isles, and some other places within the tropics. The specimen given by him to the younger Linnæus is marked *Tabitié*. The erect stems, or branches, are but two or three inches high, simple, striated, smooth, each bearing at the bottom one lanceolate, acute, striated leaf, about its own length; sheathing at the base; becoming involute in drying. Sometimes there is another leaf, about half as long, with a sheath almost an inch in length, near the middle of the branch. Spike scarcely an inch long, terminal, of about four flowers, springing laterally from the hollow of a concave pointed leaf, rather shorter than the rest. Calyx ribbed. Corolla smooth. Feathery stigmas very conspicuous in the lowermost flower.

THUBUNA, TUBNAB, in *Ancient Geography*, a town of Mauritania Sitifensis, according to Ptolemy; situated in the mountains, between two rivers, S.W. of Igilgili.

THUBURSICA, a town of Africa, in New Numidia. Ptol.

THUBUTIS, a town of Africa Propria, near Bullaria. Ptol.

THUCCA, or TUCCA, *Dugga*, a town of the interior of Africa, mentioned by Ptolemy; situated at the extremity of a small chain of hills about two miles S. of Tiburicum-bure. On this site were found many mausoleums, and the portico of a temple ornamented with beautiful columns. Here was also an aqueduct.

THUCYDIDES, in *Biography*, a celebrated Greek historian, was born in the 77th Olympiad, about 470 B.C. The

The name of his father was Olorus, or Orolus, that of a Thracian prince, indicating a connection with Thrace, in which he seems to have possessed gold-mines, and to have had influence over its chiefs. He belonged to one of the principal families at Athens, and was related to that of Miltiades. His education was that which distinguished Athenians of rank: Antiphon being his preceptor in rhetoric, and Anaxagoras in philosophy. When he heard Herodotus recite his history at the Olympic festival, he is said to have shed tears; and Herodotus observing it, congratulated Olorus on his son's disposition. At the commencement of the Peloponnesian war he was at Athens, and shared in the calamity of pestilence that then occurred; and in the eighth year of that war he had a command in Thrace, and was opposed to the Spartan general Brasidas, who surprised the town of Amphipolis, for the loss of which Thucydides was punished by banishment, though it does not appear that he could have prevented it. During the twenty years of his exile, he devoted himself to literary researches and observations through different parts of Greece, and thus collected materials for the history which he was projecting. He resided for a considerable time in Thrace, but the place and time of his death are not ascertained. Dodwell conjectures that he passed his 80th year, and died in Thrace. His history comprehends the transactions of the first twenty years of the Peloponnesian war, disposed in eight books; more limited in its compass than that of Herodotus, but not merely rivaling but surpassing it in historical merit, more especially if we admit what a modern writer says of it, "that the first page of Thucydides is the commencement of real history." The distinguishing characteristics of this historian are diligence of research, and the selection of the best authorities, and perfect impartiality. To these qualities we may add sagacity in investigating causes and effects, and a philosophical spirit in forming a discriminating judgment of human affairs. His narration is occasionally very interesting, and indicates the writer of genius. His style, which has undergone much criticism, is of that kind which the ancients termed the austere, aiming at force and brevity rather than harmony, elegance, or perspicuity. Its conciseness and frequent transpositions render it frequently obscure, nor is this defect compensated by its energy and elevation. The most valued editions of this work are Hudson's, Oxon. 1696; Wasse and Ducker's, Amst. fol. 1731; and the Leipzig, 2 vols. 4to. 1790—1804. Voff. Hist. Græc. Gen. Biog.

THUDACA, in *Ancient Geography*, a town of Africa, in Mauritania Cæsariana, near Tingis. Ptol.

THUELATH, a maritime town of Africa, on the coast of Libya, between Autolatæ and Thagana. Ptol.

THUEYE, in *Geography*, a town of France, in the department of the Ardeche; 18 miles W. of Privas.

THUJA, in *Botany*, *θύια*, *θυια*, or *θυια* of the Greeks, the name of a tree, whose very durable wood served, according to Theophrastus, to make images. Its root in particular, being curiously twined or veined, was used for the most valuable ornamental works. This plant was probably the *Juniperus Oxycedrus*, very common throughout Greece and the Archipelago, of which Mr. Hawkins is of opinion that the most ancient statues were made. It is the Small Cedar, *κεδρος μικρα* of Dioscorides, and still universally bears the name of *κεδρος* in modern Greek. Our present genus of *Thuja* has nothing in common with this classical plant, except being an aromatic evergreen tree, of the same natural order, with a very durable wood; but it is not a native of Greece or the Levant.—Linn. Gen. 500. Schreb. 651. Willd. Sp. Pl. v. 4. 508. Mart. Mill. Dict. v. 4. Ait. Hort. Kew. v. 5. 321. Pursh 646. Juss. 413. Tourn. t. 358. Lamarck

Illustr. t. 787. Gært. t. 91.—Class and order, *Monocotyledonae*. Nat. Ord. *Coniferae*, Linn. Juss.

Gen. Ch. Male, *Cal.* Catkin ovate, composed of a common stalk, on which the flowers stand opposite, in three rows, each flower having for its base a nearly ovate, concave, obtuse scale. *Cor.* none. *Stam.* Filaments in each flower four, but scarcely visible; anthers as many, attached to the base of the scale above mentioned.

Female on the same plant, *Cal.* Catkin nearly ovate, with opposite flowers, and consisting of two-flowered, ovate, convex scales, converging longitudinally. *Cor.* none. *Pist.* Germen minute; style awl-shaped; stigma simple. *Peric.* Cone ovate-oblong, obtuse, burting lengthwise, into oblong imbricated, nearly equal, obtuse, externally convex scales. *Seeds* solitary, oblong, each surrounded by a longitudinal membranous emarginate wing.

Ess. Ch. Male, Catkin with imbricated scales. Corolla none. Anthers four.

Female, Catkin becoming an imbricated cone, with two-flowered scales. Corolla none. Seed surrounded by a vertical membranous wing.

Obs. Linnæus indicates the close relationship of this genus to *Cupressus*. They are nevertheless distinguished by the peltate scales of the cone in the latter, and its angular, obtuse, scarcely winged, seeds, or nuts.

1. *Th. occidentalis*. American Arbor-vitæ. Linn. Sp. Pl. 1421. Willd. n. 1. Ait. n. 1. Pursh n. 1. "Michaux Arb. For. v. 3. 29. t. 3." (Arbor vitæ; Clus. Hist. v. 1. 36. Ger. Em. 1369.)—Young branches two-edged. Leaves imbricated in four rows, compressed, ovate, somewhat rhomboid, dotted. Inner scales of the cone abrupt, tumid under the point.—Native of North America, from Canada to the mountains of Virginia and Carolina, blossoming in May. It is rather scarce in the southern states, and only found on the steep banks of mountain torrents. The branches are extremely tough. *Pursh*. This tree was introduced into our gardens in Gerarde's time, or before, and is much esteemed for ornament and shelter in shrubberies, or for platted and clipped hedges in nursery-gardens, in which last state it is really very beautiful. By a strange mistake of Linnæus, this species is handed down as a native of Siberia; because Gmelin, *Fl. Sib.* v. 1. 182, mentions a *Thuja*, to which he misapplies the synonyms of the present, but which by his own account is different; for he says it is "paler than the garden kind, and smaller in all its parts." It was brought him by a travelling surgeon, from rocks near Pekin in China, and could be no other than the *Th. orientalis*, hereafter described. *Th. occidentalis* is a perfectly evergreen tree, of humble growth, much branched, very different from most others in the compressed vertical aspect of its younger shoots, and their closely imbricated leaves, which are small, obtuse with a point, smooth; those of two opposite rows compressed and keeled; the intermediate ones flat, with a glandular point, or cell of resin, at the back. The flowers appear in May, and are small, solitary, terminal; the males yellowish, and most abundant. Cones ripened the following year, drooping, each the size of a silberd-kernel, consisting of about half a dozen lax, smooth, coriaceous scales. The smell of the bruised plant is something like Savine, aromatic, but not agreeable. The wood is not hard, but tough and extremely durable, on which last account it is much esteemed in America for making pales and fences.

2. *Th. orientalis*. Chinese Arbor-vitæ. Linn. Sp. Pl. 1422. Willd. n. 2. Ait. n. 2. Gært. f. 1. "Schkuler Handb. v. 3. 285. t. 309. (Thuya; Gmel. Sib. v. 1. 182. Th. n. 3; Duhamel Arb. v. 2. 320. t. 90, the two lower figures.

THUJA.

figures. Very bad.)—Young branches two-edged. Leaves imbricated in four rows, compressed, ovate, somewhat rhomboid, with a central furrow. Inner scales of the cone obtuse, with a recurved dorsal point.—Native of rocky situations in China. *Gmelin*. On mountains in Japan. *Thunb. Jap.* 266. A hardy tree in our gardens, which appears to have been cultivated by Miller in 1752. It flowers at the same time as the former, but though a much more handsome tree, is less common. The very copious and crowded young branches are more erect, more slender, and rather less compressed than the former, and the leaves are furrowed, without any resinous dot. The differences between these two species are accurately marked in our specific characters, adopted from Linnæus and Willdenow. The inner scales of the cone in that before us are remarkably hooked. Gærtner observes that the wing of its seed is hardly discernible.

3. *Th. articulata*. Jointed Arbor-vitæ. *Vahl. Symb.* v. 2. 96. t. 48. *Desfont. Atlant.* v. 2. 353. t. 252. *Willd. n. 3.* (*Th. aphylla*; *Linn. Sp. Pl.* 1422, as to the synonym of Shaw, and part of the character taken from thence, but not of *Am. Acad.* v. 4. 295; see TAMARIX. *Cypressus fructu quadrivalvi, foliis equiseti instar articulatis*; *Shaw Afric.* n. 188. f. 188.)—Young branches jointed, rather compressed, with four furrows. Leaves minute, concave, pointed, four at the top of each joint; glandular at the back. Cones quadrangular, of four hooked scales.—Native of the mountains of Barbary, where it is not uncommon. A tree from fifteen to thirty feet high, with round branches, the younger ones repeatedly subdivided, in a partly opposite, partly alternate manner, moderately compressed, composed of a series of linear, smooth, brittle joints, from a quarter to half an inch long, and marked with four longitudinal furrows, which are continued to the interstices of the four minute scale-like leaves crowning each of these joints. Willdenow, misled by the analogy of other species, and the figures of authors, supposes each joint to be an assemblage of leaves, from which error the faithful descriptions of Vahl and Desfontaines might have guarded him. *Catkins* terminal, solitary; the males ovate-oblong, of many scales; females roundish, of much fewer. *Fruit* somewhat depressed, about the size of a black currant, with four protuberant angles, and crowned with as many intermediate reflexed points. The scales separate at the angles, but are firmly united at their base. *Seeds* small, with a broad kidney-shaped wing. The late celebrated Broussonet observed the resin called Gum Sandarache to be procured from this tree. Dale attributes it to the Common Juniper. Such being the history of the species before us, the *Th. aphylla* of Linnæus becomes a non-entity.

4. *Th. dolabraia*. Sculptured Arbor-vitæ. *Linn. Suppl.* 420. *Willd. n. 4.* *Thunb. Jap.* 266. (*Quai, vulgò Fi no ki et Ibuki*; *Kämpf. Am.* 884.)—Young branches two-edged, jointed; convex on one side; concave and white on the other; joints obovate. Leaves lateral, opposite, keeled, compressed.—Native of Japan. Thunberg observed it in the countries of Oygawa and Fakonia, between Miaco and Jedo; and it was planted along the high road on the hill of Fakonia. He speaks of it as a tree of vast height and dimensions, the most beautiful of all the evergreen tribe. The branches are alternate, repeatedly subdivided, compressed and clothed with imbricated leaves. At first sight the young branches appear covered with four rows of leaves, but the analogy of the foregoing species, even of the first of all, leads us to believe the intermediate row, on each side, is an obovate furrowed joint, insensibly terminating in a short broad leaf, while the more obvious leaves are opposite, laterally inserted into the base of the joint at each side, and about the same

length; each of them strongly compressed, with a thick keel, and incurved point. Their great peculiarity consists in being all convex and green on the upper side of the branch; concave and as if whitewashed, like the furrows of the joints, on the under. This gives the plant an artificial, but most elegant, appearance. The flowers we have not seen. Kämpfer says the fruit is warty, the size of a pea.

5. *Th. cupressoides*. African Arbor-vitæ. *Linn. Mant.* 125. *Willd. n. 5.* *Ait. n. 3.* *Thunb. Prodr.* 110. (*Th. aphylla*; *Burm. Prodr.* 27, excluding the reference to Shaw.)—Young branches but slightly compressed. Leaves imbricated in four rows, even. Cones nearly globose, of four acute warty scales.—Native of the Cape of Good Hope, from whence Dr. Roxburgh introduced it to Kew Garden in 1799. The growth of the tree is tall and close, like that of the Cypress. Leaves closely imbricated, not spreading. *Fruit* of the size and appearance of the Cypress, nearly globular, with four obsolete angles, separating into four thick acute valves or scales, tuberculated externally, keeled within. *Seeds* numerous, each terminated by a membranous obovate wing. Linnæus adds to this description, "*Ramuli minime articulati more Equiseti.*" If *minime* be not printed by mistake for *minimi*, we presume this alludes to Shaw's synonym, cited in the *Mantissa* with many scruples, and certainly not belonging to this but to *articulata*, our third species.

THUJA, in Gardening, contains plants of the hardy, evergreen tree-kind, of which the species cultivated are, the American arbor-vitæ (*T. occidentalis*); and the Chinese arbor-vitæ (*T. orientalis*).

In the first of these species there are different varieties; as the American sweet-scented, and the variegated-leaved.

Method of Culture.—These plants may be increased by seeds, layers, and cuttings. Good seeds should be obtained from the native situations of the trees, and be sown soon after they are ripe, or as soon as they can be obtained, in autumn or spring, in pots or boxes of light earth, covering them half an inch deep, placing the pots, &c. in a sheltered warm situation, or under the shelter of a frame in bad weather, especially when sown in autumn, that they may be protected from severe frosts: they sometimes come up in the spring, but are frequently apt to remain in the ground till the second year. When the plants are come up, the pots should be placed in an east border to have only the morning sun, but open to the free air, giving frequent but very moderate waterings all the summer; and in winter removing the pots again to a sheltered place till spring, when they may be pricked out in nursery-rows; or, when they are small and weakly, continued in the pots another year, placing them in a shady situation during summer, and in a sheltered place in winter; and in the spring following planting them out in the nursery, in rows a foot or two asunder, in order to acquire size and strength for planting out where they are to remain.

The layers should be made from the young shoots of one or two years growth, which may be laid down early in autumn, bending down the branches to the earth, and laying all the young wood in by slit or twist-laying, with the tops only appearing a little above ground; shortening any that have much longer tops than the others: they mostly emit roots in the earth, and form proper plants by the autumn following; when, or rather in spring after, they should be separated from the stools, and be planted in nursery-rows, to remain two or three years, or till of a proper size for the shrubbery, &c.

The cuttings should be made from the strong young shoots of the same year's growth, which should be planted

in the autumn in a shady border, taking the opportunity of showery weather, if possible, for the business; they should be cut off with a small part of the old wood, where practicable, and be planted in rows a foot asunder, closing the earth well about them: they will be properly rooted in one year for planting out in wider nursery-rows: they may also be planted in pots, and placed in a hot-bed, in order to have them more forward.

And they all may be planted out into the borders, &c. in the autumn or early spring months.

These trees in their native situations grow to very considerable sizes and magnitudes, but in this climate they are of much inferior growths, seldom rising to any great height or thickness. They succeed best in the countries from which they are brought, in rather moist soils; but here they thrive perfectly in any tolerably good common kind, and in any situation. They have a beautiful form of growth, being much and finely branched from their very bottoms, and constantly closely adorned with leaves, which are of a very minute size, and arranged in a curiously compact imbricated manner, displaying a continual verdure and ornamental variety at all times of the year.

They are highly ornamental evergreens, proper for adorning the shrubbery and other parts, having a fine effect also when disposed singly in borders, &c. and in open spaces of grass; in all of which situations they should be suffered to grow with their full branches, in their own natural way, except reducing with a knife any low straggling or rambling branches occasionally: this is all the culture they require afterwards.

They may also be employed as timber-trees, in the evergreen forest-tree plantations.

And those in the pots, as the Chinese arbor-vitæ, may be placed among other potted plants to adorn any particular compartment, and in assemblage with greenhouse plants for variety.

THUILLIER, VINCENT, in *Biography*, a learned Benedictine, was born at Coucy, in the diocese of Laon, in 1685; and entered into the congregation of St. Maur in 1703, where he was distinguished for his talents. Having officiated as professor of philology and theology in the abbey of St. Germain-des-Près, he was made sub-prior, and died in 1736. With his extensive literature, he combined a lively imagination and a turn for satire, which involved him in several controversies. He first opposed, and then warmly defended the bull "Unigenitus," on which subject he published two treatises. But he was more usefully employed in a French translation of Polybius, which appeared in 1721-28, in 6 vols. 4to. His version is elegant and faithful. Moreri.

THUIN, in *Geography*, a town of France, in the department of Jemappe, on the Sambre; 14 miles S.E. of Mons. N. lat. 50° 20'. E. long. 4° 21'.

THUIR, a town of France, in the department of the Eastern Pyrenées; 7 miles S.W. of Perpignan.

THULDEN, THEODORE VAN, in *Biography*, was one of the most distinguished among the pupils of Rubens, whom he assisted in forwarding the pictures of the Luxembourg gallery. He was born at Bois-le-Duc in 1607. He painted a considerable number of large works for the churches and public buildings of the principal towns and cities in Flanders; some of which have been honoured by being considered as from the hand of Rubens. Among the best of them are the Martyrdom of St. Sebastian, at Mechlin; the Martyrdom of St. Adrian, at Ghent; and the Assumption of the Virgin, formerly in the church of the Jesuits, at Bruges. He was engaged at Paris, which

he visited in 1633, to paint a series of pictures of the life of the patron saint of the Mathurins, St. John of Matha, which he afterwards etched and published in twenty-four plates. He is also the author of several other etchings from his own works and those of others; particularly of 58 plates of the life of Ulysses, from pictures painted at Fontainebleau by Primaticcio, of most of which there is now no other remembrancer than his etchings. He died in 1676, at the age of 69.

THULE, or THYLE, in *Ancient Geography*, an island of the Northern ocean, described in a very vague manner by the ancients; but which some maintain to have been the Shetland isles. Virgil (*Georg.* l. i. v. 30.) and Seneca (*Medea*, v. 379.) call this island "Ultima Thule." It is difficult to ascertain its precise situation. Strabo ascribes the ignorance and uncertainty that prevailed with regard to this island to its great distance, and charges Pytheas with having made many false reports concerning it. Ptolemy places the middle of this island in 63° of latitude, and says, that at the time of the equinoxes, the days were 24 hours, which could not have been true at the equinoxes, but must have referred to the solstices; and, therefore, this island is supposed to have been in 66° 30' lat. or under the polar circle. Stephanus Byzantinus says of this island, "Thula insula magna in oceano sub Hyperboreas partes ubi Ætivus dies ex viginti horis æqualibus constat, nox vero ex quatuor. Hybernæ vero dies é contrario." From this account it appears that the ancients described an island which was situated three degrees on this side of the polar circle; but its situation, if such an island existed, still remained very uncertain. As the ancients have not given us the dimensions of this island, some authors have concluded that the appellation of Thule was given to Scandinavia, of which the ancients had a very imperfect knowledge. According to Procopius (*l. iii. de Bell. Goth. c. 14.*) a party of the Etulians, when vanquished by the Lombards, sought an abode towards the extremities of the earth. With this view they traversed the country of the Slavonians; and in their progress entered into the country of the Varne, and into Denmark, and at length arrived on the ocean, where they embarked, and then landed on the island of Thule. This island, he adds, is ten times larger than Great Britain, and is far remote from the northern coast, a great part of it being desert. The habitable part was occupied by thirteen different classes of people, who had their respective kings. Towards the summer solstice, the sun appeared 40 days successively above their horizon; six months afterwards, the inhabitants had 40 days of night, which they passed in a state that was truly deplorable, as their commerce was totally interrupted. By the account of Procopius, it appears that the place to which he refers must have been beyond the polar circle, and of course beyond 63° lat., where Ptolemy placed the middle of Thule. Procopius says, that he often wished to visit this island, but was never able to accomplish his object; but he professes to have derived his information from persons who had actually visited the country, and he describes its aspect, and productions, and the manners of its inhabitants. His details correspond to the accounts that have been given of the ancient state of Lapland (which see); but this could not have been the Thule of the ancients. The descriptions transmitted to us from the ancients of their pretended isle of Thule are so intermixed with fabulous and incredible relations, that some modern geographers have even doubted whether such an island as they describe ever existed; others have supposed that they refer to Scandinavia, or some country far distant to the north, of which they could have

no certain and satisfactory accounts; and others again have been of opinion, that no islands to which modern voyagers have had access, correspond more exactly to their reports than the isles of Shetland, N. of Scotland. See *ZETLAND Islands*.

THULE, in *Geography*, a town of Westphalia, in the bishopric of Paderborn; 6 miles W.S.W. of Paderborn.

THULE, a river of Wales, in the county of Glamorgan, which runs into the Lloghor, near its mouth.

THULE, *Southern*, a part of Sandwich Land, observed by Capt. Cook in January 1775, in S. lat. 59° 13' 30" and W. long. 27° 45', and so called because it is the most southern land that has ever yet been discovered. It exhibits a surface of vast height, and is every where covered with snow. Some thought that they saw land in the space between Thule and Cape Brittol: Cook thought it more than probable that these two lands are connected, and that this space is a deep bay, which he called Forster's bay.

THUM, a town of Saxony, in the circle of Erzgebirg; 7 miles S. of Chemnitz. N. lat. 50° 37'. E. long. 12° 50'.—Also, a town of Bavaria, in the bishopric of Bamberg; 3 miles S.S.W. of Forchheim.

THUMATA, in *Ancient Geography*, a town of the Arabs, placed by Pliny on the banks of the Tigris, at a considerable distance from the town of Petra.

THUMATHA, a town situated in the interior of Arabia Felix, between Chabuata and Olaphia. Ptol.

THUMB, **POLLEX**, in *Anatomy*, one of the members or parts of the hand. See *EXTREMITIES*.

THUMB-Stall, a ferrule made of iron, horn, or leather, with the edges turned up, to receive the thread in making sails. It is worn on the thumb to tighten the stiches while sewing.

THUMELITHA, in *Ancient Geography*, a town of Africa, in Interior Libya, near the source of the river Cinyphis. Ptol.

THUMERVILLE, in *Geography*, a town of France, in the department of the Moselle; 6 miles S.W. of Briey.

THUMERSTONE, in *Mineralogy*; *Asinite*, Häüy. This mineral was called Thumerstone by Werner, from Thum, in Saxony, the place where it was found; and *Axinite* by Häüy, from the flattened sharp edges of the crystals resembling the edge of an axe. This is the first character which strikes the eye when this mineral is presented for inspection. It is most commonly found crystallized, but sometimes massive or difformated. The form of the crystals is a very compressed oblique rhomboidal prism. The primitive crystal, according to Häüy, is a four-sided prism, whose bases are parallelograms with very oblique angles: the larger angle being 101.32, and the smaller 78.28. In the secondary crystals, the acute edges are generally truncated. It is crystallized also in oblique four-sided tables. The form of the crystals is sometimes very difficult to be determined; they not unfrequently intersect one another, forming a cellular aggregation. The external lustre is generally splendid; internally it is glistening or shining, and is vitreous. It is transparent or translucent. The fracture is fine-grained and uneven; in the translucent varieties, it sometimes approaches to splintery; and in the transparent varieties, to the small and imperfectly conchoidal. It scratches glass; is harder than felspar, but not so hard as quartz; it is fragile, and fusible by the blow-pipe into a greenish-white glass, but if laid on charcoal into a black glass. The specific gravity is from 3.2 to 3.3. The colours of this mineral are most commonly a clove-brown of various degrees of intensity, inclining to violet and green.

It is sometimes green and opaque: according to Brongniart, this is owing to a mixture of chlorite. It has been observed, he remarks, that the crystals which are coloured with this earth are the most regular. The constituent parts are given by Klaproth and Vauquelin as under.

	Klaproth.	Vauquelin.
Silex - - -	52.70 and 50.50	44
Alumine - -	25.79	18
Lime - - -	9.39	19
Oxyd of iron -	8.63	14
Oxyd of manganese	1.	5.25
Potash - - -	0.25	4

This mineral occurs in Saxony, France, Switzerland, and Spain, and at mount Atlas, in Africa. It is found also massive and crystallized near St. Just, in Cornwall, at the Botellock mine, associated with common garnet, and in veins between Marazion and Penzance.

The most beautiful variety is met with in a rock of serpentine, near Balme d'Auris, in Dauphiny, in the department of the Isère; where it generally occurs in well-defined crystals, sometimes colourless and transparent, but more frequently of a dull reddish-violet colour, whence it obtained the name of violet schorl of Dauphiny. The crystals of thumerstone, which are not symmetrical, become electric by heat: it is indeed a general law, that all minerals which possess the pyro-electric property, are defective in the symmetry of the crystals.

THUMLITZ, in *Geography*, a river of Saxony, which runs into the Mulda; 3 miles S. of Grima.

THUMMIM, in the *Scripture Learning*. See **URIM** and **THUMMIM**.

THUMNA, in *Ancient Geography*, the name of two towns situated in the interior of Arabia Felix; one between Mochura and Aluare, and another between Mariama and Vodona. Ptol.

THUN, in *Geography*, a town of Switzerland, in the canton of Bern, at the distance of about 12 miles from the town of Bern. It occupies the bottom and brow of a hill, and stretches on both sides of the Aar. It contains 1200 inhabitants, enjoys considerable immunities, has its own magistrates and courts of justice, in which the bailiff from Bern always presides, and from whose decision an appeal always lies to the capital. The inhabitants employ themselves in carding and spinning silk for the manufactures of Basle. Some of the burghers possess large herds of cattle. To the N.E., on an eminence, stand the church, and the castle, which is the residence of the bailiff. N. lat. 46° 44'. E. long. 7° 31'.—Also, a lake of Switzerland, in the canton of Bern; about four leagues long, and one broad, and probably very deep: the borders are richly variegated, and present several fine points of view, much heightened by many rugged rocks rising boldly from the margin of the water. The river Aar passes through the lake of Brienz, and then enters that of Thun, from which it is again discharged, passing between two level promontories, prettily sprinkled with trees, on one of which stands the castle of Schadao; 15 miles S.S.E. of Bern.

THUNA, a town of Cachemire; 45 miles S. of Cachemire.

THUNBERGIA, in *Botany*, received that name first from professor Retzius, and next in the *Supplementum Plantarum*, from the pen of the younger Linnæus, in honour of their mutual friend, sir Charles Peter Thunberg, knight of the order of Wafa, by whose discoveries that work was peculiarly enriched with new and curious species, especially from the Cape of Good Hope. This illustrious veteran still

sits in the professorial chair of Rudbeck and Linnæus at Upsal, after having essentially added to the general stock of knowledge by his Travels to Japan, his Floras of that country and of the Cape, and his very numerous academical dissertations. The liberal communications, and amiable character of professor Thunberg, have secured him no less personal esteem than his extensive application and knowledge. His constitution, though shaken by a terrible misfortune in his voyage, the accidental use of white lead in his food, which proved fatal to some of his mess-mates, has still carried him on to the advanced age of 73.—Retz. Act. Lund. v. 1. 163. Linn. Suppl. 46. Schreb. Gen. 426. Willd. Sp. Pl. v. 3. 388. Mart. Mill. Dict. v. 4. Ait. Hort. Kew. v. 4. 65. Thunb. Nov. Gen. 21. Prodr. 106. Juss. 103. Lamarck Illustr. t. 549.—Class and order, *Didymia Angiospermia*. Nat. Ord. *Personate*, Linn. *Acanthi*, Juss.

Gen. Ch. Cal. Perianth inferior, double, permanent: the outermost of two ovate, obtuse, ribbed, equal leaves, as long as the tube of the corolla: inner of one leaf, in many, about twelve, awl-shaped erect segments, not one-third so long as the former. Cor. of one petal, falver-shaped: tube gradually dilated upwards: limb in five deep, nearly equal, obovate, very abrupt segments, about half the length of the tube. Stam. Filaments four, awl-shaped, inserted into the tube, the two lower ones shortest, all included within the tube; anthers arrow-shaped. Pist. Germen superior, roundish; style thread-shaped, erect, hardly so long as the tube; stigma of two rounded flat lobes. Peric. Capsule globose with a beak, smooth, or two cells and two valves, bursting lengthwise: the beak linear, obtuse, compressed, furrowed; partition obovate, emarginate, perforated below the summit, membranous at the sides, permanent. Seeds two in each cell, kidney-shaped, rugged, convex on the outside, concave on the inner, with a longitudinal furrow.

Ess. Ch. Calyx double; the outer of two leaves; inner in many awl-shaped segments. Corolla falver-shaped, with five regular lobes. Capsule beaked, of two cells.

Obs. Linnæus remarks that this genus agrees in many points with *Barleria*. Thunberg takes the outer calyx-leaves for bractæas, but this is not countenanced by the altogether peculiar appearance of the inner calyx, by no means like an external perianth.

1. *T. capensis*. Diffuse Thunbergia. Linn. Suppl. 292. Willd. n. 1. Retz. Act. Lund. v. 1. 163, with a figure.—Leaves roundish-ovate, obtuse. Stem diffuse.—Native of the Cape of Good Hope. The root seems to be perennial. Stems a finger's length, diffuse, simple, leafy, square, hairy. Leaves opposite, on short hairy stalks, entire or somewhat toothed, hardly an inch long, strongly reticulated with veins: very rough with minute bristles above; hairy beneath. Flowers yellow, on simple, solitary, striated, erect, axillary, hairy stalks, twice the length of the leaves. Outer calyx very hairy; inner rigid, with almost pungent points. Corolla about an inch long, its segments somewhat rounded. Capsule rigid, about the same length.

2. *T. fragrans*. Twining Thunbergia. Roxb. Corom. v. 1. 47. t. 67. Willd. n. 2. Ait. n. 1. Andr. Repof. t. 123.—Leaves ovate-oblong, somewhat heart-shaped, acute. Stem twining.—Common in hedges, among bushes, on the banks of water-courses, about Samulcotah, flowering in the wet and cold seasons. Dr. Roxburgh never met with it any where else. He says the plant possesses a peculiar and agreeable fragrance, and the beauty of its flowers, though not fragrant, entitles it to a place in the flower-garden. No scent has been discovered in any part of this plant in our itoves, where it blossoms freely all summer long. The long

and twining stems readily distinguish this species from the foregoing, as well as the elongated form of the leaves, which are occasionally angular, or toothed, near the base. The flowers are white, larger, and with a narrower tube than the *capensis*, their segments more abrupt or somewhat notched.

It appears by the Linnæan herbarium that the younger Linnæus had originally defined the name of *Solandra* for this genus.

Another *Thunbergia* was previously established by Dr. Montin, in the Stockholm Transactions for 1773, but the noble plant on which it was founded proved a *GARDENIA*. See that article.

THUNDER, a noise in the lowest region of the air, excited by a sudden explosion of electrical clouds; which, on this account, are called thunder-clouds.

Seneca, Rohault, and other authors, both ancient and modern, account for thunder by supposing two clouds impending over one another, the upper and rarer of which, becoming condensed by a fresh accession of air raised thither by warmth from the lower parts of the atmosphere, or driven upon it by the wind, immediately falls forcibly down upon the lower and denser cloud: by which fall the air interposed between the two being compressed, that next the extremities of the two clouds is squeezed out, and leaves room for the extremity of the upper cloud to close tight upon the under; thus a great quantity of air is enclosed, which, at length escaping through some winding irregular vent or passage, occasions that noise which we call thunder.

But this could only reach to the phenomena of thunder heard without lightning; and, therefore, recourse has been had to another solution. It has been said, that thunder is not occasioned by the falling of clouds, but by the kindling of sulphurous exhalations, in the same manner as the noise of aurum fulminans.

"There are sulphurous exhalations," says sir Isaac Newton, "always ascending into the air when the earth is dry; there they ferment with the nitrous acids, and sometimes taking fire, generate thunder, lightning, &c."

That, besides the vapours raised from water, &c. there are also exhalations carried off from sulphur, bitumen, volatile-salts, &c. is past all doubt; the vast quantity of sulphurous and bituminous matter all over the surface of the earth, and the volatile salts of plants and animals, afford such an ample stock of them, that it is no wonder the air should be filled with such particles, raised higher or lower, according to their greater or less degree of subtlety and activity; and more copiously spread in this or that quarter, according to the direction of the winds.

Now, the effects of thunder are so like those of fired gunpowder, that Dr. Wallis thinks we need not scruple to ascribe them to the same cause; and the principal ingredients in gunpowder, we know, are nitre and sulphur; charcoal only serving to keep the parts separate, for their better kindling.

Hence, if we conceive in the air a convenient mixture of nitrous and sulphurous particles, from the sources above mentioned; and those, by any cause, to be set on fire, such explosion may well follow; and with such noise and light, the two phenomena of thunder, as in the firing of gunpowder; and being once kindled, it will run from place to place, this way or that, as the exhalations happen to lead it; much as is found in a train of gunpowder.

This explosion, if high in the air, and remote from us, will do no mischief; but if near us, may destroy trees, animals, &c. as gunpowder would do in the like circumstances.

This nearness, or distance, may be estimated by the interval

terval of time between the flash and the noise. Dr. Wallis observes, that, ordinarily, the difference between the two is about seven seconds, which, at the rate of 1142 feet in a second of time, gives the distance about a mile and a half; but sometimes it comes in a second or two, which argues the explosion very near us, and even among us. And in such cases, the doctor assures us, he has more than once foretold the mischiefs that happened.

Upon the whole, that there is in lightning a sulphurous vapour has been argued from the smell of sulphur which attends it, and from the sultry heat in the air which usually precedes it; and that there is a nitrous vapour along with it, the same writer concludes hence, that we know of no other body so liable to a sudden and violent explosion. And as to the kindling of these materials, we know that a mixture of sulphur and steel-sfilings, with a little water, will of itself break forth into actual flame. Nothing, therefore, is wanting to the explosion but some chalybeate or vitriolic vapour; and, among the various effluvia from the earth, the doctor does not doubt but there must be some of that kind; but, in proof of what he leaves as a probability, the following facts have been alleged.

In history, we meet with instances of its raining iron in Italy, and iron-stones in Germany. Jul. Scaliger tells us, he had by him a piece of iron rained in Savoy. Cardan reports 1200 stones to have fallen from heaven, some of them weighing 30, some 40, and one 120 pounds, all very hard, and of the colour of iron.

The matter of fact is so well attested, that Dr. Lister, in the Philosophical Transactions, builds a whole theory of thunder and lightning on it; maintaining that they both owe their matter to the vapour or exhalation of the pyrites.

The noise of thunder, and the flame of lightning, are easily made by art. If a mixture of oil or spirit of vitriol be made with water, and some filings of steel added to it, there will immediately arise a thick smoke or vapour out of the mouth of the vessel; and if a lighted candle be applied to this, it will take fire, and the flame immediately descend into the vessel, and this will be burst to pieces with a noise like that of a cannon.

This is so far analogous to thunder and lightning, that a great explosion and fire are occasioned by it; but in this they differ, that this matter when once fired is destroyed, and can give no more explosions; whereas, in the heavens, one clap of thunder usually follows another, and there is a continued succession of them for a long time. M. Homberg explained this by the lightness of the air above us in comparison of that here, which therefore would not suffer all the matter so kindled to be dissipated at once, but kept it for several returns.

Ever since the year 1752, in which the identity of the matter of lightning, and of the electric fluid, has been ascertained, philosophers have generally agreed in considering thunder as a concussion produced in the air by an electrical explosion. For the illustration and proof of this theory, see LIGHTNING. See also ELECTRICITY.

We shall here observe, that Mr. Henry Eeles, in a letter written in 1751, and read before the Royal Society in 1752, considers the electrical fire as the cause of thunder, and endeavours to account for it on this hypothesis; and he tells us, that he did not know of any person's having made the same conjecture. Phil. Transf. vol. xlvii. p. 524, &c.

That rattling in the noise of thunder, which makes it seem as if it passed through arches, or were broken variously, is probably owing to the sound being excited among clouds

hanging over one another, and the agitated air passing irregularly between them.

See this phenomenon particularly accounted for under LIGHTNING.

THUNDER-Bolt. If what we call lightning acts with extraordinary violence, and breaks or shatters any thing, it is called a thunderbolt, which the vulgar, to fit it for such effects, suppose to be a hard body, and even a stone.

But that we need not to have recourse to a hard solid body to account for the effects commonly attributed to the thunderbolt, will be evident to any one, who considers those of the pulvis fulminans, and of gunpowder: but more especially the astonishing powers of electricity, even when collected and employed by human art, and much more when directed and exercised in the course of nature.

When we consider the known effects of electrical explosions, and those produced by lightning, we shall be at no loss to account for the extraordinary operation vulgarly ascribed to thunderbolts. As stones and bricks struck by lightning are often found in a vitrified state, we may reasonably suppose, with signior Beccaria, that some stones in the earth, having been struck in this manner, first gave occasion to the vulgar opinion of the thunderbolt.

Places struck with thunderbolts were held sacred among the ancients. Nigidius has a curious treatise on the thunderbolt.

The ancient painters and poets have armed Jupiter with a sort of flaming dart, called a thunderbolt. Thus, it is said, he became master both of gods and men.

These thunderbolts are forged for Jupiter, according to the poets, by the Cyclopes.

The thunderbolt, in antiquity, represented sovereignty, and a power equal to the gods; on this account, Apelles painted Alexander, in the temple of Diana of Ephesus, holding a thunderbolt in his hand: and on medals, the thunderbolt is sometimes found to accompany the emperor's heads, as that of Augustus.

Appian informs us, that the thunderbolt was the principal divinity of Seleucia; adding, that it was adored, even in his time, with various hymns and ceremonies.

THUNDER-Clouds, in *Physiology*, are those clouds which are in a state fit for producing lightning and thunder. From signior Beccaria's exact and circumstantial account of the external appearances of thunder-clouds, we shall extract the following particulars.

The first appearance of a thunder-storm, (which generally happens when there is little or no wind), is one dense cloud, or more, increasing very fast in size, and rising into the higher regions of the air. The lower surface is black, and nearly level; but the upper finely arched, and well defined. Many of these clouds often seem piled upon one another, all arched in the same manner; but they keep continually uniting, swelling, and extending their arches.

At the time of the rising of this cloud, the atmosphere is generally full of a great number of separate clouds, motionless, and of odd and whimsical shapes. All these, upon the appearance of the thunder-cloud, draw towards it, and become more uniform in their shapes as they approach, till, coming very near the thunder-cloud, their limbs mutually stretch towards one another; they immediately coalesce, and together make one uniform mass. These he calls *adscititious* clouds, from their coming in, to enlarge the size of the thunder-cloud.

But sometimes the thunder-cloud will swell, and increase very fast, without the conjunction of any adscititious clouds; the vapours in the atmosphere forming themselves into clouds

wherever it passes. Some of the adscitious clouds appear like white fringes at the skirts of the thunder-cloud, or under the body of it, but they keep continually growing darker and darker, as they approach to unite with it.

When the thunder-cloud is grown to a great size, its lower surface is often ragged, particular parts being detached towards the earth, but still connected with the rest. Sometimes the lower surface swells into various large protuberances, bending uniformly toward the earth. And sometimes one whole side of the cloud will have an inclination to the earth, and the extremity of it will nearly touch the earth. When the eye is under the thunder-cloud, after it is grown larger, and well formed, it is seen to sink lower, and to darken prodigiously; at the same time that a number of small adscitious clouds (the origin of which can never be perceived) are seen in a rapid motion, driving about in very uncertain directions under it. While these clouds are agitated with the most rapid motions, the rain generally falls in the greatest plenty, and if the agitation be exceedingly great, it commonly hails.

While the thunder-cloud is swelling, and extending its branches over a large tract of country, the lightning is seen to dart from one part of it to another, and often to illuminate its whole mass. When the cloud has acquired a sufficient extent, the lightning strikes between the cloud, and the earth, in two opposite places, the path of the lightning lying through the whole body of the cloud and its branches. The longer this lightning continues, the rarer does the cloud grow, and the less dark is its appearance; till, at length, it breaks in different places, and shews a clear sky. When the thunder-cloud is thus dispersed, those parts which occupy the upper regions of the atmosphere are equally spread, and very thin; and those that are underneath are black, but thin too; and they vanish gradually, without being driven away by any wind.

These thunder-clouds were sometimes in a positive as well as negative state of electricity. The electricity continued longer of the same kind, in proportion as the thunder-cloud was simple and uniform in its direction; but when the lightning changed its place, there commonly happened a change in the electricity of the apparatus over which the clouds passed. It would change suddenly after a very violent flash of lightning, but the change would be gradual when the lightning was moderate, and the progress of the thunder-cloud slow. Beccar. Lettere dell' Ellettricismo, p. 107; or Priestley's Hist. Electr. vol. i. p. 397, &c. See LIGHTNING.

THUNDER-HOUSE, in *Electricity*, is an instrument invented by Dr. James Lind of Edinburgh, for illustrating the manner by which buildings receive damage from lightning, and to evince the utility of metallic conductors in preserving them from it.

A (*Plate XV. Electricity, fig. 2.*) is a board about three quarters of an inch thick, and shaped like the gable-end of a house. This board is fixed perpendicularly upon the bottom board B, upon which the perpendicular glass pillar CD is also fixed in a hole about eight inches distant from the basis of the board A. A square hole ILMK, about a quarter of an inch deep, and nearly an inch wide, is made in the board A, and is filled with a square piece of wood, nearly of the same dimensions. It is nearly of the same dimensions, because it must go so easily into the hole, that it may drop off, by the least shaking of the instrument. A wire, LK, is fastened diagonally to this square piece of wood. Another wire, IH, of the same thickness, having a brass ball, H, screwed on its pointed extremity, is fastened upon the

board A: so also is the wire MN, which is shaped in a ring at O. From the upper extremity of the glass pillar CD, a crooked wire proceeds, having a spring socket F, through which a double knobbed wire slips perpendicularly, the lower knob, G, of which falls just above the knob H. The glass pillar DC must not be made very fast into the bottom board; but it must be fixed so that it may be pretty easily moved round its own axis, by which means the brass ball G may be brought nearer or farther from the ball H, without touching the part EFG. Now when the square piece of wood LMIK (which may represent the shutter of a window or the like) is fixed into the hole so that the wire LK stands in the dotted representation IM, then the metallic communication from H to O is complete, and the instrument represents a house furnished with a proper metallic conductor; but if the square piece of wood LMIK is fixed so that the wire LK stands in the direction LK, as represented in the figure, then the metallic conductor HO, from the top of the house to its bottom, is interrupted at IM, in which case the house is not properly secured.

Fix the piece of wood LMIK, so that its wire may be as represented in the figure, in which case the metallic conductor HO is discontinued. Let the ball G be fixed at about half an inch perpendicular distance from the ball H, then, by turning the glass pillar DC, remove the former ball from the latter; by a wire or chain connect the wire EF with the wire Q of the jar P, and let another wire or chain, fastened to the hook O, touch the outside coating of the jar. Connect the wire Q with the prime conductor, and charge the jar; then, by turning the glass pillar DC, let the ball G come gradually near the ball H, and when they are arrived sufficiently near one another, you will observe, that the jar explodes, and the piece of wood LMIK is pushed out of the hole to a considerable distance from the thunder-house. Now the ball G, in this experiment, represents an electrified cloud, which, when it is arrived sufficiently near the top of the house A, the electricity strikes it, and as this house is not secured with a proper conductor, the explosion breaks part of it, *i. e.* knocks off the piece of wood IM.

Repeat the experiment with only this variation, *viz.* that this piece of wood IM is situated so that the wire LK may stand in the situation IM; in which case the conductor HO is not discontinued; and you will observe that the explosion will have no effect upon the piece of wood LM, this remaining in the hole unmoved; which shews the usefulness of the metallic conductor.

Farther, unscrew the brass ball H from the wire HI, so that this may remain pointed, and with this difference only in the apparatus repeat both of the above experiments, and you will find that the piece of wood IM is in neither case moved from its place, nor any explosion will be heard, which not only demonstrates the preference of conductors with pointed terminations to those with blunted ones, but also shews that a house furnished with sharp terminations, although not furnished with a regular conductor, is also sufficiently guarded against the effects of lightning.

Mr. Henly, having connected a jar containing 509 square inches of coated surface with his prime conductor, observed that if it was so charged as to raise the index of his electrometer to 60°, by bringing the ball on the wire of the thunder-house, to the distance of half an inch from that connected with the prime conductor, the jar would be discharged, and the piece in the thunder-house thrown out to a considerable distance. Using a pointed wire for a conductor to the thunder-house, instead of the knob, the charge being the same

fame as before, the jar was discharged silently, though suddenly; and the piece was not thrown out of the thunder-house. In another experiment having made a double circuit to the thunder-house, the first by the knob, the second by a sharp-pointed wire, at one and one-fourth of an inch distance from each other, but of exactly the same height (as in *fig. 3.*) the charge being the same; although the knob was brought first under that connected with the prime conductor, which was raised half an inch above it, and followed by the point, yet no explosion could fall upon the knob; the point drew off the whole charge silently, and the piece in the thunder-house remained unmoved. *Phil. Transf. vol. lxiv. part i. p. 136. See POINTS, in Electricity.*

THUNDER-Stone, in *Natural History*, the same with that called by authors *brontia*.

THUNDER-Storm. See **THUNDER-Clouds**.

THUNDER Bay, in *Geography*, a bay in lake Huron, about nine miles long, and nearly as many broad. The Indians who reside near, and all European travellers who have passed this bay, agree to call it by the present name, on account of the continual thunder they observe. N. lat. 44° 50'. W. long. 83° 30'.—Also, a bay on the N. part of lake Superior.

THUNDERING LEGION, *Legio Fulminans*, was a legion in the Roman army, consisting of Christian soldiers, who in the expedition of the emperor Marcus Aurelius Antoninus against the Sarmatæ, Quadi, and Marcomanni, A.D. 174, are said to have saved the whole army, then ready to perish with thirst, by procuring, with their prayers, a very plentiful shower on them; and at the same time a furious hail, mixed with lightning and thunderbolts, on the enemy, and thus he obtained a decisive victory.

This is the account commonly given by ecclesiastical historians; and the whole story is engraven in bas-reliefs on the Antonine column. And hence arose the denomination *thunderers*: though some say, that the legion those Christians were of was called the *thundering legion* before.

This deliverance has been thought by many to have been miraculous, owing to the prayers of the Christians who were in the Roman army; and it has been supposed, that the emperor wrote a letter to the senate on this occasion, which was very favourable to the Christians; others, however, have thought, that the Christians, by a pious sort of mistake, attributed this unexpected and seasonable shower, which saved the Roman army, to a miraculous interposition; and this opinion, says Mosheim, is indeed supported by the weightiest reason as well as by the most respectable authorities; and the letter of Marcus Antoninus is allowed, even by the defenders of the miracle of the thundering legion, to have in it manifest tokens of spurioufness, to be the work of a man unskilful in Roman affairs, and who probably lived in the seventh century. Mosheim sums up the arguments on this subject in the following manner: it is certain, he says, that the Roman army enclosed by the enemy, and reduced to the most deplorable and even desperate condition by the thirst under which they languished in a parched desert, was revived by a sudden and unexpected rain. It is also certain, that both the Heathens and the Christians looked upon this event as extraordinary and miraculous; the former attributing it to Jupiter, Mercury, or the power of magic; the latter to Christ, interposing, thus unexpectedly, in consequence of their prayers. It is still farther beyond all doubt, that a considerable number of Christians served, at this time, in the Roman army, and it is extremely probable, that in such trying circumstances of calamity and distress, they explored the merciful interposition and succours of their God and Saviour. And as the Christians of the time looked

upon all extraordinary events as miracles, and ascribed to their prayers all the uncommon and singular occurrences of an advantageous nature that happened to the Roman empire, it will not appear surprizing, that upon the present occasion they attributed the deliverance of Antoninus and his army to a miraculous interposition which they had obtained from above. But, on the other hand, it must be carefully observed, that it is an invariable maxim universally adopted by the wise and judicious, that no events are to be esteemed miraculous, which may be rationally attributed to natural causes, and accounted for by a recourse to the ordinary dispensations of providence; and as the unexpected shower, which restored the expiring force of the Romans, may be easily explained without rising beyond the usual and ordinary course of nature, the conclusion is manifest; nor can it be doubtful in what light we are to consider that remarkable event. *Eccl. Hist. vol. i. 8vo. edit.*

Mr. Moyle and Mr. King had a curious and interesting controversy on the subject of the thundering legion. The learned Dr. Lardner has collected into one view every thing relating to it of importance, in his *Collection of Jewish and Heathen Testimonies*, vol. ii. ch. xv. sect. iii. p. 221, &c.

THUNGEN, in *Geography*. See **TIENGEN**.

THUNOE, a small island of Denmark, between the coast of Jutland, and the island of Samsoe. N. lat. 55° 58'. E. long. 10° 27'.

THUNUDROMUM, in *Ancient Geography*, a town, with the title of a Roman colony, in Africa, in New Numidia, according to Ptolemy. It is named *Tynidrumense Oppidum* by Pliny.

THUNUSDA, a town of Africa Propria, according to Ptolemy, denominated by Pliny *Thunusidense Oppidum*.

THUPÆ, or **THUPPÆ**, a town of Africa, in the interior of Libya, upon the southern banks of the Niger. *Ptol.*

THUPPA, a town of Africa, in the interior of Libya, upon the northern bank of the river Gira.

THUR, in *Geography*, a river of Switzerland, which rises in the south part of the county of Toggenburg, and runs into the Rhine, 7 miles S.S.W. of Schaffhausen.

THURE, a town of France, in the department of the Vienne; 4 miles W. of Châtellerault.

THUREN, a river of France, which rises in the department of the Upper Rhine, passes by Thann, &c. and joins the Ill at Ensisheim.

THURGAU, a country of Switzerland, with the title of landgrate; bounded on the north by Swabia and the lake of Constance, on the east by the lake of Constance, on the south by the territories of St. Gall, and on the west by the cantons of Zurich and Schaffhausen. It receives its name from the river Thur, and, in its most extensive sense, comprehends all the extent of country on both sides of that river. Though somewhat mountainous towards the south, yet it affords rich pastures; and its other parts, as approaching nearer to levels, produce plenty of grain, with vegetables and fruits of all kinds, as also wine. The country is populous, and well cultivated, containing six towns, with several handsome burghs, a great number of seats, and upwards of 170 villages. About one-third of the inhabitants consists of Roman Catholics, and in church affairs are subject to the bishop of Constance. The other two-thirds, ever since the year 1543, have been Calvinists. The Thurgau is a very ancient landgrate, which, on the extinction of the counts of Old or Hohen Frauenfelden, devolved to those of Kiburg, and, on their failure, to the counts of Habsburg, with whom it came to the house of Austria, which continued possessed of it till 1460, in which year the Switzers, being at war with the archduke Sigismund, wrested this country from him, which,

by

by the peace concluded at Constance in the following year, was confirmed to them. The cantons to which the territorial sovereignty of this country belongs, are the eight old cantons of Zurich, Bern, Lucerne, Schweitz, Underwalden, Zug, and Glaris; but it was not till the peace of Arau, that the second was admitted by the others as a co-sovereign. These eight every two years alternately appoint a landvogt over it, who resides at Frauenfeld; and since the year 1449, the cantons of Friburg and Soleure have also obtained a seat in its criminal court.

THURGOLAND, a township of Yorkshire, in the West Riding; 4 miles S.W. of Barnesley.

THURIA, in *Ancient Geography*, a town of Messenia, on the river Aris, S.W. of Alagonia. It had a temple dedicated to the goddesses Astarte, a Syrian divinity, supposed to be the same with Venus.—Also, an island on the Ægean sea, near Naxos, according to Plutarch.

THURIBULUM, among the Romans, a censor, or vessel, in which incense was burnt at sacrifices.

THURIFICATI, in *Church History*, a designation given to those who, to avoid the persecution of the Roman emperors, offered frankincense to the heathen gods.

THURII MONTES, in *Ancient Geography*, mountains of Italy, in Magna Græcia.

THURINGII, **THURINGIANS**, a people of Germany, supposed by some authors to have been a part of the Vandals. They have been scarcely known in history since the fall of the Roman empire. Towards the end of the fifth or commencement of the sixth century, Thuringia had a king, or at least a warlike chief.

THURINGIA, in *Geography*, a circle of Saxony, which forms the N. part of the landgraviate of that name. The country is well watered, yields good pasturage, and abundance of corn, particularly wheat, which is excellent, as also fine timber-wood, safflower, anise, fennel, and wine; and has also a considerable breed of horses, horned cattle, and sheep. Of these natural productions of the country, a great part is exported. Thuringia contains in it 60 towns, 674 villages, and 300 noble estates. The modern Thuringia, which lies nearly between the Saale and the Werra, is but a part of the ancient Thuringia, a country formerly comprized under that name, extending itself much farther every way. In the sixth century, the Franks and Saxons subjected the Thuringians to their dominions, whose country from that time forwards became divided into the North and South. North Thuringia, towards the N., extends itself beyond Harzwalde, quite to the river Elbe, and belonged to the Saxons. It was united with the duchy of Saxony, lost its name, and was at length annexed to Eastphalia, or to the eastern part of the county of Saxony. South Thuringia belonged to the Franks, and comprized in it the modern Thuringia, together with a large share of the modern Franconia, Hesse, &c. Till the eleventh century, it stood under the emperors and kings, and besides the counts, we find also some dukes mentioned, to whom the German kings entrusted the government of this country. Ever since the thirteenth century, the margraves of Meissen, who afterwards became electors of Saxony, have been in possession of the landgraviate of Thuringia, which was at one time divided among separate lines, but returned again by the extinction of the latter to that of Meissen. It has been ceded to Prussia by the king of Saxony.

THURIS, in *Ancient Geography*, a town situated in the interior of Arabia Felix. Ptol.

THURIUM, a town which succeeded the ancient *Sybaris*; which see.

THURLES, in *Geography*, a post-town of the county

of Tipperary, Ireland, situate on the river Suire, which divides it nearly into two equal parts. There was formerly a castle belonging to the knights of St. John of Jerusalem, and there are still some ruins of a monastery. Thurles is 70 miles S.W. from Dublin.

THURLMERE, a lake of England, in the county of Cumberland, from whence a river runs to the Derwent; 3 miles S.E. of Keswick.

THURLOE, **JOHN**, in *Biography*, secretary of state to the Protectorate, was the son of Thomas Thurloe, rector of Abbot's Roding, in Essex, where he was born in 1616. He was brought up to the law, and in 1644-5, by the interest of Oliver St. John, was appointed one of the secretaries to the parliamentary commissioners at the treaty of Uxbridge. Advancing through other offices, he went as secretary to lord chief justice St. John, and Mr. Strickland, in their embassy to the States-General. In 1652 he rose to the office of secretary to the council of state; and when Cromwell, in 1653, assumed the protectorate, he was nominated his secretary, on whom he reposed peculiar confidence. In 1655 he was entrusted with the management of the post-office; and in 1656 he represented the isle of Ely in parliament. On the death of Cromwell he signed the order for proclaiming Richard, and in the following parliament was returned member for the university of Cambridge. He retained his office of secretary under Richard, and also under the parliament that deposed him. On the restoration, he was accused of high treason and examined, but soon set at liberty. He then retired to his seat in Oxfordshire, and visited London, at his chambers in Lincoln's Inn, in term-time. Charles II. often invited him to take a part in his administration: but he declined it, alleging that perhaps he should not be able to serve the king, as he had done the protector, in connection with men of different characters and principles; the protector, as he told his majesty, was used "to seek out men for places, and not places for men." The abilities of Thurloe for public life were distinguished, and his character in private life no less amiable. He died in Lincoln's Inn, where he was master of the bench, in 1667-8, and was interred in the chapel. His state papers formed a valuable historical collection, and were published by Dr. Birch, in 7 vols. fol. 1742. *Biog. Brit. Gen. Biog.*

THURLOW, in *Geography*, a township of Upper Canada.

THURLOW'S ISLAND, a narrow island in the Pacific Ocean, near the coast of North America, about 24 miles in length from E. to W. N. lat. 50° 24'. E. long. 233° 35'.

THURMAN, a post-township of the United States, in the state of New York, and county of Washington, erected in 1792 from Queensbury, and then comprising a great extent of territory, which has been since subdivided into other towns. Thurman is bounded N. by Chester and Johnsbury, E. by Caldwell and Bolton, S. by Saratoga county, and W. by Montgomery county. The first settlements commenced about 1786, and in 1810 there were about 200 families, mostly Scots, and the rest from the eastern states. It has one Presbyterian and one Methodist meeting-house, and a pretty competent number of common school-houses and schools. The whole township is well watered, and Crain's mountain in the W. part of it is rich in mineral treasures. Much of this western part is still unsettled.

THURN, a town of the duchy of Stiria; 5 miles S. of Windisch Gratz.

THURN Am Hardt, a town of the duchy of Carniola; 2 miles S. of Gurckfeld.

THURNAU, a town of Germany, in the principality of Culmbach; 5 miles S.S.W. of Culmbach. N. lat. 50° 2'. E. long. 11° 26'.

THURNEISSER, LEONARD, in *Biography*, a man of great temporary celebrity in chemistry and the occult sciences, was born at Basle in the year 1530. Having imprudently, in 1547, when a boy, married a widow, who proved unfaithful; and having involved himself in debt, he found himself under a necessity of leaving both his wife and his native place. Accordingly, in 1548 he went to Strasburg, and from thence he proceeded to Constance, having, by diligent application to his trade of a goldsmith, amassed a considerable sum of money. He employed himself in the construction of mathematical instruments, and in a variety of metallurgic operations with such reputation, that he was entrusted with the direction of the smelting works at Eberwold in the Tyrol. During his abode at Constance, he married the daughter of a goldsmith by whom he had been employed, and in 1558 retired with her to Tarenz in the Upper Innthal, where he formed metallurgic establishments on his own account, and constructed furnaces, together with a manufactory for the preparation of sulphur. Here he was visited by several persons of eminence, and became known to the emperor Ferdinand; and patronised by the emperor's son, the archduke Ferdinand, he travelled, by his consent, in 1560, to Scotland and the Orkney islands, and in 1561 to Portugal and Spain, and also to some parts of Africa and Asia. On the summit of mount Sinai he received the order of St. Catharine; and in his way home he visited Candia, Greece, Italy, and Hungary. When he arrived in the Tyrol, he found his establishments in great confusion; but he was enabled by the government of Inspruck to revive and support them. He was then deputed by the archduke to examine the mines in Hungary and Bohemia; but notwithstanding this high patronage, he involved himself in debt, and by his pride and extravagance forfeited the favour of his patrons. In 1569 he obtained leave to visit Lower Germany, for the purpose of making some observations in natural history, and of superintending the printing of some of his works. During the leisure afforded by some of his sea-voyages, he had composed, in German verse, a work intitled "Archidoxia," or an account of the influence which the planets have on the human body, and on all the employments of man; together with a secret introduction to alchemy. He had prepared also another work, called the "Quintessence," in which he pointed out the connection between medicine and alchemy, and gave instructions how to extract from all substances their quintessence or subtle parts. He pretended also to have made some other curious discoveries, which we cannot detail. At Munster he published, in 1569, the first edition of his "Archidoxia," in 4to.; and his "Quintessence" was printed there, also in 4to., in 1570. These works were afterwards enlarged and published in folio. Thurneisser, quarrelling with the bishop, left Munster and removed to Frankfort on the Oder, to print his "Pison," or Description of Rivers, by which, together with his calendar and book on plants, he acquired the greatest share of his reputation. Having cured the margravine of Brandenburg of a dangerous illness, the margrave appointed him his physician, and defrayed the expence of bringing his wife and family from Constance. In 1572 he published his work "On Urine," in which he asserts, that by examining the urine of Sigismund I. of Poland, he had discovered the nature of his disease, and predicted his death, with the day on which it would happen. Under the patronage of the margrave of Brandenburg he went on prosperously with his laboratory and printing-press; and indulged in the most expensive and splendid mode of dress and living. His visitors were numerous, and of the first rank; and among his correspondents

were the emperor Maximilian, and Elizabeth queen of England. He was consulted not only in all kinds of diseases, but on witchcraft, magic, and other such matters. His printing-press was in high estimation. By printing, and the sale of his MSS. and prescriptions, he acquired great wealth. For the MSS. the elector, John Gruge, gave him 9000 dollars; and there was formerly in the king's library at Berlin, a MS. entitled "De Transmutatione Veneris in Solem," for which an annual pension of 600 dollars was settled on him and his children. He was the first person who formed a collection of natural curiosities in the Marche of Brandenburg. He had also a garden filled with plants for the study of botany, and a menagerie, containing a collection of various animals from all parts of the world. In 1575 he lost his second wife, who arranged all his affairs with great prudence; and this was the era of his downfall. From opulence he was reduced to poverty. His reputation as a physician declined. Dr. Hoffman of Francfort, in his oration "De Barbarie Imminente," was formidable to his credit, and he contrived means to prevent its being printed till the year 1578. Thurneisser, fearing utterly to lose his character, prepared for his departure from Berlin, and retired to Basle, where, in 1580, he married a third wife. Withdrawing from domestic inquiet into Italy, he is said to have converted, in the presence of the grand duke, Francesco de Medici, one half of an iron nail into gold. This singular man died in 1595, or 1596, in a monastery at Cologne, after requesting that his body might be interred close to that of Albert the Great. A list of his works is given by Haller in his Bibliotheca. Gen. Biog.

THUROTZ, in *Geography*, a river of Hungary, which runs into the Waag, 12 miles N. of St. Martin. It gives name to a county.

THURROCK GRAYS, or GREAT THURROCK, a market-town in the hundred of Chafford, and county of Essex, England; is situated 22 miles S.S.W. from Chelmsford, and 24 miles E. by S. from London. It acquired the appellation of Grays from the noble family of that name, who possessed the manor for upwards of three centuries, from the year 1194, when it was granted to them by king Richard I. The town consists principally of one irregular street, on the banks of a small creek from the Thames, navigable for hoys and vessels of small burthen. A weekly market is held on Thursdays, chiefly for the sale of corn, and is much frequented: here is also an annual fair. The church is built in the form of a cross, with a tower on the north side. By the return under the population act of the year 1811, this parish was stated to contain 214 houses, and 1055 inhabitants.

In the adjacent parishes of Chadwell and Little Thurrock are various caverns, or holes, of unequal depths and dimensions, formed in the chalk, which here constitutes the upper stratum: they appear to open from the top by a narrow circular passage, which near the bottom begins to spread, and communicates with subterranean apartments of different forms. Dr. Derham measured six of these caverns, and reports them to be of various depths, from fifty to eighty feet. The origin of these excavations is uncertain; the opinion of some modern writers, that they were the granaries of the Britons, seems by far the most rational supposition. They are also called Dane Holes, and traditionally reported to have been used as receptacles or hiding-places for plunder during the frequent incursions of the Danes into this island.—*Beauties of England and Wales*, vol. v. Essex; by J. Britton and E. W. Brayley.

THURSDAY, the fifth day of the Christians' week, but the sixth of that of the Jews. See **THOR** and **WEEK**.

THURSDAY,

THURSDAY, *Holy*. See HOLY.

THURSDAY, *Maunday*. See MAUNDAY *Thursday*.

THURSIO, in *Ichthyology*, a species of fish mentioned by Pliny, lib. ix. cap. 9. It is thought by some to be the *phocæna*, or porpess; and by others the sturgeon.

THURSO, or THORSAN, in *Geography*, a market-town in the shire of Caithness, Scotland, is situated on the northern side of the coast, at the extremity of a spacious bay, on the estuary of the river Thurso, at the distance of 279 miles N. from Edinburgh. The town is irregularly built. A new town, on a regular plan, has been lately commenced at Thurso, in consequence of which, the inclosed lands let for five guineas *per acre per annum*. Here is a fine bay or harbour, which is progressively much improved in convenience and security. Eight vessels belong to the town, and are chiefly employed in conveying salmon to London. Although the customs of this port are very inconsiderable, yet the following officers are regularly stationed here; a collector, comptroller, land-surveyor, land-waiter, two established tidesmen, and one extraordinary tidesman. Thurso is a borough of barony, holding of sir John Sinclair as immediate superior. The charter of erection was granted by Charles I. in 1633, in favour of John Maister, of Berriedale, by which it was entitled "to all the privileges, immunities, and jurisdictions, belonging to a free borough of barony in Scotland." It is governed by two baillies and twelve counsellors, who are appointed by the superior, and hold their offices during his pleasure. A well-supplied market is held on Fridays; and here are two annual fairs, one of which continues for ten days. The principal manufacture of the town is coarse linen cloth: in the neighbourhood are a bleach-field and a tannery, both of which are prosperous. In the population return of the year 1811, the town and parish of Thurso were estimated to contain 592 houses, inhabited by 3462 persons. The parish extends about three miles from the town in every direction, except to the north-west, where it is bounded by the sea. The rocks that bound the coast exhibit various scenes of natural grandeur. The Clett is an insulated rock about 160 yards long and 80 broad; it is elevated about 400 feet above the surface of the sea; and during the spring season, is frequented by innumerable flocks of sea-fowls.

Thurso East, anciently called Thurso Castle, once the residence of the earls of Caithness, is now the seat of sir John Sinclair, bart. a native of Thurso; a gentleman whose exertions will ever be revered by men of science for "The Statistical Account of Scotland." In the park are the ruins of a small chapel, where earl Harold the younger was buried, and where a neat modern monument has been erected by the above-mentioned baronet.—*Beauties of Scotland*, vol. v. *Carlisle's Topographical Dictionary of Scotland*, vol. ii.

THURSO, a river of Caithness, which runs into the sea, at the town of Thurso.

THURUS, in *Natural History*, the name of a creature described by Gesner, and some others, as a distinct species of wild bull; but the accounts of it seem either fabulous or mistaken descriptions of the wild bull.

THURY, in *Geography*, a town of France, in the department of the Yonne; 10 miles S.E. of St. Fargeau.—Also, a town of France, in the department of the Oise; 7 miles S.E. of Crespy.

THUS, a town of Persia, in the province of Khorassan; 200 miles N.N.W. of Herat.

THUS, a river of Persia, which rises near Mesghid, in Khorassan, and runs into the Caspian sea, 40 miles N.W. of Zaveh.

THUS. See FRANKINCENSE.

TIUS *Judzorum*, called also *castarilla* and *cortex eleuiberis*, in the *Materia Medica*, is the bark probably of the shrub described by Catésby, under the name of *ricinoides elæagni folio* or *ilathera*, the *croton castarilla* of Linnæus, which grows plentifully in most of the Bahama islands; thence it is brought to us in curled pieces, or rolled up into short quills, about an inch wide; covered on the outside with a rough whitish matter; and brownish within; and exhibiting, when broken, a smooth close blackish-brown surface. The bark, freed from the outer coat, has a light agreeable smell, and a moderately bitter taste, accompanied with a considerable aromatic warmth. It is easily inflammable, and yields, whilst burning, a fragrant smell, somewhat resembling that of musk. Stiffer was the first who employed this bark as a medicine in Europe; who relates that a tincture of it in alkalized vinous spirits, or in dulcified alkaline spirits, proved carminative and diuretic, and did service in arthritic and scorbutic cases. In 1694 and 1695, it was employed by Apinus in an epidemic fever of the intermitting kind. The gentlemen of the French Academy found this bark of excellent service against an epidemic dysentery in 1719, when the ipecacuanha proved ineffectual. At present it is of great esteem among the Germans, as a warm stomachic and corroborant, in flatulent colics, internal hæmorrhages, dysenteries, the diarrhœa of acute fevers, and, mixed with the Peruvian bark, in common intermittents.—Among us it has been lately received into practice; but its use, says Dr. Lewis, is not yet become so general as it well deserves to be. Its virtues are partially extracted by water, and totally by rectified spirits. Lewis's *Mat. Med.*

TIUS, in *Sea Language*, the order by which the pilot directs the helmsman to keep the ship in her present situation when sailing with a scant wind, so that she may not approach too near the direction of the wind, and thereby shiver her sails, nor fall to leeward, and run farther out of her course. Falconer. See STEERING.

THUSCUS VICUS, in *Ancient Geography*, the name of one of the seven mountains of Rome, called also Cælius Mons.

THUTHOA, a river of the Peloponnesus, in Arcadia, which discharges itself into the Ladon.

THUYA, in *Botany*. See THUJA.

THWAITE, in *Ichthyology*. See SHAD.

THWART, in a boat, the seat or bench of a boat on which the rowers sit to manage the oars. Hence *thoughts*, (which see,) is used in the same sense.

THWART *the Harwe*, in *Sea Language*. See ATHWART.

THWART *Ships*, across the ships. See ATHWART.

THWART *the Way*, in *Geography*, a small island in the Straits of Sunda. S. lat. 5° 55'. E. long. 105° 43'.—Also, a small island in a bay on the coast of New Guinea. S. lat. 2° 15'. E. long. 136° 54'.

THWARTER, TREMBLING, or *Leaping-Ill*, a disease in sheep, of the shaking, jumping, and convulsive kind. These different terms, some of which were formerly particularly used in one part and another in another, especially in the northern districts of the kingdom, are now said to be had recourse to indifferently, and applied indiscriminately to all diseases which, on a dry soil, proceed from a weak and enfeebled state of body and barren seasons. Under this threefold name, some say they have seen sheep suffering by diseases, which at least had much resemblance to those of several other sorts, as the apoplectic, paralytic, rheumatic, &c.; and that even when an old sheep falls down, and dies of weakness and exhaustion, the manner of its death differing somewhat from that of the hog-sheep, it is frequently ascribed by shepherds to the thwarter or trembling-ill.

There is, on the whole, so much contrariety of opinion, and diversity in the descriptions of the disease, its causes, and the means of cure, that the writer of a paper on some of the diseases of sheep, in the third volume of the "Transactions of the Highland Society of Scotland," has divided and considered it under two distinct species.

The *first* variety, it is said, is much more rare than formerly, and is scarcely known in the Highlands of the above country. It appears mostly in the spring and harvest seasons. It affects sheep of all ages and kinds, but never when in good condition, existing chiefly on dry farms, which have a northern exposure, and which are evidently overstocked; but on these only when the spring is severe and dry, or when early April grafs has been cut down by frosts, and the sheep can find no succulent food or any thing green. Its production is favoured by a long continuance of easterly winds; and in cold weather, ewes are sometimes attacked by it, even after they are fleeced. In these circumstances they become extremely emaciated, especially when heavy with lamb in many of them, or giving suck; and when at this time they get an overstretch in running or leaping, or even an halty start, or crush in the fold, numbers fall a prey to this disorder.

The appearances are, that some sheep, it is said, will fall down and die in two or three minutes; others will lose the power of one side, and lie sprawling until they die of hunger; others again will lie shivering, and very sick at times, until death also comes on; and some will go a long time quite lame, until they are likewise quite exhausted. Others describe it as of two kinds; in one, sometimes seizing the whole system, when there is a general trembling over the whole body, and in the other, sometimes affecting the legs only, when the animal immediately falls down, and the shaking, which is uninterrupted, is confined to the legs. Some say that the animal gradually loses the power of its legs and body, until it becomes quite weak, always lying at last upon one side. Those sheep which die of it in spring, are lean and useless; but the mutton of fat hog-sheep carried off by it in the autumn is not uneatable. It is sometimes extremely fatal. In one instance, out of a flock of forty score, seventeen score were, it is stated, lost in one spring. It was formerly thought to be contagious, and although this can scarcely be the case, it is certainly most destructive when it first comes among a flock; and when sheep are brought from a clean ground to one infected with it, great numbers of them are sure of dying. Those which survive it one season, are sure to relapse the next spring.

Udder-locking should be entirely laid aside, as in one instance, one-twentieth of a large parcel of ewes is said to have died of the disease, in the course of a week after they had been udder-locked. See *UDDER-LOCKING*.

It is also said to be useful during the early spring months to provide them with sufficient food and shelter; and to avoid overstocking, if the early grafs has been blighted, to pasture them in a rich park or other ground, on water-meadow, or on moss and early rye-grafs.

The *second* variety of the disease is, it is remarked, chiefly confined, in the above part of the kingdom, to the flocks in the south of it, more especially about the banks of the river Tweed, and of those which discharge themselves into it. It is said to be a complaint almost unknown to the farmers on the Pentland range, and to the north of the Forth. In those places where it prevails, it is sometimes peculiarly fatal, and a farmer often loses more of the flock by it alone, than all the other diseases put together.

The appearances when it first comes on, which is generally during the summer or harvest months, are, that the

animal turns somewhat stupid and neglects its food, dozes round, in some measure, as in the sturdy, and frequently leaps up, as if to clear any bush or dike before it; at times, it will eat voraciously, and again refuse all sustenance for a considerable time. It continues frequently leaping during the day, and the neck is often stiff, and turned on one side; convulsions take place in the limbs which cause the animal to fall down, make curious contortions, and at times run to a little distance; the body sometimes partakes of these, when the sheep becomes totally incapable of motion, and dies from want of food, which the jaws will not open to admit, being closely wedged together. In this state, it is unable to follow the flock, and the wool claps to the body. It lies for a long time motionless, and at length dies. After lying motionless for a considerable time, in those cases where the disease is not so violent, and the spasm of the jaw not so severe, it gradually relaxes, and the sheep will eat the whole of the food within reach quite bare, although the power of the limbs is totally gone, leaving the earth quite red and naked all round them. If the shepherd be attentive, and lifts them from place to place, and the season be pretty well advanced, they often slowly recover, and are again restored to the use of their limbs. When they lie in this inactive state, if the weather be warm, maggots are very apt to breed in them; and if not attended to, soon destroy them.

The disease mostly appears at the periods stated above, especially during hot and sultry weather, and arises either from the sheep being put into violent motion by dogs, or overheated by the sun; in which cases, in a few hours afterwards, it makes its appearance by the stiff neck, or some of the other signs coming on. When the sheep are exposed to fatigue, it will take place, if the weather be warm, independent of violent motion. They are commonly the *fattest* of the flock that are cut off by it. It not unfrequently arises from the braxy, of which it is mostly a favourable sign. It is never severe, however, when it is the consequence of that disease, and the stiff neck never accompanies it.

In regard to the means of cure in the *first* sort, they are various. When the sheep fall down suddenly, and are threatened with immediate death, bleeding, by cutting the tail, or opening a vein on the inside of the fore-thigh, will sometimes give instantaneous relief. In all the other cases it is proper to take them home and feed them with strengthening food; and if at this time they be attacked with a temporary scouring, they mostly recover very fast, and soon acquire their former vigour. It is said that some few means of cure are occasionally tried, but it is believed with little success. Dipping in cold water is not unfrequently practised; whisky and gunpowder are sometimes poured down their throats; and balls of mustard and other hot pungent medicines are often administered. Others recommend bringing them into the house, giving them a mixture of equal quantities of fallad oil and spirits, with a little finely powdered ginger, and at the same time rubbing into the back a little black soap broken in warm water, and feeding them on hay, the produce of dry walks or other grounds.

The giving of the sheep a decoction of the dewcup and healing leaf boiled in butter-milk, is said to have been uniformly successful in treating sheep affected with this disorder during the summer and autumn.

In the removal of the *second* kind of the disease, as it arises from the brain being oppressed, by too much blood being sent to it by the quickened circulation, the first thing to be attended to on its appearance is copious blood-letting,

which will be more effectual if taken from the veins of the neck, or from a vein on the outside of the eye, mostly well known to shepherds. It may even be taken from the tail, or fore-leg; but opening of the veins of the head is generally considered as the most proper and beneficial in this species of the complaint. As there is too great a determination of blood to the head, it will be attended with advantage to make a determination to the bowels, by stimulating them by means of purgatives, such as those of common salts, one ounce or more; calomel, from ten grains to half a drachm; or, what is supposed more proper, as it also acts upon the kidneys and skin, a dose of half an ounce or more of nitre. These remedies are to be persevered in, until all marks of the disease disappear. But if the sheep be too far gone in the disorder, and has lost all motion, it should be killed for the sake of the carcase, which in this species of the disease is not affected, or at least but very slightly.

In the managing of the cure, much nice attention is necessary in both kinds of this disease.

THY, in *Geography*, a town of Prussia, in Pomerelia; 7 miles N. of Marienburg.

THYAMIA, in *Ancient Geography*, a town of the Peloponnesus, in Sicyonia. Xenophon.

THYAMIS, a town of Arachosia, founded by Semiramis.—Also, a promontory of Epirus, between Thesprotia and Cestrinia.

THYARIS, a river of Asia, in Phrygia Salutaris, which passed through the northern part of this province, and discharged itself into the Sangara.

THYATIRA, AKHISAR, a town of Asia Minor, in Lydia. According to Steph. Byz. it was very ancient, and called Pelope, Pelopea, or Pelopia, and afterwards Semiramis. According to Pliny it was also denominated Evippa. It derived its name of Thyatira, from the Greek word signifying daughter, from Seleucus Nicanor, who received the news, as it is said, at this town of the birth of a daughter. From an inscription found in this city, it appears that Adrian had a temple in it; and medals have been found here that were struck in honour of Adrian. Strabo says that the town of Thyatira was considered by some authors as the last of the district of Mysia, and that it was a colony of Macedonians. After Scipio had defeated Antiochus near Magnesia of Sipyla, the town of Thyatira sent ambassadors to the Romans, to render them homage. Thyatira was taken by Aristonicus, in the year 130 B.C.; but this prince having been taken prisoner in the same year by the consul Perpenna, this town reverted to the dominion of the Romans. Thyatira was much distinguished by the benefactions of the emperor Caracalla; and it appears by a medal of this town; that under the reign of this prince it took the name of Neocorus. This place was one of the seven churches of Asia, mentioned in the book of Revelations; so that the Christian religion was introduced here by the apostles and their immediate disciples; but whether the church was founded by St. Paul or St. John, or by either of them, does not appear.

The inhabitants of Thyatira had a particular veneration for Diana. This appears from many inscriptions found in the town, on one of which this goddess bears the title of "Diana Montana." The town was situated at the southern foot of a chain of mountains, on the route from Pergamus to Sardis, and it was watered by a stream of the river Caicus. The town suffered much by an earthquake in the reign of Tiberius. See AKHISAR.

THYIA, *Θυια*, in *Antiquity*, a festival in honour of Bacchus, celebrated by the Eleans.

THYITES LAPIS, in the *Materia Medica of the Ancients*, the name of an indurated clay, approaching to the

nature of a stone. It was found in Egypt, and used in different temperatures of the eyes.

This substance has been very much misunderstood by late writers, and by most of them supposed to be lost at this time; but this was wholly owing to their mistaking the class of bodies among which they were to look for it: some imagining it to have been a species of green marble; and others the turquoise-stone, that Dioscorides meant by this name. It is very plain, however, that it was no other than an indurated clay of the morochthus kind, and no more a stone than that substance, that being also frequently called *lapis morochthus*.

It is of a smooth, even, and regular texture, very heavy, of a shining surface, and of a pale green, without the admixture of any other colour. It does not at all adhere to the tongue, nor stain the fingers in handling; but drawn along a rough surface, leaves a slender white line. It melts slowly in the mouth, and is of a sharp, acrid, and disagreeable taste; and when rubbed down with water on a marble, it melts into a milky liquor of a pure white, not the least greenness being sensible in it. It is found at present in the great mine at Goslar in Saxony, and seems to owe its colour to particles of copper, to which also it owes the virtues attributed to it by Dioscorides, acting as a weak kind of verdigris. Hill.

THYLACION, a word used by the ancient medical writers, to express the bag formed by the membranes of the fœtus at the orifice of the pudenda, before the birth.

THYLLA, *Θυλλα*, in *Antiquity*, a festival in honour of Venus.

THYMALLUS, in *Ichthyology*. See GRAYLING, and SALMO *Thymallus*.

THYMATERIUM, in *Ancient Geography*, a town of Africa, in Libya, two days' journey beyond the columns of Hercules, according to the Periplus of Hannon: it is the Thymateria of Steph. Byz.

THYMBRA, a town of Asia Minor, in the Troade, according to Steph. Byz. who says that it was founded by Dardanus, who gave it its name after that of his friend Thymbros. Apollo had a temple here under the appellation of Thymbrian. Strabo says that a stream called Tymbrus traversed its canton, and that this stream discharged itself into the Scamander, before the temple of Apollo. Servius says that Achilles was wounded here by Paris; and this circumstance gave occasion to the report that the wound was inflicted by Apollo.

THYMBRA, or *Tymbra*, a mountain of Asia, in Phrygia.

THYMBRA, in *Botany*, a name borrowed from Dioscorides, whose real *θυμβρα*, however, is a species of SATUREIA; see that article, n. 3. Linnæus therefore has adopted the above name for another Greek genus, nearly akin to the original plant.—Linn. Gen. 288. Schreb. 385. Willd. Sp. Pl. v. 3. 46. Mart. Mill. Dict. v. 4. Ait. Hort. Kew. v. 3. 375. Sm. Prod. Fl. Græc. Sibth. v. 1. 398. Juss. 115. Lamarck Illustr. t. 512.—Class and order, *Dinymnia Gymnospermia*. Nat. Ord. *Verticillata*, Linn. *Labiata*, Juss.

Gen. Ch. *Cal.* Perianth inferior, of one leaf, nearly cylindrical, with a longitudinal hairy keel at each side, the orifice two-lipped; upper lip broadest, cut half way down into three equal converging segments; lower in two deep narrower segments. *Cor.* of one petal, ringent; tube nearly cylindrical; upper lip flat, erect, cloven, obtuse; lower in three, nearly equal, flat lobes. *Stam.* Filaments four, thread-shaped, approaching each other in pairs, two of them shorter than the rest; anthers of two divaricated lobes, under the upper lip of the corolla. *Pist.* Germen superior, four-cleft;

clef; style thread-shaped, cloven a little way down; stigmas two, acute. *Peric.* none, except the unaltered calyx. *Seeds* four.

Ess. Ch. Calyx nearly cylindrical, two-lipped, marked on each side with a hairy prominent line. Style cloven.

1. *Th. spicata*. Spike-flowered Thymbra. Linn. Sp. Pl. 795. Willd. n. 1. Ait. n. 1. Sm. Fl. Græc. Sibth. t. 546, unpublished. (*Th. spicata* verior hispanica; Barrel. Ic. t. 1230. *Thymum majus longifolium*, &c.; Pluk. Phyt. t. 116. f. 5.)—Flowers spiked. Leaves lanceolate.—Native of the Levant, on dry hills. Dr. Sibthorp met with the plant in Crete, Asia Minor, and Greece, and conceived it to be the *ὑσσώπος ορεινός*, or Mountain Hyssop, of Dioscorides, which is extremely probable. The *stem* is shrubby, very bushy, about a foot high, with numerous, upright, simple, leafy, purplish, quadrangular branches, whose opposite sides are often densely downy, in an alternate manner between the different pairs of leaves, the pubescence recurved. *Leaves* opposite, sessile, crowded, spreading, acute, entire, about an inch long, smooth on each side, besprinkled with resinous dots, and fringed at the margin with copious white hairs. They are accompanied by axillary tufts of smaller and narrower leaves. *Flowers* of a fine reddish purple, in solitary, terminal, dense, leafy, whorled spikes, from two to four inches long. *Calyx* reddish, abounding in essential oil, smooth and naked, without ribs, except the lateral line at each side, which is fringed, as well as the teeth, with strong white hairs. *Bractæas* lanceolate, fringed, purplish. Tube of the *corolla* twice the length of the calyx, somewhat downy; lower lip deflexed, in three obtuse equal segments, hairy about the throat. The whole herb has the warm pungent flavour of Thyme, and the aspect of Hyssop.

2. *Th. verticillata*. Whorl-flowered Thymbra. Linn. Sp. Pl. 796. Willd. n. 2. Ait. n. 2. (*Hyssopus montana*; Dalech. Hist. 934; not 394, as Willdenow, copying Linnæus's typographical error, has it.)—Flowers whorled. Leaves linear-lanceolate.—Native of the south of Europe. The *stem* is shrubby, but more slender than the last, hairy in the same manner, but more universally. *Leaves* much narrower, dotted and fringed in the same manner. *Flowers* axillary, from top to bottom of each branch; those of the principal one six in each whorl; those of the lateral branches only two. In structure, size and colour they agree with the foregoing, only the *calyx* has some appearance in the dried specimen of being more ribbed. Its lateral keels, as well as the teeth, are strongly fringed. Nevertheless, the general hue and aspect of these two plants are so much alike, that there seems great reason for Linnæus's suspicion of their being varieties of each other. At the back of the original specimen of this last is the following synonym. *Tragoriganum creticum, majore crassiore asperiori folio*; Prosp. Alpin. Exot. 79. So confused is this old author, that one can hardly tell which of his plates his loose descriptions refer to; but our plant certainly agrees better with his *Thymbra*, t. 80, than with his *Tragoriganum*, t. 78, though the above synonym seems to indicate the latter.

3. *Th. ciliata*. Capitata-flowered Thymbra. Desfont. Atlant. v. 2. 10. t. 122. Willd. n. 3.—Flowers capitata. Leaves linear. *Bractæas* ovate.—Found by Desfontaines, on dry hills and uncultivated spots, near Mascara, in Algiers. A small bushy *shrub*, from eight to twelve inches high, agreeing much in habit with the two preceding species; but the *leaves* are linear; while the *bractæas* are broader and more ovate, as well as the *spikes* much shorter, than in the *Th. spicata*. The *leaves* are equally fringed in all. Nothing is laid, or expressed in the figure, of any hairy lateral lines on

the *calyx*, the most important character of *Thymbra*. Having seen no specimen of this species, we cannot judge with certainty respecting its genus, nor whether it might not rather be referred to SATUREIA, see that article; but we cannot satisfactorily assent to the opinion of its learned discoverer, that these genera are not sufficiently distinct. The *calyx* in the natural order to which they belong affords, in many instances, clear, though nice, generic differences. At the same time we admit that Linnæus is incorrect in making a femibifid style, by which must be understood a style cloven half way down, one of the essential marks of a *Thymbra*.

THYMBRA, in *Gardening*, furnishes plants of the under shrubby, exotic kind, among which the species cultivated are the spiked thymbra (*T. spicata*); and the whorled thymbra (*T. verticillata*).

Method of Culture.—These plants may be increased by seeds, slips, and cuttings. The seeds should be sown in the early spring in a warm border, and sheltered from bad weather by glasses; or, which is better, in pots filled with light mould, and placed in a mild hot-bed: when the plants have attained some growth, they should be set out or removed into separate pots.

The slips and cuttings should be planted out in the spring and summer, and when well rooted, removed where they are to grow: they also sometimes succeed by bottom offsets, planted out as above.

They afford variety among other potted greenhouse plants; and require the protection of such houses during the winter season, in this climate, in almost all situations and places.

THYMBRÆUS MONS, in *Ancient Geography*, a mountain of Asia Minor, in the Troade; from which, according to Festus, Apollo was denominated Thymbrian.

THYMBRIA, a place of Ionia, four stadia E.S.E. of Myus. The cavern Charonium was near Tymbria, which was thought to be one of the mouths of Hell, because from it issued pestilential vapours.

THYMBRIUM, a town of Asia, in Phrygia, at the distance of twelve parasangas from Caystropedium. At this place was a fountain, called the fountain of Midas, king of Phrygia.

THYME, in *Botany*. See THYMUS.

In the *Materia Medica*, the common garden thyme is a moderately warm pungent aromatic. To water it imparts by infusion its agreeable smell, with a weak taste and yellowish or brown colour; in distillation, it gives over an essential oil, in the quantity of about an ounce from thirty pounds of the herb in flower, of a gold yellow colour if distilled by a gentle fire, of a deep brownish-red if by a strong one, of a penetrating smell like that of the thyme itself, but less grateful, and in taste exceedingly hot and fiery: the remaining decoction, inspissated, leaves a bitterish, roughish, subsaline extract. The active matter, which by water is only partially dissolved, is by rectified spirit dissolved completely, though the tincture discovers less of the smell of thyme than the watery infusion; and the spirit brings over, in distillation, a part of its flavour, leaving an extract of a weak smell, and of a penetrating camphorated pungency. Murray has observed, that this plant seems actually to contain a species of camphor.

The virtues of thyme, according to Bergius, are resolvent, emmenagogue, diuretic, tonic, and stomachic. As agreeing, says Woodville, in common with the natural order of verticillatæ, its aromatic qualities may be found equally useful in some of those complaints for which lavender, sage, rosemary, &c. are usually employed.

The *serpyllum*, or mother of thyme, is an elegant aromatic plant,

plant, similar to the preceding species, but milder, and in flavour rather more grateful; its essential oil is both in smaller quantity and less acrid, and its spirituous extract comes greatly short of the penetrating warmth and pungency of that of the others, so that it is less medicinal than the other species. It is said to afford an agreeable distilled water, more durable, but less active and penetrating than peppermint. (Lewis.) This has been much extolled as a nervous simple. An infusion of it has been said to do wonders in tumours, lowness of spirits, and head-aches: and it has been much commended for the cure of the night-mare.

The *lemon-thyme*, which is a variety of the last, is less pungent than the first sort, but more so than the second, and much more grateful than either. Distilled with water, it yields a larger quantity than the other sorts, of a yellowish very fragrant oil of the lemon-flavour, containing nearly all the medicinal parts of the plant. It gives over also, with rectified spirit, its finer odorous matter. Lewis.

THYME, *Cat.* See *TEUCRIUM Marum*.

THYME, *Mastich.* See *THYMUS Mastichina*.

THYMELÆA, in *Botany*, from *θυμος*, *thyme*, and *ελαια*, *an olive*, (the first alluding to the leaf, and the latter to the shape and oiliness of the fruit,) is an ancient Greek name, found in Dioscorides, book 4. chap. 173. His *θυμηλαια*, there described, is thought to be the *Daphne Gnidium* of Linnæus; and must be at least one of that natural order, and, probably, genus. Hence the name has been applied by many botanists, amongst which were the Bauhins and Tournefort, to what Linnæus called *DAPHNE*; see that article. This latter appellation was preferred by him and his school, because a name composed of another, already established; is contrary to a very sound law of the *Philosophia Botanica*; and in the present instance the word is compounded of two other generic names, though one of them has been made Latin in *Olea*. The French however still hanker after *Thymelea*, as appears by Jussieu's choosing it for the title of one of his Orders. See *THYMELÆÆ*.

THYMELÆÆ, the twenty-fifth of Jussieu's Natural Orders, or the second of his sixth class, thus named from an ancient synonym of the genus *Daphne*, which makes a principal figure herein. (See *DAPHNE* and *THYMELÆA*.) This order is analogous to the *Vepreculæ* of Linnæus. For the detailed characters of Jussieu's sixth class, see *LAURI*. The order of *Thymelææ* is defined as follows.

Calyx of one leaf, tubular, inferior. *Corolla* none; but in some instances there are petal-like scales, originating from the mouth of the calyx, which have the appearance of a polypetalous corolla. *Stamens* definite, inserted into the calyx, and for the most part double the number of its segments, some being opposite, others alternate therewith. *Germen* superior, simple; style solitary; stigma mostly undivided. *Seed* solitary, superior, either naked, or pulpy, or clothed with the calyx. *Embryo* destitute of albumen; its radicle superior. *Stem* mostly shrubby. *Leaves* generally alternate.

We may add to these characters of Jussieu the remarkable silky appearance of the inner bark, when a twig is broken. Mr. Brown, *Prodr. Nov. Holl.* v. 1. 358, observes that the general number of *flamens* is eight, sometimes four, rarely but two; in the latter cases always opposite to the segments of the *calyx*, which are occasionally five, sometimes, not always, with ten *flamens*. The same writer informs us there is sometimes a slight portion of *albumen*. The *leaves* are entire, destitute of *stipulas*. *Flowers* capitate or spiked, terminal or axillary, sometimes solitary.

The genera, as they stand in Jussieu, are *Dirca*; *Lagetta*, Lamarek Illustr. t. 289; *Casijera*, Juss. append. 448;

Daphne; *Passerina*; *Stellera*; *Struthiola*; *Lachnea*; *Dais*; *Gnidia*; *Nesandra* of Bergius, included under *Gnidia* by Linnæus; and *Quisqualis*. To these is to be added the great diandrous genus of *Pimelea*, of which Mr. Brown defines thirty-four New Holland species.

The order under consideration is one of those which has most excited the question of what is a *calyx*? and what a *corolla*? and is appealed to equally by those who maintain different theories on this intricate subject. It seems to us that the *Thymelææ* combine both those parts in one, the coloured inside of their *calyx* having exactly the nature of a *corolla*; which is confirmed by the remark of Jussieu, that the tube of *Daphne Mezereum* is double, formed of two layers. The appendages, in the form of scales, or glands, found in *Gnidia* and *Struthiola*, are more evidently *petals*, and would doubtless be universally taken for such, did not analogy and theory cast a doubt over the subject. At any rate it is safe to say that *Daphne* has a coloured *calyx*, as well as most of its allies; just like *Polygonum*, in the generally colourless order of *Holeraceæ*, or *Atriplices*.

THYMELÆÆ *Radix*, in the *Materia Medica*, the dried root of the *thymelæa foliis lini* of Tournefort and other authors.

It is a light root of different sizes, of a reddish colour without, and greyish within, woody, and full of fibres, and tastes sweet at first, but is hot as fire when it has been held a little time in the mouth. It loses however both this fiery taste, and its acrid quality, in long keeping, and with them its virtues.

It is to be chosen new, well fed, and not worm-eaten. The fruit of this plant is the *granum cnidium* of the shops. They are both of an acrid quality, and are not in use in the shops at present.

THYMELE, in *Biography*, a celebrated female Grecian, who invented theatrical dances. It is supposed that the Greeks called their comedians *Thymelici* from her name.

THYMELE, in the *Ancient Theatre*, a kind of pulpit, where the singers, called *thymelici*, performed.

THYMELICI, among the Romans, were musicians, who sung in the interludes, or who danced and kept time with their gestures. The place where they performed was called *thymelc*, whence Juvenal, vi. 66.

“Attendit thymele, thymele nunc rustica discat.”

THYMIAMA, *θυμιαμα*, in *Antiquity*, an offering of incense to God.

THYMIAMA, in the *Materia Medica*, a name by which some authors have called the *casjarilla bark*; called by some *cortex thuris*, or Indian bark. (See *THUS Judæorum*.) The *cortex thymiamatis* of the German shops is a bark, in small brownish-grey pieces, intermixed with bits of leaves, brought from Syria, Cilicia, &c. and supposed to be the produce of the liquid storax-tree. It has an agreeable balsamic smell, approaching to that of liquid storax, and a subacid bitterish taste accompanied with some slight astringency. Cartheuser and Hoffman report, that it affords an excellent fumigation for oedemas, rheumatisms, and catarrhs; and that the spirituous tincture and extract, and the distilled spirit, are useful anodynes or antispasmodics in convulsive coughs and other disorders. It is rarely met with in this country. Lewis.

THYMIAMATA, a kind of fumigations among the ancients, the ingredients of which were so various, that it appears they always consulted utility as well as pleasure, in their composition of them.

We find the gum ammoniacum of the ancients, which had the smell of castor, used in them: whence it is evident, that

that the ancients used salutariferous as well as sweet-scented things in these fumigations. Galbanum has a worse smell than ammoniacum, and yet this also we find, together with the myrrh, and other gums, is made an ingredient in the oldest prescriptions of this kind.—And Pliny mentions the ammoniacum with the schœnanth, and other sweets, used for this purpose.

THYMIATUM, in *Ancient Geography*, a country of Africa, in Libya, on the coast of the Atlantic, according to the Periplus of Hannon.

THYMIC, in *Anatomy*, arteries, veins, &c. belonging to the *thymus*; see that article.

THYMIUM, a wart or excrescence on the skin.

THYMNIA, in *Ancient Geography*, a gulf placed by Pliny on the coast of the Doride, a province of Asia Minor. Here was a promontory of the same name.

THYMOXALMÉ, in the *Materia Medica of the Ancients*, was a composition used externally in the gout, and many disorders of the limbs, and was given inwardly in distemperatures of the stomach, a quarter of a pint for a dose. It operated as a purge, and was prepared in the following manner: take two ounces of bruised thyme, as much salt, a little meal, rue, and pennyroyal.—These were to be put into a pot, and three pints of water and fourteen ounces of vinegar are to be poured upon them; after which they are to be covered with a coarse cloth, and set in the sun for some time. Dioscorides, lib. v. cap. 24.

THYMUS, in *Anatomy*, a glandular body, occupying the upper and anterior part of the chest, and neighbouring portion of the neck, very large in the fœtus, and diminished or nearly disappearing in the adult. The name is Greek, *θυμος*, which Pollux defines “*caro similis tonsillæ, prope cordis caput*,” p. 258. The gland consists of two lobes, a right and left, which are elongated and conical, being broader below and narrow above: they are joined by cellular substance, which can easily be destroyed by dissection, in their inferior two-thirds, but above they are separated by the intervention of the trachea. The thymus, indeed, may be described as forming two elongated horns above, of which the right is sometimes longer than the left: it also forms two horns below; but they are shorter, thicker, and more obtuse. The principal body of the gland occupies the cavity of the mediastinum, or the interval between the right and left pleuræ, behind the upper part of the sternum. Here it is covered in front by that bone, on the sides by the pleuræ, and it rests behind on the front of the pericardium, of the aorta at its origin, and of the left subclavian vein. The inferior cornua reach to about the middle of the pericardium; and sometimes nearly to the diaphragm: the superior run into the neck, on each side of the trachea, between that tube and the carotid, and reach the thyroid gland, or nearly so.

The thymus is large in the fœtus; nearly equal to the heart or one of the lungs. In a fœtus of six months, this gland was to the kidney as 4 to 6. It not only does not increase after birth, but it becomes less, contains less fluid, is harder, and is nearly lost in the surrounding fat. In the mature fetus it weighed 160 and 180 grains; at twenty-eight years, 90 grains. In a calf it was 16 ounces; in a full-grown cow, 9 ounces.

In structure it resembles the conglomerate glands: that is, it is composed of innumerable small portions, united by cellular substance. By maceration these may be separated into smaller and smaller lobules. It is however softer than the pancreas or salivary glands, and of a darker colour. When cut into, a copious whitish fluid may be squeezed out from all parts of its texture. If air be impelled into it, the whole is reduced into a spongy kind of substance.

No excretory duct has been discovered in the thymus; although anatomists have fancied that they had discovered passages from it to the œsophagus, trachea, pericardium, &c.

It has several arteries and veins: the former principally from the thyroid and mammary. The veins join the left subclavian, or the jugular, and the internal mammary.

The nerves, if it has any, are extremely small twigs from the phrenic. Its absorbing vessels, which no doubt exist, are not much known.

It is of considerable size, even in the adult, in some animals, as the rat: the same may be observed of the Arctic bear. It is large in fetaceous animals.

We know nothing of its office, nor why it is so large in the fœtus. There is not even a probable conjecture on the subject.

THYMUS, a warty excrescence, especially about the anus or pudenda.

THYMUS, in *Botany*, *Thyme*; *θύμος* of the Greeks, whether so called from *θυμός*, *courage*, in allusion to its cordial qualities; or from *θυω*, *to glow or burn*; or *to sacrifice*, because it may have been used in sacrificick garlands; we must leave to every one's opinion. The last explanation appears the least satisfactory.—Linn. Gen. 297. Schreb. 394. Willd. Sp. Pl. v. 3. 138. Mart. Mill. Dict. v. 4. Art. Hort. Kew. v. 3. 413. Sm. Fl. Brit. 639. Prodr. Fl. Græc. Sibth. v. 1. 419. Pursh 413. Juss. 115. Tourn. t. 93. Lamarck Illustr. t. 512.—Class and order, *Didynamia Gymnospermia*. Nat. Ord. *Verticillatæ*, Linn. *Labiatæ*, Juss.

Gen. Ch. *Cal.* Perianth inferior, of one leaf, tubular, permanent, divided nearly half way down into two lips, the mouth closed with converging hairs; upper lip broadest, flat, erect, with three teeth; lower of two equal awl-shaped segments. *Cor.* of one petal, ringent; tube the length of the calyx, with a small throat; upper lip rather the shortest, flat, erect, emarginate, obtuse; lower longer and broader, spreading, in three obtuse lobes, of which the middle one is the broadest. *Stam.* Filaments four, incurved, two longer than the rest; anthers small, two-lobed. *Pist.* Germen superior, deeply four-cleft; style thread-shaped; stigma divided, acute. *Peric.* none, the seeds being concealed in the calyx, whose orifice is contracted and hairy. *Seeds*: four, small, roundish.

Ess. Ch. Calyx two-lipped, its mouth closed with hair. Upper lip of the corolla flat, emarginate.

The trifling genera of old authors, made out of the present, though indicated by Linnæus, are not worth considering. It is more desirable to define the limits of *Thymus* itself, which run very close upon those of *MELISSA*; see that article, at the end of which this subject is discussed. The number of species in Syft. Veg. ed. 14. are eleven; Willdenow has 22. We shall find some things among them to correct, and several new species to add. The habit of the whole is more or less shrubby, but their stature humble, with spreading or diffuse branches. *Root* woody, generally perennial. *Branches* square. *Leaves* opposite, mostly entire. *Flowers* either whorled or capitate, purple or lilac, sometimes nearly white; never really blue, scarlet or yellow. Whole plant abounding with pungent aromatic essential oil. This genus is almost entirely European, and inhabits dry hilly situations, in the warmer or more temperate climes.

1. *Th. Serpyllum*. Wild Thyme, or Mother of Thyme. Linn. Sp. Pl. 825. Willd. n. 1. Fl. Brit. n. 1. Engl. Bot. t. 1514. Curt. Lond. fasc. 2. t. 47. Woodv. Med. Bot. t. 110. (*Serpyllum*; Rivin. Monop. Irr. t. 42. *S. vulgare*; Ger. Em. 570. Dod. Pempt. 277. Vaill. Paris. t. 32. f. 9, as well as the varieties 6, 7 and 8.)

THYMUS.

β. *Serpyllum citratum*; Ger. Em. 571. Rivin. Monop. Irr. t. 41. Lemon Thyme.

γ. *Thymus lanuginosus*; Willd. n. 2. (*Th. Serpyllum* δ; Linn. Sp. Pl. 825. *Th. pannonicus*; Allion. Pedem. v. 1. 20. *Th. n. 236*. Hall. Hist. v. 1. 103. *Serpyllum montanum hirsutum*; Rivin. Monop. Irr. t. 42.) Hoary Mother of Thyme.

Flowers capitate. Stems decumbent, creeping. Leaves flat, ovate, obtuse; fringed at the base.—Native of dry heaths and hillocks, as well as alpine pastures, throughout Europe, from Sweden to Greece, flowering all summer long. Its entangled branches form an elastic perennial turf, exhaling a warm aromatic odour when trodden upon, which varies in degree, and, in the well-known variety β, assumes the grateful flavour of lemon-peel. The hoary or woolly variety we believe to be no more specifically distinct, notwithstanding Willdenow's remark, of its being unchanged by culture; for he does not mention having raised it from seed. The stems of *Th. Serpyllum* are wiry and slender, always wavy, never straight; their branches leafy and downy, ascending, each terminating in a little round head of numerous purple flowers, whose palate is variegated with white and crimson. Leaves dotted, strongly fringed at the base, as are their footstalks throughout. *Stipulas* none. Bees frequent the flowers in great numbers. Hairy swellings, caused by an insect, are common on the young shoots. The seeds are rarely perfected.

2. *Th. levigatus*. Smooth Arabian Thyme. Vahl. Symb. v. 2. 65. Willd. n. 3. (*Th. Serpyllum*; Forsk. Ægypt.-Arab. 107.)—"Flowers capitate. Stems procumbent. Leaves linear, obtuse, sessile; contracted at the base."—Found by Forskall, on mount Chadra, in Arabia Felix. Stems shrubby, thread-shaped; smooth in the lower part, villous above, grey, with jointed annulated branches. Leaves half as long as the nail, very smooth, without ribs, dotted on both sides; fringed at the base. Head of flowers sessile, terminal, hemispherical, surrounded with numerous larger leaves. Calyx marked with elevated hairy lines; its teeth awl-shaped, fringed. Corolla rather hairy. Vahl.

3. *Th. montana*. Smooth Mountain Thyme. Waldst. et Kitaib. Hungar. v. 1. 72. t. 71. Willd. n. 13, excluding the rest of the synonyms, which belong to our *Th. Serpyllum*, var. γ. Ait. n. 7.—Flowers in elongated heads. Stem erect, branched. Leaves ovate, obtuse, flat, smooth and naked, entire.—Native of the Carpathian mountains. We received it from the Cambridge garden, in 1803. The root is perennial, with many long branching fibres. Stem a span high, bushy; the angles downy, with fine recurved hairs. Leaves stalked, broadly ovate, slightly revolute; very smooth and even above; destitute of fringe at the base. Inflorescence like *Th. Serpyllum*, but rather more elongated, or spiked, and the flowers smaller, with a much less hairy, though not smooth, calyx, the hairs of whose orifice are scarcely prominent at all, by no means so conspicuous as in the *Serpyllum*.

4. *Th. nummularius*. Money-wort Thyme. Marfch. a Bieberst. Taur. v. 2. 58.—Flowers capitate. Stems decumbent, creeping, hairy. Leaves roundish-ovate, flat, obtuse; somewhat fringed at the base and midrib.—Native of mount Caucasus. We received wild specimens from Dr. Fischer. This has a very different aspect from *Th. Serpyllum*, on account of its almost orbicular leaves, and the hemispherical leafy heads of flowers. Every part moreover is three or four times the size of that common species. The joints of the stem are remarkably villous in their upper part, especially near the flowers. Sometimes, it is said, the whole plant is densely hairy.

5. *Th. Marschallianus*. Bushy Taurian Thyme. Willd.

n. 8. Marfch. a Bieberst. Taur. v. 2. 59.—Flowers in elongated heads. Stem shrubby; its flowering branches erect. Leaves linear-lanceolate, bluntnish, flat, somewhat triple-ribbed; fringed at the base. Frequent in dry grassy hilly places, about mount Caucasus, flowering from May to August. This seems by the description more akin to *Th. Serpyllum* than to *Th. Zygis*, for which latter it was taken by Pallas. The stem is procumbent, sending up numerous simple flowering-branches, six inches high, downy in the upper part. Leaves eight lines long, one and a half broad, on very short stalks. Calyx hairy, striated. It varies with leaves but half as broad.

6. *Th. vulgaris*. Common Garden Thyme. Linn. Sp. Pl. 825. Willd. n. 4. Ait. n. 2. Woodv. Med. Bot. t. 109. (*Thymum durius*; Ger. Em. 573.)—Stem shrubby, much branched, erect. Leaves ovate, revolute. Whorls crowded into leafy spikes.—Found on stony hills in Spain, Portugal, the south of France, Greece, and the Archipelago. Common in gardens, flowering during summer. The stem is bushy, woody and rigid. Leaves a quarter of an inch long, various in breadth, downy, of a greyish hue, numerous, with little axillary tufts of smaller ones. Flowers small, light purple, in hairy heads, or short spikes, with two or three remote whorls beneath. Calyx-teeth strongly fringed. This has usually a warm pungent flavour, like Winter Savory; but there is a sweet-scented variety, called Frankincense-Thyme, differing in no other respect from the common sort, which is commonly cultivated in Norfolk, and highly grateful to most people. The *βυβος* of Dioscorides is not, as Bauhin supposed, this plant, but *Satureja capitata*.

7. *Th. lanceolatus*. Lanceolate Thyme. Desfont. Atlant. v. 2. 30. t. 128. Willd. n. 5. Prodr. Fl. Græc. n. 1396.—Stem shrubby, erect. Leaves elliptic-lanceolate, obtuse, entire, downy, flat. Whorls crowded into a dense spike.—Found by professor Desfontaines, flowering in the early spring, on mount Atlas, and by professor Sibthorp in hilly places in Greece. Root creeping, woody. Stems numerous, simple or branched, about six inches high, downy. Leaves near an inch long, and one-third as broad, rather crowded; veiny and dotted beneath. Spikes two inches long, interspersed with lanceolate bractæas. Calyx downy. Corolla purple, glandular, about the size of the last.

8. *Th. numidicus*. Numidian Thyme. Desfont. Atlant. v. 2. 29. Willd. n. 6.—"Stem somewhat shrubby, erect. Leaves linear, spreading, smooth; ribbed beneath. Flowers capitate. Bractæas ovato-lanceolate, fringed. Calyx hairy."—Native of Barbary near La Calle. A little bushy shrub, four inches high, with slender upright branches, downy in the upper part. Leaves entire, with axillary tufts. Flowers in oblong heads. Calyx villous, striated. Corolla small, rose-coloured. Allied to *Th. Zygis*, but the leaves are quite smooth, not fringed; and the bractæas broader at the base. Desfontaines.

9. *Th. Zygis*. White Spanish Thyme. Linn. Sp. Pl. 826. Mant. 413. Willd. n. 7. Ait. n. 3. Sm. Fl. Græc. Sibth. t. 574, unpublished. (*Thymum angusto longioreque folio*; Barrel. Ic. t. 777. *Serpyllum sylvestris*, *Zygis Dioscoridis*; Clus. Hist. v. 1. 358. *S. creticum*; Ger. Em. 571.)—Stem shrubby, ascending. Leaves linear-lanceolate, obtuse, revolute; tapering and fringed at the base. Whorls crowded into leafy spikes.—Native of Spain and the Levant. Dr. Sibthorp gathered it on hills about Athens and Constantinople. Mr. Malcolm is said in Hort. Kew. to have had the plant in his garden in 1771. Linnaeus cultivated it at Upsal. The root is woody and perennial. Stems numerous, from four to six inches long, leafy, round, finely downy,

THYMUS.

downy, reddish, slightly branched, spreading on the ground before flowering, then ascending. *Leaves* three-quarters of an inch long, numerous, crowded, spreading, very minutely and densely downy, copiously dotted; ribbed and rather paler beneath; tapering into a short, broad, downy *footstalk*, coarsely fringed like the base of the leaf itself. *Flowers* in leafy heads, often with an axillary whorl below. *Calyx* clothed with recurved hairs; all its teeth tapering and parallel, strongly fringed. *Corolla* white, with red dots on the palate. *Anthers* reddish, prominent. Professor Sibthorp adopted the opinion of the old authors, that this might perhaps be the *ερωπιλος ζυγις*; of Dioscorides. Its appellation in modern Greek is *σμάρι*, which, if we mistake not, means "the delight of bees."

10. *Th. Acinos*. Basil Thyme. Linn. Sp. Pl. 826. Willd. n. 10. Fl. Brit. n. 2. Engl. Bot. t. 411. Curt. Lond. fasc. 1. t. 43. (*Acinos*; Rivin. Monop. Irr. t. 43. f. 2. *Ocimum sylvestre*; Ger. Em. 675.)—Flowers on simple footstalks, about six in a whorl. Stem herbaceous, ascending, branched. Leaves acute, serrated. Calyx gibbous at the base. Native of dry gravelly or chalky pastures, fallow fields, &c. throughout Europe, nor rare in England, flowering from July to September. The *root* is annual, of a few slender fibres. *Stems* clothed with recurved hairs, reddish, lax and spreading, hardly a span long; their flowery ultimate branches erect. *Leaves* on short footstalks, small, ovate, varying to roundish or oblong, but always acute, more or less deeply and copiously serrated, rarely quite entire, veiny, hairy; the upper ones tapering much at the base. *Flowers* light violet; their palate white, with dark purple spots. *Stamens* short. *Calyx* deeply furrowed, hairy, fringed, swelling underneath, as is the case, more or less, with all the species to which this is allied. The herb is rather slightly aromatic, not pungently so.

11. *Th. suaveolens*. Penny-royal-scented Thyme. Prodr. Fl. Græc. n. 1400. (*Clinopodium minus angustifolium*, *pulegii odore*, *romanum*; Bocc. Mus. v. 1. 50—54. t. 45, A.)—Flowers whorled. Leaves lanceolate-elliptical, pointed, somewhat serrated, hairy. Stems shrubby.—Native of Italy and Greece. The *stem* is a foot high, bushy; the branches leafy, rough, with recurved hairs. *Leaves* with their *stalks* about an inch long, rigid, ribbed, bristly, often quite entire. *Flowers* six or eight in a whorl, on simple stalks. *Calyx* like the last, but longer and more slender. The whole plant smells powerfully of Penny-royal, even after having been dried thirty years. On this subject Boccione has treated us with a long disquisition, quite in the Italian style, in which the facts are better than the philosophy, though some of those want confirmation. He attributes the above scent to particles of sulphur and bitumen communicated by the soil.

12. *Th. patavinus*. Marjoram-leaved Thyme. Jacq. Obs. fasc. 4. 7. t. 87. Willd. n. 11. Ait. n. 5. (*Clinopodium perenne*, *pulegii odore*, *majoranæ folio*, *patavinum*; Bocc. Mus. v. 1. 60. t. 45, B.)—Flowers whorled. Leaves ovate, with copious shallow serratures, slightly hairy. Stems shrubby.—Native probably of the south of Europe, though no botanist who has described this species seems to have known it but from gardens. Hence even its name originated, which is therefore liable to great exception. Willdenow appears to have seen no specimen. The specific character taken by him from the first edition of Hort. Kew. of "the inflated throat of the *corolla*, extending beyond the *calyx*," is not in the least degree peculiar. Nevertheless, authentic specimens of the plant prove it distinct from the foregoing and the following, in the broad-ovate, almost heart-shaped, figure of the rather fleshy *leaves*, their even surface,

and numerous, minute, shallow serratures. They much resemble some kinds of *Ocimum*, and like those are sometimes concave.

13. *Th. alpinus*. Alpine Thyme. Linn. Sp. Pl. 826. Willd. n. 12. Ait. n. 6. Jacq. Austr. t. 97. (*Clinopodium montanum*; Bauh. Pin. 225. Bocc. Mus. v. 1. t. 45, C. *C. austriacum*; Clus. Pann. 622, 623. Hist. v. 1. 353. Ger. Em. 676.)—Flowers on simple footstalks, about six in a whorl. Stem herbaceous, ascending, branched at the bottom. Leaves ovate or roundish, bluntish, coarsely serrated. Calyx gibbous at the base.—Native of the lofty mountains of Austria, Switzerland, Italy, and Crete, as well as of the Bithynian Olympus. Nothing is more difficult than to define the difference between this and our *Th. Acinos*, except that the *alpinus* is in every part larger and more handsome, with a strong resinous scent. The *root* is either biennial, or perennial, we are not certain which. The *leaves* are too entire in the cut of Clusius and Gerarde.

14. *Th. exiguus*. Small Cyprian Thyme. Sm. Prodr. Fl. Græc. Sibth. n. 1402. Fl. Græc. t. 575, unpublished.—Flowers very few in a whorl. Leaves rhomboid, pointed, oblique, nearly entire. Stems branched at the base. Tube of the *corolla* thread-shaped.—Discovered by Dr. Sibthorp in hilly situations in the island of Cyprus. The *root* is annual, simple, fibrous. *Stem* two or three inches high, erect, with simple leafy hairy branches from the bottom. *Leaves* one-third of an inch long, smoothish, on long hairy stalks. *Flowers* either two or four in each whorl, on thick stalks. *Calyx* slender, furrowed, hairy. *Corolla* with a very slender white tube, enclosing the *stamens*, and short, rounded, pale-purple segments in the limb.

15. *Th. pulegioides*. Penny-royal-leaved Thyme. Linn. Sp. Pl. ed. 1. 592. Sm. Prodr. Fl. Græc. Sibth. n. 1397. (*Cunila thymoides*; Linn. Sp. Pl. ed. 2. 31. Willd. Sp. Pl. v. 1. 123. *Acinos thymi folio annuus*, *floribus expansis*; Morif. sect. 11. t. 19. f. 6.)—Whorls many-flowered, crowded into long, dense leafy spikes. Leaves ovate, obtuse, entire. Stem herbaceous, branched, with four hairy angles.—Native of the south of France, and of hills in Greece.—*Root* fibrous, marked as annual by Linnæus, but the stems have a shrubby appearance. They are a span high, with opposite branches, leafy, their angles densely clothed with recurved hairs. *Leaves* stalked, from a quarter to half an inch long, deflexed, dotted, smooth, except a few occasional coarse marginal hairs. *Flowers* on longish, cylindrical, densely downy stalks, ten or twelve in each whorl. *Calyx* strongly furrowed, hairy, with a broad upper lip, and two long, narrow, fringed teeth in the lower one; the orifice densely hairy. *Corolla* small; its limb seems to resemble the last-described. Sometimes the *stem* is clothed with whorls of *flowers* almost from the bottom to the top, and the upper *leaves* are larger than the lower. The odour of the plant is that of Thyme, not of Penny-royal.

16. *Th. graveolens*. Strong-scented Greek Thyme. Sm. Prodr. Fl. Græc. Sibth. n. 1403. Fl. Græc. t. 576, unpublished.—Whorls barely six-flowered. Leaves ovate, rhomboid, obtuse, revolute, somewhat serrated. Stems much branched, shrubby.—Gathered on mount Parnassus, by Dr. Sibthorp, who suspected it might be the *πραγοριανος* of Dioscorides, and from whose manuscripts we have adopted the specific name. The strong, woody, branching *root* bears a tuft of numerous ascending, branched, leafy, reddish, downy *stems*, about six inches high. *Leaves* dark green, paler beneath, smooth, a quarter of an inch long, on *footstalks* of nearly their own length. *Flowers* on simple stalks, with a pair of small oval *bractææ* at the base of each stalk, usually

THYMUS.

usually three or four in a whorl, sometimes five or six. *Calyx* with a shortish furrowed tube, very gibbous at the base beneath; its upper lip broad; lower of two awl-shaped fringed teeth; both tinged with red. *Corolla* of a purplish crimson, large and handsome, downy in the mouth, as well as at the back, which latter is the case with *Acinos*, *alpinus*, and all of the same tribe.

17. *Th. marginatus*. Thick-edged Thyme. Sm. in Dickf. Dr. Pl. n. 71. (*Th. Piperella*; Allion. Pedem. v. 1. 21. t. 37. f. 3, excluding the synonyms.)—Stalks many-flowered, lateral and terminal. Leaves ovate, nearly smooth, ribbed, entire, with a thick cartilaginous margin. *Calyx*-teeth nearly equal. Stems shrubby, ascending.—On the rocks of the maritime alps of Piedmont very abundantly. *Allioni*. Of more humble stature than the last, with many round, slender, downy, purplish, ascending stems, about a finger's length, branched at the base only. Leaves nearly sessile, inclining to heart-shaped, covered with resinous dots, sometimes slightly downy, remarkable for their thick, smooth, pale margin. *Flower-stalks* chiefly axillary, about as long as the leaves, somewhat corymbose, downy, bearing several small ovate bracteas, and three or four flowers. *Calyx* cylindrical, furrowed; all its segments awl-shaped, and not very unequal, none of them fringed. *Corolla* with a slender hairy tube, twice as long as the calyx, and a short rounded limb. The whole plant is warm and pungent, highly aromatic. It is very distinct from the following.

18. *Th. Piperella*. Pepper Thyme. Linn. Syst. Nat. ed. 12. v. 2. 400. Willd. n. 14, excluding the synonym of Allioni, and possibly those of Vahl and Forskäll. (*Marum hispanicum nigrum*, flore purpureo, *Piperella hisp*; Barrel. Ic. t. 694. Bocc. Mus. 166. t. 117.)—Stalks many-flowered, lateral. Leaves ovate, somewhat heart-shaped, obtuse, entire, smooth, strongly ribbed, copiously dotted. Upper lip of the calyx very broad; lower fringed.—Native of Spain. The root is perennial. Stems apparently trailing, a span long, branched, bluntly quadrangular, finely downy. Leaves varying in size, but scarcely more than a quarter of an inch long at the most, thick, flat, without any cartilaginous edges, their ribs numerous, parallel and strong. *Footstalks* short, downy. Flowers in axillary, corymbose, downy, leafy tufts, with ovate bracteas. Upper lip of the calyx remarkably broad, and rather the longest, covered with resinous dots; lower strongly fringed. *Corolla* a little longer than the calyx, pale, dotted with resinous points. The odour of the plant is most like *Th. Serpyllum*. Vahl speaks of a border to the leaves, which induces a suspicion that he took our *marginatus* for *Piperella*.

19. *Th. Brownii*. Jamaica Thyme. Swartz. Prodr. 89. Ind. Occ. 1011. Willd. n. 15. (*Th. n. 1*; Browne Jam. 259.)—Stalks axillary, thread-shaped, single-flowered. Leaves orbicular-heart-shaped, crenate, smooth. *Calyx*-teeth ovate-lanceolate, nearly equal. Stem herbaceous, procumbent.—Native of moist grassy places, near rivulets, in Jamaica and Hispaniola, flowering all summer. The root is annual, fibrous. Stems a foot long, creeping, slender, quadrangular, smooth, often purple, with short leafy branches. Leaves about half an inch long, not unlike some of our annual *Veronica*, paler beneath, on slender stalks. Flowers purplish-white, small, on long, very slender, solitary stalks. *Calyx* cylindrical, smooth, strongly furrowed, with broad pointless teeth. Swartz says it has a very strong smell, like *Mentha arvensis*.

20. *Th. filiformis*. Minorea Thyme. Ait. n. 8. Willd. n. 16.—Stalks axillary, thread-shaped, single-flowered. Leaves heart-shaped, bluntly pointed, entire, with a thick cartilaginous margin. Stems thread-shaped, decumbent.—

Native of the Balearic islands. Introduced into our green-houses in 1770, by Mr. Malcolm. The root is perennial, woody. Stems from four to six inches long, trailing, purplish, slightly branched. Leaves stalked, agreeing with those of n. 17. in their tumid margin, but not half so large, and more pointed. Flowers very small. *Calyx* ovate, furrowed; its three upper teeth broadest and shortest; lower ones fringed.

21. *Th. incanus*. Hoary Calamint Thyme. Sm. Prodr. Fl. Græc. Sibth. n. 1405. Fl. Græc. t. 577, unpublished. (*Calamintha orientalis annua*, *ocymi folio*, flore minimo; Tour. Cor. 12, by the character.)—Whorls simply stalked, of about six flowers. Leaves roundish, entire, clothed with hoary down. Beard of the calyx concealed. Stems procumbent.—Common in the islands of the Archipelago, and about Athens. The root is woody, and but for Tournefort's synonym, we should judge it perennial. Stems herbaceous, numerous, diffuse, a foot long, with opposite leafy branches, clothed, like every part of the herbage, with fine, soft, grey pubescence. Leaves stalked, convex, ribbed, rounded and blunt, half an inch in diameter. Flowers scarcely projecting beyond the leaves, on simple hairy stalks. *Calyx* ovate, tumid, ribbed; with lips of equal length; the upper broad, abrupt, three-toothed: converging hairs of the throat concealed in the tube. Upper lip of the corolla pink, hairy; lower white; palate dotted with red.

22. *Th. grandiflorus*. Large-flowered Calamint Thyme. Sims in Curt. Mag. t. 997. (*Th. carolinianus*; Michaux Boreal-Amer. v. 2. 9. *Calamintha grandiflora*; Pursh 414.)—Whorls simply stalked, of about ten flowers. Leaves ovate, ferrated, nearly smooth. Beard of the calyx concealed. Stems erect, shrubby.—On the banks of the river Savannah, in Georgia and Carolina, flowering in July and August. *Pursh*. Cultivated by John Walker, esq. at Southgate, about 1804. The root is perennial. Stems bushy, with opposite branches, a foot or more in height. Leaves stalked, deflexed, above an inch long, green, somewhat downy to the touch only. Flowers large, pale purple, with a vaulted upper lip, and a dotted palate. Upper lip of the calyx very broad.

23. *Th. Calamintha*. Common Calamint Thyme. Fl. Brit. n. 3. Engl. Bot. t. 1676. (*Melissa Calamintha*; Linn. Sp. Pl. 827. Willd. Sp. Pl. v. 3. 147. *Calamintha*; Rivin. Monop. Irr. t. 46. f. 2. Matth. Valgr. v. 2. 76. *C. vulgaris officinarum*; Ger. Em. 687.)—Whorls stalked, many-flowered, forked. Leaves hairy, with shallow ferratures. Beard of the calyx concealed. Stem erect.—Native of dry banks, and the borders of fields, especially on a gravelly soil, in England and the more southern parts of Europe, flowering in July and August. The whole herb has a peculiarly sweet and grateful fragrance. The root is perennial. Stem twelve or eighteen inches high, hairy, with many opposite branches. Leaves broad, ovate, bluntish, on long stalks. Flowers copious, pale lilac, the whorls becoming leafless in the upper part of the branches. Bracteas brittle-shaped, fringed. *Calyx* ovate, furrowed, bristly; its broad upper lip deeply three-cleft; lower fringed.

24. *Th. Nepeta*. Lesser Calamint Thyme. Fl. Brit. n. 4. Engl. Bot. t. 1414. (*Melissa Nepeta*; Linn. Sp. Pl. 828. Willd. Sp. Pl. v. 3. 147. Curt. Lond. fasc. 6. t. 40. *Calamintha odore pulegii*; Ger. Em. 687. *C. folio incano*; Rivin. Monop. Irr. t. 47.)—Whorls stalked, many-flowered, forked, longer than the leaves. Leaves ferrated. Beard of the calyx prominent. Stem erect.—Native of chalky banks, and the borders of fields, plentifully in England, and throughout the south of Europe; very common in Greece and the Archipelago, flowering in August,

THYMUS.

August. The habit of this species is like the last, but with smaller *leaves*, more conspicuous longer-stalked *flowers*, and less upright *stems*. Its scent is different, and much stronger, resembling Penny-royal.

25. *Th. cephalotus*. Great-headed Portugal Thyme. Linn. Sp. Pl. 826. Willd. n. 17. Ait. n. 9. Vahl Symb. v. 3. 77. "Hoffm. et Link Lusit. v. 1. 127. t. 13." (*Tragoriganum dictamnii capite, hispanicum*; Barrel. Ic. t. 788. Bocc. Mus. 50. t. 43.)—"Heads of flowers with loosely imbricated, large, coloured bractæas, destitute of dots. Leaves linear, entire.—Native of Spain and Portugal. A shrubby bushy plant, with purplish *stems*, and downy *branches*. *Leaves* fringed at the base. *Flowers* concealed by the large purplish *bractæas*, forming an ovate head. Upper lip of the *calyx* rather the largest; lower fringed. We have seen no specimen, either of this or the next.

26. *Th. striatus*. Striated Neapolitan Thyme. Vahl. Symb. v. 3. 78. Willd. n. 18.—"Heads of flowers with closely imbricated, ovate, striated, dotted bractæas. Leaves linear-lanceolate, serrated, dotted in the margin."—Found by Cyrillo, in the kingdom of Naples. The *stems* are shorter and more upright than the foregoing; not branched in their upper part. *Leaves* broader, erect; striated at the back. *Heads* smaller, with smaller green *bractæas*. Vahl.

27. *Th. villosus*. Hairy Thyme. Linn. Sp. Pl. 827. Willd. n. 19. Ait. n. 10. "Hoffm. et Link Lusit. v. 1. 128. t. 14." Sm. Fl. Græc. Sibth. t. 578, unpublished.—Heads of flowers with imbricated, fringed, lanceolate, ternate, keeled bractæas. Leaves lanceolate, hairy, acute. Stems trailing.—Native of Portugal, Cyprus, and the Archipelago. The strong woody *root* sends out numerous, decumbent, branched, shrubby *stems*, which compose ample tufts, taking root as they spread, with short, simple, ascending flowering branches. *Leaves* clustered, nearly awl-shaped, dark green, fringed with coarse white hairs. *Bractæas* and *calyx* tinged with a violet purple; the upper lip of the latter oval, with three sharp teeth. *Corolla* rose-coloured, with a slender hairy tube, twice the length of the calyx. *Stamens* prominent.

28. *Th. Mastichina*. Mastick Thyme. Linn. Sp. Pl. 827. Willd. n. 20. Ait. n. 11. (Marum; Rivin. Monop. Irr. t. 40. Ger. Em. 670.)—Whorls stalked, many-flowered, crowded into round heads. Leaves ovate, obtuse, entire. Calyx-teeth awl-shaped, taper-pointed, all fringed, nearly uniform.—Native of stony ground in Spain and Greece. Dr. Sibthorp gathered it on mount Hymettus, near Athens, so famous for honey. This plant has been treasured up in many a rustic garden, or cottage window, ever since the days of old Gerard; but will scarcely bear our winters unprotected, for any length of time. It flowers throughout the latter part of summer. The figure of Rivinus is cited by mistake, in the usually accurate Hort. Kew. for *Teucrium Marum*. The *stem* of the present species is shrubby, twelve or eighteen inches high, erect and bushy, with many roundish, downy, leafy branches. *Leaves* numerous, stalked, about the size and shape of *Th. Scrypyllum*, but thicker, finely downy, and not fringed at the base; most hoary beneath. *Flowers* white, small, conspicuous for the long slender teeth of the *calyx*, which are pectinated with abundance of long bristly hairs. The tube is closed with copious white hairs, nor can we see any foundation for Linnæus's doubts, whether this plant should be referred to *Thymus* or *Satureja*, except the calyx-teeth being nearly equal, which is the case, more or less, with some of the foregoing. The odour of *Th. Mastichina* is pleasantly aromatic, not very pungent.

VOL. XXXV.

29. *Th. Tragoriganum*. Goat's Thyme. Linn. Mant. 84. Willd. n. 21. Ait. n. 13. Turr. Farset. 11. (*Tragoriganum majus*; Alpin. Exot. 79. t. 78. *T. secunda*, altera species; Cluf. Hist. v. 1. 355.) *T. cretense*; Ger. Em. 668.)—"Stem somewhat shrubby, erect. Flowers whorled. Leaves hispid, pointed."—Native of hills in Crete; as well of Cyprus and Bœotia, according to Dr. Sibthorp's manuscripts, though his herbarium contains no specimen. Neither does that of Linnæus, whose specific character we are obliged to copy. He describes it as a sweet-scented plant, with hairy *stems*, a foot high; *leaves* rather rigid, pointed at each end. The *root* appears to be woody and perennial. Whorls numerous, dense, of many *flowers*.

For *Th. virginicus*, Willd. n. 22, see *PYCNANTHEMUM*, n. 5. The same author has a *Th. inodorus*, n. 9, adopted from Desfont. Atlant. v. 2. 30. t. 129. A specimen apparently answering to this, gathered by Thunberg at the Cape of Good Hope, is preserved in the Linnæan herbarium, with a note at the back adverting to the singularity of a plant of the *Didymia Gymnospermia* having alternate leaves; and it is named *Satureja alternifolia*. We do not find that either Linnæus or Thunberg ever published this plant; possibly because of the uncertainty of its genus; or it may be among those which the latter has referred in his *Prodromus* to *Selago*, several of which we have no means of determining. Whether the plant of Desfontaines be the same or no, we dare not, without examination, consider it as a *Thymus*, though he describes the *calyx* as closed with hairs, which is certainly not the case with Thunberg's specimen.

THYMUS, in *Gardening*, contains plants of the low, aromatic, perennial kind; among which the species cultivated are, the wild thyme (*T. serpyllum*); the garden thyme (*T. vulgaris*); the mastick thyme (*T. mastichina*); and the Virginian or savory thyme (*T. virginicus*).

In the first sort there are several varieties; as the broad-leaved, the narrow-leaved, the variegated-leaved, the silver-striped-leaved, the citron-scented or lemon thyme, and the great purple-flowered.

And in the common sort there are different varieties; as the broad-leaved, the narrow-leaved, and the variegated or striped-leaved thyme.

Method of Culture.—These plants may be easily raised from seed, by slipping the roots and branches, and by cuttings; but the seed method is seldom practised, except with the second sort, or garden thyme. The seed should be sown in the early spring on light, rich, dry ground, which should be properly dug over, and the surface be made moderately smooth with the spade. As the seed is small, it should not be sown too thick, or be covered too deep: the seed is best sown while the ground is fresh stirred, either broad-cast on the surface, raking it in lightly, or in flat shallow drills, earthed over thinly: the plants appear in two or three weeks. It is necessary to be careful to keep them well weeded, giving occasional light waterings in dry weather; and by June they will require thinning, especially if the plants are to grow flocky, and with bushy full heads; in which case they should be set out to six or eight inches distance; when those thinned out may be planted in another place, in rows six or eight inches asunder, giving water till fresh rooted, keeping the whole clean from weeds by occasional hoeing between them in dry days, which will also stir the surface of the earth, and much improve the growth of the plants: they will be in perfection for use in summer, or early in autumn.

Sometimes the market kitchen-gardeners raise large quantities in beds, for daily supply, leaving the whole thick:

when of proper growth they pull them clean up, root and top together, from time to time, as wanted, and tie them in bunches for sale.

But it is always proper to thin out, or transplant a quantity in single bunches, to grow stocky and bushy for occasional supplies.

Some think the common thyme best cultivated for kitchen use in beds or borders, in rows at least half a foot apart, employing for the purpose either the young seedling plants, which are fit to set out, or the root slips of old plants, each of which soon increase into plants of bushy growths proper for being cropped for the above use. It may also often be well cultivated as an edging to herbary and other compartments; in both of which methods the plants multiply exceedingly fast by offsets, and are abiding, furnishing the means of great future increase. Some should, however, always be annually raised from seed in the above manner, as such plants possess a stronger aromatic quality than those from old ones.

When it is intended to increase any particular varieties, and continue them the same with certainty, it can only be effected by slips and cuttings.

In respect to the offsets and slips, all the sorts multiply by offsets of the root and slips of the branches: the rooted slips are the most expeditious method, as the old plants increase into many offset stems rising from the root, each furnished with fibres; and by taking up the old plants in the spring, &c. and slipping or dividing them into separate parts, not too small, with roots to each, and planting them in beds of good earth, in rows half a foot asunder, giving water directly, and repeating it occasionally in dry weather till they have taken root, and begin to shoot at top; they soon grow freely, and form good bushy plants in two or three months.

The strong slips of the branches without roots, succeed when planted any time in the early spring season in a shady border, in rows four or five inches distant, giving due waterings; and become good plants by autumn, when they may be planted out where they are to remain.

The cuttings of the young branches grow readily, the same as the slips, when planted at the same season in a shady place, and well watered.

The common thyme is in universal use as a pot-herb for various culinary purposes; it may also be employed in assemblage with other small plants, to embellish the fronts of flower-borders, shrubby clumps, small and sloping banks, &c. placing the plants detached or singly, to form little bushy tufts, and in which the variegated sorts, and the silver thyme and lemon thyme particularly, form a very agreeable variety. The lemon thyme is also in much estimation for its peculiar odoriferous smell. Some of each of these sorts may also be potted, in order to be moved occasionally to any particular places as may be required, and under occasional shelter in severe winters, to preserve the plants more effectually in a lively state; likewise some of the mallow thyme. Spanish and Portugal thymes are also sometimes potted for the same purpose, and to place under the protection of a garden frame or greenhouse in winter, to continue them in a more fresh and lively growth; and sometimes some of the smaller thymes are sown or planted for edgings to particular beds or borders for variety, such as the lemon thyme, silver-leaved and variegated sorts; also occasionally the common thyme; and all kept low, close and regular, by clipping them at the sides and tops annually in the summer season.

All the several sorts and varieties possess an aromatic quality, which principally resides in the leaves, whence it is

imparted and affords a fine agreeable fragrance. But the first three kinds are by much the most noted and valued in kitchen gardens, and more especially the common thyme, which is so very useful as a culinary herb.

In gathering this for use, in common gardens, it should in general only be cut or slipped as it is wanted, in small quantities at a time, and then not stumped off in too close a manner; but the mode pursued by market gardeners is quite different, as has been already seen.

THYNI, in *Ancient Geography*, a people of Thrace, according to Strabo. Among the Thracians of Asia, mentioned by Herodotus, we are to include the Bithynians and Thynians. These people were originally of Europe, and were driven from thence by the Teucrians and Mysians. They were also called Strymonians: and upon passing into Asia, they took the name of Bithynians. The Thynians were originally Thracians; inhabiting the environs of Salmydessus and Apollonia: and upon their removal to Asia, they occupied the sea-coast, and some part of the adjacent territory. These people had acquired the art of engraving precious stones: accordingly we find the following verse of Mevæus upon the death of Horace, preserved by Isidore in his *Origines*:

“Nec per candida margarita quæro
Nec quos Thynica lima perpolivit,
Amellos, nec jaspios lapillos.”

THYNIA, a country of Asia, in Bithynia. Pliny.

THYNIAS, an island of the Euxine sea, opposite to Bithynia, according to Pliny, but on the coast of Bithynia, according to Strabo.

THYNNIA, *θυμία*, in *Antiquity*, a sacrifice offered to Neptune by the fishermen, after a plentiful draught.

The word comes from *θυνοί*, a tunny, that being the sacrifice offered.

THYNNUS, in *Entomology*, a genus of the Hymenoptera order of insects: the characters of which are, that the mouth is horny; the mandible bent, with a short jaw, straight; the lip larger than the jaws, with the apex membranaceous; trifid; the intermediate fringes emarginate; the tongue very short or folded; the four palpi filiform and equal; the antennæ filiform. Gmelin enumerates three

Species.

DENTATUS. With black abdomen; the second, third, and fourth segments marked with two white points. Found in New Holland.

EMARGINATUS. With black abdomen, the segments having a yellow interrupted band; the scutellum emarginate. Found in New Holland.

INTEGER. Black, with the segments of the abdomen villose-cinereous at the margin, and the anus entire. Found in New Holland.

THYNNUS, in *Ichthyology*. See TUNNY, and SCOMBER, of which it is species.

THYOS, *θύος*, in *Antiquity*, an offering of fruits, leaves, or acorns, which were the only sacrifices at first in use.

THYRÆI, in *Ancient Geography*, a people of Italy, in Japygia, who inhabited the middle of the isthmus, between Tarentum and Brundisium, according to Strabo.

THYREA, a town of the Argolide, upon an eminence, in that part which adjoined Laconia, that is, on the western coast of the Argolic gulf. The country in which it was situated bore the name of Cynuria or Cynouria.—Also, a town of Greece, in the Phocide, where, according to Pausanias, Phocus, the son of Harmythion, placed a colony.—

Alfo.

Alfo, a place fituated on the coaft of the Peloponnefus. According to Herodotus, the inhabitants of Hermione gave it to thofe of Samos.

THYREUM, a fmall town of Arcadia, S. of Megalopolis. It was deferted in the time of Paufanias.

THYRIDES, a town of Laconia, S.E. of Meiffa. Near this place were the ruins of the town of Hippola, in the midft of which was feen, in the time of Paufanias, a chapel of Minerva Hippolaitis.—Alfo, the name of the fummit of Tænarus, in the Peloponnefus; 30 ftadia from the promontory Tænarum. Pliny gives the name of Thyrides to three iflands of the gulf Afineus.

THYROID, in *Anatomy*, *thyroideus*, or more properly *thyroideus*, from *θυροειδης*, compounded of *θυρος*, a *fhield*, and *ειδος*, *form*; a name given to one of the cartilages of the larynx (fee LARYNX), to a gland fituated near that cartilage (fee LARYNX), and to the arteries and veins of the gland. See ARTERY and VEIN.

Thyroid Gland, *Difeafed*. See BRONCHOCELE.

Thyroid Gland, *Extirpation of*. It cannot be doubted that this operation is one of the moft difficult and dangerous in the practice of furgery; and it ought never to be undertaken, except under the moft urgent circumftances, and by operators of confummate fhill and judgment. Were a furgeon, fuperficially acquainted with anatomy, and little accuftomed to attempts of fo bold a kind, to undertake the operation of cutting away a difeafed thyroid gland, he would run the utmoft risk of feeing the patient bleed to death under his hands.

The following is a memorable inftance of the fuccefsful performance of this operation. In the year 1784, J. Hyons, twenty years of age, experienced an acute pain at the middle and anterior part of the neck, in confequence of a violent extension of the head. This pain, which was only momentary, was followed by fome difficulty of motion. About three months afterwards, a fmall, hard, indolent tumour appeared on the right fide of the trachea. The fwelling was unattended with pain, or alteration in the colour of the integuments. The tumour feemed to be raifed by a pulfatory action, which tended to prove the exiftence of a large artery underneath, and, in fact, its bafe was fituated on the general courfe of the carotid artery. The patient feeling no inconvenience, neglected it until June 1788. At this time it was an inch in diameter. Its progrefs, which in the firft inftance was flow, now augmented with proportionable rapidity. Internal remedies and topical applications had no effect in preventing its increafe. A fluctuation in its centre was foon evident: an incifion was then made into this part, and a quantity of yellow ferofity difcharged. Three months after this operation, which was not of the leaft fervice, recourfe was had to cauftics, which were repeatedly applied without any advantage. On the 20th of March 1791, fhe prefented herfelf for admiffion at the Hôtel-Dieu. At this period the tumour was two inches in diameter, round, hard, and attached to the right and middle part of the trachea, and it pushed outwards the fterno-maftoideus mufcle. Independently of its being fenfibly raifed by each pulfation of the arteries, it obeyed the motions of deglutition, and in a flight degree impeded the paffage of the folid aliment. The patient, earneftly defiring to get rid of fo inconvenient a deformity, determined to fubmit to its extirpation, which appeared her only refource. The danger, the length of time, and the pain neceffarily annexed to the operation, were not concealed from her. The operation, after a few days previous preparation, was performed in the amphitheatre by Default in the following manner: the patient being laid on

her back, a little inclined on the left fide, with the head and neck more raifed than the reft of the body, the furgeon made a longitudinal incifion through the middle of the tumour, beginning one inch above, and finifhing one inch below, to allow room to finifh the operation with eafe: in the firft fection he cut down as far as the gland, dividing the integuments, the platyfma-myoides, and fome fibres of the fterno-hyoideii and fterno-thyroideii mufcles; an affiftant, with the view of fixing the tumour, drew towards the left the infide edge of the wound made by the incifion, whilft the furgeon detached it from the fterno-maftoideus mufcle. In diffefting the cellular fubftance which united the parts, two fmall arteries were divided, which were raifed by a pair of diffefting forceps and fecured by ligatures. The external furface of the tumour being thus difengaged, the internal part was detached in the fame way. The tumour was drawn outwards by means of a hook, that it might be feparated with more eafe from the anterior part and from the fide of the trachea. In the courfe of this diffeftion, the branches of the thyroid arteries were fuccefsively tied, as faft as they were divided. The affiftant, to whom the hook was confided, directed the gland from within and forwards, whilft the furgeon finifhed the diffeftion outwards and from above downwards. This part of the operation was the moft minute and difficult: it was neceffary by means of a fponge continually to wipe away the blood, which neceffarily prevented the parts from being eafily diftinguifhed, and obliged the furgeon to divide but a little at a time, and previously to feel with his finger thofe parts he was about to incife. By this cautious diffeftion of parts, the fuperior and inferior thyroid arteries were laid bare, and afterwards fecured by ligature by means of a blunt crooked needle. They were afterwards tranfverfely divided, and the remaining part of the tumour detached from the trachea, to which it ftrongly adhered. The wound refulting from this operation was near three inches in depth: it was outwardly bounded by the fterno-maftoideus mufcle, and inwardly by the trachea and œfophagus; pofteriorly by the carotid artery, and by the nerves of the eighth pair, which were expofed at the bottom of the wound. After the wound was well wafhed with warm water, and cleared from the blood, it was filled with coarfe lint, powdered with colophony; fquare compreffes, fecured by a bandage moderately tight, formed the reft of the dressing. The extirpated tumour was five inches in circumference; and on examination was found to differ in no particular from fchirrous glands, except that in the centre there was a cartilaginous nucleus. The patient fupported this long, difficult, and painful operation with uncommon firmnefs: fhe paffed the reft of the day without experiencing any other fymptom than a flight fhivering, generally confequent to large wounds. The following night fhe complained of a fenfe of heat in the neck, and fome difficulty in deglutition. The next day a little eafe was obtained by moiftening the dressing with a decoction of marfhmallows. A weak drink of the herb dog's-tooth, acidulated with oxymel, was prefcribed. On the third day the fever was very moderate, but the difficulty in fwallowing had confiderably increafed at this period; the compreffes and the external lint were removed, and frefh applied. On the fourth, the fever ceafed, and deglutition became lefs painful. Suppuration now became eftablifhed. The next day all the lint was detached, and the whole of the dressings renewed. The wound was in a good ftate: it was dressed with foft lint and compreffes moiftened with an emollient decoction; a practice which was continued for the following days. No particular circumftance occurred during the cure. The wound followed the ordinary pro-

grefs, and was cicatrized at the end of a month. The patient left the hospital, perfectly cured, the 34th day after the operation. See Default's Parisian Chirurgical Journal, vol. ii. p. 292—296.

To the preceding case, the editor of the above work has annexed the few following reflections.

The extirpation of the thyroid gland is an operation extremely difficult, and certainly highly dangerous, when performed by an operator but moderately exercised in the practice of his profession. The number and size of the arteries necessary to divide, the proximity of the trachea, œsophagus, and carotid, near which the knife must necessarily pass, are the principal dangers that the operator should avoid. These are the circumstances which have deterred the majority of practitioners from performing it, particularly those who from long established prejudice have been deterred from using ligatures in cases of wounded arteries. Examples of this operation are very rare. The first time that Gooch undertook to perform it, he was deterred from finishing it by the hemorrhage, and his patient died on the eighth day. The second time he succeeded better, but was incapable of securing the vessels, and succeeded in stopping the hemorrhage, which would otherwise have been mortal, by causing the parts to be compressed by the hand of an assistant for the space of eight days. Gooch's Med. and Chir. Obs. p. 130. Bell's System of Surgery, vol. v. p. 525. And La Bib. Chir. de Richter, l. 2. 4e partie, p. 128.

A. F. Vogel and Theden have practised the same operation with the most complete success. All danger from the hemorrhage, or inconvenience arising from the discharge of blood, may be obviated by pinching up the small vessels, tying them as fast as they are divided, and by discovering and tying the large vessels previous to their division; other parts that cannot be wounded without danger, are to be avoided by dissecting slowly and a little at a time, and feeling with the finger every part previous to its division with the bistoury.

THYRO-ARYTENODEUS, a muscle of the larynx. See LARYNX.

THYRO-EPIGLOTTICUS, a supposed muscle of the larynx. See LARYNX.

THYRO-HYOIDEUS, a muscle passing between the os hyoides and the thyroid cartilage. See LARYNX.

THYRO-PHARYNGEUS, a portion of the inferior constrictor of the pharynx. See DEGLUTITION.

THYROIDEÆ *Glandulæ Musculus*. See the description of the thyroid gland in the article LARYNX.

THYRRÆUM VINUM, a sort of wine among the ancients, remarkable for its thickness and dark colour; it was sweet and luscious, and not astringent.

THYRREUS LAPIS, in *Natural History*, the name of a fossil, which the writers of the middle ages have called *syrus*.

It has many virtues ascribed to it; but all the accounts we have of its real properties are from Pliny, who observes, that it swam upon the water while whole; but when broken into small pieces, these sunk to the bottom. It seems to have been a sort of bitumen of a spongy structure.

THYRSINE, in *Botany*, probably from its dense cluster-like appearance, a name given by Gleditsch to the *Cytinus*, (see that article,) in a treatise published in his *Physic. Botan. Oecon. Abhandlungen*, v. 1. 199. t. 2. He is cited in Schreb. Gen. 609, and Willd. Sp. Pl. v. 4. 589.

THYRSUS, *Θυρσος*, in *Antiquity*, the sceptre which the ancient poets put in the hands of Bacchus, and with which they furnished the Mænades in their Bacchanalia.

The thyrsus was originally a lance or spear, wrapped up in vine leaves; with which Bacchus is said to have

armed himself and his soldiers in his Indian wars, to amuse and deceive the unpractised Indians, and make them suspect no hostilities.

Hence it was afterwards borne in the feast and sacrifices of that god; and as the Satyrs, who were Bacchus's soldiers, were supposed to have fought with it, it became a custom to represent them therewith.

THYRSUS, *Oriflagni*, in *Ancient Geography*, a river of the isle of Sardinia, which ran from N. to S. and discharged itself towards the W. into the sea.

THYRSUS, in *Botany*, a Bunch, is a mode of inflorescence, nearly allied to a *Racemus*, or Cluster, except in being compound, in which it agrees with a Panicle. Its form is more or less ovate, and the disposition of the branches and subdivisions is either opposite or alternate; the ultimate one sometimes obscurely umbellate. Examples are found in the Lilac, *Syringa vulgaris*, and a bunch of Grapes, *Vitis vinifera*; as well as in the herbaceous plants *Tussilago hybrida* and *Petasites*. Hence it appears that a *Thyrus* is nothing more than a dense or close Panicle; and in the examples last cited, this mode of inflorescence actually becomes a loose panicle, as the plant perfects seed. See PANICULA and INFLORESCENCE.

THYSANOTUS, *βυσαντος*, fringed, a very descriptive name of Mr. Brown's, which he complains of Mr. Salisbury for having knowingly suppressed.—Brown Prodr. Nov. Holl. v. 1. 282. (*Chlamyosporum*; *Salif. Parad. 103.*)—Class and order, *Hexandria Monogynia*. Nat. Ord. *Coronarieæ*, Linn. *Aphodeli*, Juss.

Gen. Ch. *Cal.* none. *Cor.* inferior, of one petal, in six deep, spreading, permanent segments; the three inner ones broadest, fringed at the edges with jointed hairs; the three outermost externally of the texture of a calyx. *Stam.* Filaments six, awl-shaped, smooth, much shorter than the calyx, inserted into its base; anthers linear, incumbent, attached by the sinus at their base, a little unequal at the end, the three outer ones generally elongated and reclining. *Pistl.* Germen superior, roundish; style thread-shaped, declining, about the length of the stamens; stigma simple. *Peric.* Capsule oval, of three cells and three valves, with a partition from the centre of each, enveloped in the withered corolla. *Seeds* two in each cell, one erect, the other pendulous, roundish, somewhat stalked, inserted into a cup-shaped white appendage; albumen dense, fleshy.

Obs. A few species have only three stamens.

Ess. Ch. Corolla in six deep segments; the three innermost broadest, fringed; permanent. Stamens smooth. Capsule superior, of three cells and three valves. Seeds in pairs, with cup-shaped appendages.

A rather numerous genus of perennial herbaceous plants, natives of different parts of New Holland. The root is either fibrous, or consists of clustered fleshy bulbs. Stem generally branched and leafy. Leaves linear, narrow, often channelled, sometimes thread-shaped, or shortened. Flowers terminal, umbellate; rarely scattered; their stalks jointed in the middle. Corolla blue within; three, at least, of its segments green at the back. Anthers purple; the outer ones sometimes whitish, which in the triandrous species are wanting. Seeds black. The permanent corolla, and smooth filaments, principally distinguish this genus from Mr. Brown's *Arthropodium*, Prodr. Nov. Holl. v. 1. 276, by which it is related to the Linnæan *Anthericum*. The learned author whom we follow defines twenty-one species, of which he seems doubtful whether any one has ever been introduced into the English gardens, at least so as to bear flowers; for he thinks the figure in Parad. Lond. was done from

from a dried specimen. On this subject we have no particular information. Several drawings of this genus and its allies, made in New Holland, have passed under our inspection, and display a degree of elegance which renders the plants highly desirable.

Of the twenty-one species, seventeen are hexandrous, four triandrous.

SECT. 1. *Stamens six.*

Th. tuberosus. Tuberous Fringe-blossom. Br. n. 1.—“Bulbs fasciculated, stalked. Radical leaves channelled, lax, smooth, rather shorter than the round, smooth, panicled stem. Umbels of two or three flowers. Anthers unequal.”—Gathered by Mr. Brown, near Port Jackson, New South Wales.

Th. junceus. Rush-leaved Fringe-blossom. Br. n. 9. (*Chlamysporum juncefolium*; Salis. Parad. t. 103.)—“Root fibrous. Stems branched, diffuse, round, striated; branches slightly angular. Radical leaves short; those of the stem straight, slightly spreading. Umbels of few flowers. Anthers unequal.”—Native likewise of Port Jackson, from whence we have received specimens by favour of Dr. White. The stems are about a foot long, diffuse, according to Mr. Brown, smooth, slender, rusty, alternately branched.—Flowers about an inch in diameter, their inner segments obtuse, delicately fringed. They are said to be very transient.

Th. dichotomus. Forked Fringe-blossom. Br. n. 14. (*Ornithogalum dichotomum*; Labillard. Nov. Holl. v. 1. 83. t. 109.)—Root fibrous. Radical leaves hispid. Stem round, striated, with numerous rather spreading branches; forked above. Flowers solitary. Anthers unequal.—Gathered in Lewin's land by M. Labillardiere, from whom we have a specimen. The stem is 15 or 18 inches high, repeatedly divided from the bottom, so as to be almost corymbose at the top, roughish to the touch, slightly leafy. Radical leaves numerous, about four inches long, erect, linear, obtuse, entire, channelled, rough with short, rigid, pale, prominent hairs; sheathing at the base: those of the stem solitary under each branch, short, awl-shaped, striated, clasping the stem with a dilated, membranous margin in the lower part. Flowers terminal, two or three to each branch, but it appears to us that the individual ones are solitary. Three inner segments purple on the inside, with a fringe of the same colour; their outside, like the whole of the outer ones, green. Anthers but slightly, if at all, unequal. Valves of the capsule beaked.

SECT. 2. *Stamens three.*

Th. triandrus. Triandrous Fringe-blossom. Br. n. 18. (*Ornithogalum triandrum*; Labill. Nov. Holl. v. 1. 84. t. 110.)—“Root fibrous. Leaves linear, fringed, the length of the smooth unbranched common flower-stalk. Umbel many-flowered. Lower joint of each partial stalk several times longer than the bractæas.—Gathered by Labillardiere, in Lewin's land. Stalks one or more, compressed, a span high, as well as the numerous, all radical, leaves. Umbel of about nine flowers; its stalks jointed below the middle. Stamens but three, opposite to the three fringed segments of the corolla, which are purple on the inside.

THYSANUS, from *ὑσανος*, a fringe, because of the fringed tunic of the seed.—Loureir. Cochinch. 284.—Class and order, *Decandria Tetragynia*. Nat. Ord. *Terebintaceæ*, Juss.?

Gen. Ch. Cal. Perianth inferior, of five coloured, permanent, lanceolate, concave, hairy, spreading leaves. Corolla bell-shaped, of five spreading oblong petals, the size of the calyx. Stam. Filaments ten, short, reflexed; anthers roundish, erect, of two cells. Pist. Germen superior,

quadrangular; styles four, thread-shaped, inserted laterally into the four angles of the germen; stigmas slightly cloven. Peric. Drupas four, oblong, gibbous, recurved at the point, with a woolly coat, bursting laterally. Seeds. Nuts solitary, oblong-ovate, smooth, naked at the top, enveloped in their lower part with a fleshy, fringed, red tunic.

Ess. Ch. Petals five. Drupas four, gibbous. Nuts with a fringed tunic.

1. *Th. Palala.* Deei Khê of the Cochinchinese.—Native of the woods of Cochinchina. A large, woody, nearly erect, branching shrub, without thorns. Leaves pinnate, of about ten pair of oblong, entire, smooth leaflets. Stalks axillary, many-flowered. Calyx red. Corolla white. Wing, or tunic, of the nuts red.

Such is the description of Loureiro, who quotes, with a mark of doubt, *Palala secunda*; Rumph. Amboin. v. 2. 26. t. 6. But that is a *Myristica*, and has simple leaves. Yet hence the specific name appears to be taken. He more justly indicates the affinity of his plant to *Simaba*; Aubl. Guian. 400. t. 153, of which we propose to treat hereafter in its proper place, under Schreber's name of *ZWINGERA*.

We presume Loureiro's *Thysanus* to be very nearly related to *CNESTIS* of Jussieu and Willdenow; see that article. The number of germens may be very variable or uncertain. What the author terms a *drupa*, appears, from its bursting laterally, to be a true follicle, as is the seed-vessel of *Cnestis*. Whether the seed of the latter has any thing analogous to the fringed tunic, does not appear.

THYSDRUS, in *Ancient Geography*, a town of Africa Propria, and one of those which, according to Ptolemy, lay to the S. of Adrumetum.

THYSIUS, (THYS,) ANTONY, in *Biography*, a philologist, was born at Leyden in 1603, and became professor of eloquence and poetry in the university of his native city, and public librarian. Besides two or three works of his own, he was the editor of several editions of classics called “*Variorum*,” of which were “*Valerius Paterculus*,” “*Sallust*,” “*Valerius Maximus*,” “*Seneca the Tragedian*,” “*Lactantius*,” and “*Aulus Gellius*.” He died in 1670.

THYSSAGETÆ, in *Ancient Geography*, a people who inhabited the territory near the Sarmatæ, where was the source of the river Tanais. Ammianus Marcellinus says that these people had their abode in large forests, and lived by the chase. Their wives and children they had, he says, in common. Herodotus says they were a numerous nation, and governed by their own laws. Hardouin, in his notes on Pliny, says that they inhabited the banks of the Tanais, towards that bend of the river, where it most nearly approaches the Wolga, and which is now the territory of Astrachan.

THYSSELINUM, in *Botany*, a name adopted by Lobel in his *Icones*, 711, for the *Selinum sylvestre* of Linnæus. Lobel cites Pliny, but the name in that author is *Thysfelium*. The plant to which it belonged was “not unlike parslay, *Apium*; its root when chewed purged humours from the head.” Rivinus, Pentap. Irr. t. 19 and 20, has the Linnæan *Selinum sylvestre* and *palustre* under the generic name of *Thysfelinum*, as has Tournefort likewise, in his *Institutiones*, 319. The latter distinguishes his genus from *Oreofelinum* solely by its milky juice. As this juice is highly acrid, these authors should seem to consider the word as derived from *θυσις*, to burn, and *σέλινον*, parslay. Linnæus omitted the first syllable as, in his opinion, superfluous,

fluuous, and even Haller follows his example. See *SE-LINUM*.

THYSSUS, in *Ancient Geography*, a town of Macedonia, on and about mount Athos. Pliny and Thucydides.

THYSTIUM, or **THYTIUM**, a town of Etolia. Suidas.

TIABA, a town of Asia Minor, in Caria. Strabo.

TIAGAR, a town in the interior of Arabia Felix, between Inapha and Appa. Ptolemy.

TIAGAR, in *Geography*, a town of Hindoostan, in the Carnatic; 50 miles W.S.W. of Pondicherry. N. lat. $11^{\circ} 42'$. E. long. $79^{\circ} 12'$.

TIAGNANUCO, a town of Peru, in the diocese of La Paz. This is a town of great antiquity, and is said to have received its name from one of the Incas. In it are some statues, and a colossal pyramid, with a variety of human figures cut out of stone, which, though decayed by time, appear to have belonged to some gigantic nation; 36 miles N.W. of La Paz.

TIAGURA, in *Ancient Geography*, a town of India, on this side of the Ganges, and E. of the river Nomadus. Ptolemy.

TIANG-POTAO, in *Geography*, an island of Corea, about thirty miles in circumference, in the Hoang-hai. N. lat. $37^{\circ} 20'$. E. long. $124^{\circ} 52'$.

TIANO. See *THEANO*.

TIANO, a small island in the North sea, near the coast of Lapland. N. lat. $68^{\circ} 42'$.

TIANTEGNIES, a town of France, in the department of Jemappe; 6 miles S.W. of Tournay.

TIANTONG, a town of Upper Siam, on the Mecon; 60 miles N.W. of Porfloeuc.

TIAOYU-SU, a small island in the Chinese sea, belonging to those called Lieou-kieou. N. lat. $25^{\circ} 55'$. E. long. $123^{\circ} 37'$.

TIARA, *Tiara*, an ornament, or habit, with which the ancient Persians covered their heads; and which the Armenians and kings of Pontus wear on medals: these last, because descended from the Persians.

Latin authors call it indifferently *tiara* and *cidaris*.

Strabo says, the tiara was in form of a tower; and the scholiast on Aristophanes's comedy, *Αχαρναι*; act i. scene 2. affirms that it was adorned with peacocks' feathers. Some moderns, however, fancy the scholiast is here speaking of the casque which the ancient Persians wore in war, rather than of the habit which they wore on the head in the city.

The kings of Persia alone had the right of wearing the tiara straight and erect; the priests and great lords wore it depressed, or turned down on the fore-side. Xenophon, in his *Cyropædia*, says that the tiara was sometimes encompassed with the diadem, at least in ceremonials; and had frequently the figure of a half-moon embroidered on it: others are of opinion, that the diadem was in figure of a moon; and that it was hence the *tiara* was called *lunata*. Lastly, others think that the tiara itself was made sometimes in form of a half-moon. From what we have said, it appears that there were different forms of tiaras; and, in effect, Paschalius, De Coronis, distinguishes no less than five different kinds. See *DIADEM*.

The tiara was also an ornament belonging to the Jewish priests. Exod. xxviii. 40. xxxix. 26.

TIARA is also the name of the pope's triple crown; anciently called *regnum*.

The tiara and keys are the badges of the papal dignity; the tiara of his civil rank, and the keys of his jurisdiction: for as soon as the pope is dead, his arms are represented with the tiara alone, without the keys.

The ancient tiara of the popes was a round high cap.

Boniface VIII. first encompassed it with a crown. Benedict XII. added a second crown; and John XXIII. a third.

TIARANTUS, in *Ancient Geography*, a river of Scythia, which ran into the Danube; now the *Alut*.

TIARE, a town of Asia Minor, in the Troade. Pliny.

TIARELLA, in *Botany*, the diminutive of *τιαρα*, a Persian diadem, or ornament for the head. This name alludes to the form of the seed-vessel, and was contrived by Linnæus to preserve an analogy with *MITELLA*, see that article, to which the present genus is next akin.—Linn. Gen. 223. Schreb. 301. Willd. Sp. Pl. v. 2. 659. Mart. Mill. Dict. v. 4. Ait. Hort. Kew. v. 3. 72. Pursh 659. Juss. 309. Lamarck Illustr. t. 373.—Class and order, *Decandria Digynia*. Nat. Ord. *Succulenta*, Linn. *Saxifrage*, Juss.

Gen. Ch. *Cal.* Perianth inferior, of one leaf, in five deep, ovate, acute, permanent segments. *Cor.* Petals five, oblong, their claws inserted into the calyx. *Stam.* Filaments ten, capillary, longer than the corolla, inserted into the calyx; anthers incumbent, orbicular. *Pistl.* Germen superior, cloven, terminating in two very short styles; stigmas simple. *Peric.* Capsule oblong, somewhat compressed, of one cell and two flattish valves, one of them twice as long as the other. *Seeds* numerous, ovate, polished.

Eff. Ch. Calyx in five deep segments. Petals five, undivided, inserted into the calyx. Capsule of one cell, with two unequal valves.

Obf. The undivided petals, and the inequality of length in the two valves of the capsule, distinguish this genus from *Mitella*.

1. *T. cordifolia*. Heart-leaved Tiarella. Linn. Sp. Pl. 580. Willd. n. 1. Ait. n. 1. Pursh n. 1. Lamarck as above. (*Cortufa americana*, flore spicato, petalis integris; Herm. Parad. 129, without a figure.)—Leaves heart-shaped, acutely lobed, with pointed teeth. Cluster simple, ovate.—Native of the shady woods of Canada, and the high mountains of New York and Pennsylvania, flowering in April and May. *Pursh.* It is hardy in our gardens, flowering at the same season, but chiefly preserved in the more curious collections only. The root is tuberous, with many blackish fibres, perennial. *Leaves* several, all radical, light green, hairy, elegantly lobed and veined, acute, about an inch and half in diameter, on erect, simple, hairy footstalks, thrice as much in length. *Flower-stalk* radical, mostly solitary, unbranched, hairy, taller than the leaves, bearing a simple downy cluster, an inch long, of about twenty small, delicate, white flowers, which is subsequently elongated as the fruit ripens. The capsules then become deflexed, two-lipped, ribbed, smooth, and shining. It is wonderful that every author should persist in quoting, after Linnæus, the plate of Hermann's *Paradisus*, which is evidently *Heuchera americana*, and is mentioned under the name of *Cortufa americana*, flore squallidè purpureo, in the text of the same work, p. 131; where also this figure is referred to. The editor, having committed a double blunder, in the title of the plate and its reference, 130 instead of 131, is in some measure responsible for the mistake; which however the compound *panicle*, and closed calyx, ought to have sooner corrected.

2. *T. Menziesii*. Slender-spiked Tiarella. Pursh n. 2.—“Leaves ovate-heartshaped, acute, toothed, with shallow lobes; those of the stem alternate, remote. Cluster thread-shaped, somewhat spiked. Calyx tubular.”—Gathered by Mr. Menzies, on the north-west coast of America. Perennial. More than a foot high, with five or six alternate leaves on the stem. *Pursh.*

3. *T. trifoliata*. Three-leaved Tiarella. Linn. Sp. Pl. 580. Willd. n. 2. Pursh n. 3. (*Mitella foliis ternatis*; Linn. Am.

Am. Acad. v. 2. 351.)—Leaves ternate, lobed and toothed. Stem leafy. Clutter compound.—Gathered by Mr. Menzies on the north-west coast of America, where it is frequent in woods. Linnæus saw it only in the collection of plants from Kamtschatka, submitted to his inspection by Demidoff, and described in the 2d volume of the *Amanitates Academicæ*; for there is no specimen in his own herbarium. The root is tuberous, and somewhat creeping, perennial. Stems above a foot high, erect, simple, leafy, smooth and slender. Leaves all ternate, slightly hairy, paler beneath; the leaflets somewhat rhomboid, acute, more or less deeply lobed, and irregularly notched, an inch or an inch and half in length; the lateral ones often deeply divided; so that they much resemble some of the more delicate species of *Rubus*. The radical leaves have long slender footstalks; those on the stem short ones. Cluster many-flowered, from three to six inches long, alternately branched; the branches corymbose, each bearing from three to six or seven very small greenish-white flowers. The base of the calyx is concave, or slightly bell-shaped. Capsule half an inch long, each valve tipped with a permanent, elongated, capillary style.

4. *T. biternata*. Compound-leaved Tiarella. Venten. Malmaif. t. 54. Pursh n. 4.—Leaves twice ternate, lobed and toothed. Stem leafy. Panicle compound, divaricated; its branches somewhat spiked.—Found on the mountains of South Carolina, flowering in May. Root perennial. Stem a yard high. The appearance of the plant is justly compared by Ventenat to *Spiræa Aruncus*. The leaves consist of nine large ovate leaflets, slightly hairy, partly lobed, and all strongly toothed, or notched. Flowers very small, yellowish-white, almost sessile, disposed in numerous long clusters, forming a large, spreading, repeatedly branched panicle. The petals in Ventenat's figure are narrow, elliptic-lanceolate. Pursh says they are sometimes wanting. The appearance of the capsule in that figure is very different from the other species, and the valves are of equal length. This plant is said to have proved biennial in the garden of Malmaison; but it may still be perennial in its native country. We have seen no specimen, nor has this curious species, any more than the last, yet found its way into the English gardens.

TIARINI, ALESSANDRO, in *Biography*, an historical painter, who was born at Bologna in 1577. He was first a disciple of Prospero Fontana, but on the death of that master, he received instructions from Bartolomio Cesi, from whom, being obliged to leave Bologna on account of a quarrel, he went to study under Passignano at Florence. After some time, about seven years, as the influence of the circumstance which had driven him from his native city subsided, he ventured to return there, and became a pupil of the Caracci; and he principally attached himself to Ludovico, more for the improvement of his style, than for practice.

He had, during his residence at Florence, acquired considerable fame, and painted several pictures for churches and convents in places within and round about that city. On his return to Bologna, his talents acquired him considerable employment there, and many of his principal works still adorn its public edifices. Ferdinand, duke of Mantua, invited him to take up his residence with him; sat to him for his portrait, as did all the princes of his family, and many of the nobles of his court.

The colouring adopted by Tiarini in his best time is clear and rich; his design tasteful and agreeable, though of a serious cast; and his expression just and natural: and there are not many artists who have done more credit to the Bolognese school. He died in 1668, at the advanced age of 91.

TIARIULIA, in *Ancient Geography*, a town of Hif-

pania Citerior, in the interior of the country of the Iberians. Ptol.

TIARP, in *Geography*, a town of Sweden, in Westmanaland; 25 miles N. of Upsal.

TIASSE, in *Ancient Geography*, a river of the Peloponnesus, in Laconia, which ran between Sparta and Amyclæ. Paufanais.

TIASUM, a town of Dacia, in the vicinity of Nantidava and Zugma. Ptol.

TIAUSPA, a town of India, on this side of the Ganges, W. of this river and near it. Ptol.

TIB, in *Geography*, a town of Persia, in Chusistan, or Kuzistan; 60 miles N.W. of Shuster.

TIBAENS, a town of Portugal, in the province of Entre Duero e Minho; 4 miles W. of Braga.

TIBALDI, PELLEGRINO, in *Biography*, was born at Bologna in 1527. He was the pupil of Bagnacavallo, and copied with much attention the works of Vafari, in the refectory of S. Michele in Bosco. At the age of twenty he went to Rome, chiefly to study the works of Michael Angelo. The pictures he produced at Rome obtained for him the patronage of the cardinal Poggi, who employed him in ornamenting his Vigna, near the Porto del Popolo, with works in fresco, and then sent him back to Bologna, to assist in the completion of his palace there (now the Academical Institute), both as architect and painter; and in both characters it remains as the principal testimonial of his powers remaining in Italy. He also constructed and adorned a chapel for his patron in the church of S. Giacomo Maggiore. One of the paintings he executed there was the Preaching of St. John, and another, the Last Judgment; where, in the opinion of the Caracci, he almost equalled the majesty of Michael Angelo, and it was preferred by them to all the other works of Pellegrino, and served them and their scholars as a model of study.

From Bologna, the cardinal sent him to Loretto, to superintend the erection of a chapel in the church of La Madonna, which he also ornamented with stuccoes and paintings of the Nativity, the Presentation in the Temple, the Transfiguration, and the Decollation of St. John. From thence he went to Ancona, where he wrought in the churches of S. Agostino and Ciriaco; and in the great hall of the merchants he painted one of his most celebrated pictures, the subject of which is Hercules overthrowing monsters. He also superintended, as military architect, the fortifications of the place, about the year 1560; and two years afterwards visited Pavia, where he constructed the palace of the Sapienza; he then went to Milan, and there built the temple of S. Fidele, and before the year 1570 was elected architect of the cathedral.

Here he disencumbered the dome of numerous Gothic monuments, sepulchral urns and trophies, and embellished it in their stead with various chapels and a majestic choir. He soon after received a commission from Philip II. to prepare designs and plans for adorning the Escorial, both architectural and pictorial. He followed them to Spain himself in 1586. There he superintended the work for nine years, painting a great number of pictures, particularly some in fresco in the lower cloister, whence he expunged the unsuccessful productions of F. Zuccherò. The subjects were from scripture, of the Purification; the Flight into Egypt; the Murder of the Innocents; Christ tempted in the Wilderness; the Election of the Apostles; the Resurrection of Lazarus; the Expulsion of the Money Changers from the Temple; and the Resurrection of our Saviour. Besides these, he painted during his residence in Spain several pictures

tures for other places, particularly for the great church at Madrid, where there are five pictures by him. But his most renowned work, and which most contributed to establish his fame in Spain, was the ceiling of the library of the Escorial, where he appears to have rivalled the composition of the school of Athens by Raphael; with beautiful groups of children and figures supporting the cornices and festoons in great varieties, and foreshortenings worthy of an imitator of the style of Michael Angelo. For the extraordinary talents which he exhibited in these great works, Philip loaded him with riches and honours, and even gave him patents of nobility, creating him marquis of Valdelfa; a district in which his father and his uncle had laboured in the humble capacity of masons. He lived to an advanced age, but the exact year of his death is not known, though it is thought to have been about 1600.

Pellegrini Tibaldi is considered, and with sufficient evidence from his works, as the greatest designer of the Bolognese and Lombard schools. He approaches the line of Michael Angelo nearer than all the rest of his imitators; but as he had decidedly adopted the technic without always penetrating the moral principles of his model, the manner of the master frequently became the style of the pupil; though it cannot be denied that he often united energy of attitude and grandeur of line, with sublimity of conception and dignity of motive. Of these he has given no where more signal proofs than in the ceilings and the compartments of the Academical Institute at Bologna. They represent various scenes from the Odyssey; among them, Polypheme waking under the pangs of the fiery point, though painted with a sentiment of original expression, is evidently imitated from the newly created figure of Adam in the Sistine; but the same Cyclops groping at the entrance of his cave to prevent the escape of Ulysses and his associates, is in conception of the whole, and in the detail of the parts, an original invention; a form, than which Michael Angelo himself never conceived one of greater energy, with expression, attitude, and limbs more in unison. With this may be placed that wonder of foreshortening, excentricity, and rotundity, the figure of Elpenor, on one of the architraves of the Salotto, represented in the moment when, yet dreaming, he leaves his hold, and is precipitated from the roof. The air of originality which this figure in every view presents, and the elegance with which the imitator has reversed the figure in the Last Judgment of Michael Angelo, from which he borrowed the principal limbs of his own, place him on a level with the inventor.

It was, however, less for the powers exerted by Pellegrino, in the decorations of the Institute, than for the eclectic principle which they discovered in his subsequent works, that the Caracci gave him the epithet of *Michel Angelo riformato*, and commended

“Del Tibaldo il decoro e il fondamento.”

The compositions of the chapel Poggi, in St. Giacomo, where the imitation of Michael Angelo is blended with that of Raphael, Corregio, and D. da Volterra, contain the rudiments of their own system.

Pellegrino Tibaldi is more known by his works in fresco than by his pictures in oil, which are extremely scarce: one of the earliest is the Nativity, already mentioned, in the Palace Borgheze, of which the cartoon still exists in a private collection of drawings. It is painted in a sober unaffected tone, and considered as the work of an artist jealous of his line, with great mellowness of touch. The figures of this are considerably less than the size of life; but there are pic-

tures of his to be met with of diminutive dimensions, with all the finish of miniatures, though rich in figures, touched with great spirit and equal vivacity of colour: they are generally let off by backgrounds drawn from his favourite branch of art, architecture. Fufeli's Pilkington.

TIBARANIA, or TIBARÆNIA, in *Ancient Geography*, a country of Asia, in Pontus, in the vicinity of Cappadocia, and adjoining the country of the Chalybes. Steph. Byz.

TIBERIA, a town of Thrace, founded by the emperor Tiberius, whence its name.

TIBERICUM, a town of Italy, near Ravenna.—Also, a town of Lower Germany, upon the route from Colonia Trajana to Colonia Agrippina, between this latter place and Juliacum, according to the Itinerary of Antonine.

TIBERIADES WATER, the water of a hot spring near Tiberiades in Egypt.

Dr. Perry, when on the spot, tried some experiments on this water, which give us a much better idea of its nature than we have from any other accounts of it. Half a drachm of oil of tartar being mixed with an ounce and half of the water, it becomes turbid and muddy; and after twelve hours, three parts of the whole appear like white wool, only leaving a small portion of clear water at the top. The white woolly matter dried, produced only a small quantity of yellow ochre.

Spirit of vitriol added to the water in the same quantity, affords a large unctuous sediment of a white colour. A solution of sublimate being mixed in the same quantity, it became turbid and yellowish, and yielded an earthy sediment in small quantity; whence it seems evident, that it contains a sal murale. Saccharum saturni being added in the same quantity, the water deposited a lateritious sediment in a small quantity. Mixt with spirit of sal ammoniac, it turns to a blueish-green turbid liquor, and finally yields a woolly sediment. Sugar of violets mixed with it, turned it to a yellow colour; and the scrapings of galls mixed with it, turned it to a deep purple; and on shaking, this became as black as ink.

It appears from these experiments, that the water contains a good deal of a gross fixed vitriolic salt, some alum, and a sal murale. It is too salt and nauseous for internal use; but it must be of use as a bath in all cutaneous foulnesses, especially in scorbutic and leprous cases; for it will powerfully deterge, scour, and cleanse the excretory pores, and it may be, by its weight and stimulus, restore them to their natural state and tone, and restore the true state of the vitiated solids in general. Phil. Trans. N^o 462. p. 52.

TIBERIANI CAMPI, in *Ancient Geography*, fields of Italy, in the vicinity of Rome, which took their name from the emperor Tiberius, who fixed them at 25 acres.

TIBERIAS, a town of Palestine, the capital of Galilee, was situated in a plain, near the lake of Genesareth, which from this city was also called the lake or sea of Tiberias. This city is very famous, and often mentioned by Jewish writers, because, after the taking of Jerusalem, there was at Tiberias a succession of Hebrew judges and doctors till the fourth century. It was a bishop's see in this century. Epiphanius says that a Hebrew translation of St. John, and the Acts of the Apostles, was kept in this city. It was distant about 90 miles from Jerusalem. See TABARIA.

TIBERINA INSULA, the isle of Tiber, situated in the city of Rome; called by Suetonius the isle of Æsculapius. Plutarch says that this island was called at Rome the sacred isle and the isle of two bridges, because in consecrating to Mars a field which belonged to the Tarquins, they threw into the

the river the corn and also the trees which grew in this field. These materials, united with the mud brought down by the river, formed an island, on which were built several temples and porticoes.

TIBERINA Regio, a country of Asia, in Cappadocia, where was a place named Ariarzus.

TIBERIOPOLIS, a town of Asia, in Phrygia Major. Ptol.—Also, a town of Bulgaria, upon the coast of the Euxine sea.

TIBERIS, or **TIBER**, a river of Italy, which had its source in the Apennines, towards a place called Tifernum Tibarinum. Its course was first towards the S. passing by Perugia, as far as Tuder, where it turned towards the S.W. as far as the Volturni. Having received the Clanis, it turned towards the S.E., received the Nar at Hortanum, and continued in this direction as far as a point that lies between Capena and Cures. Assuming a direction towards the S., it passed to Rome, and then proceeded towards the S.W. to the sea before Ostia, *i. e.* the mouths, of which it has many. This river was inconsiderable till it reached Hortanum; but afterwards it was augmented by the Nar, the Valinus, and the Anio, so that at Rome it was large and deep. The ancients, by way of enhancing its celebrity, represent it as receiving twenty other rivers; but under this general denomination they must comprehend several small streams. It was called by various names.

TIBERIUS CLAUDIUS NERO, in *Biography*, a Roman emperor, so called after his father, his mother's name being Livia Drusilla, was born in the year B.C. 42. He was at an early age so well instructed in Greek and Roman literature, as to be able, when nine years old, to pronounce a funeral oration for his father, which gained great applause. His temper was naturally reserved and gloomy, and yet, with the advice of his mother Livia, who was married to Augustus, he conducted the usual spectacles with a magnificence which gave satisfaction to the Roman people. His first appearance in a military character was as a tribune in the Cantabrian war; he next sustained the office of commander-in-chief in placing Tigranes on the Armenian throne, and on his return was made prætor. He was afterwards sent to join his brother Drusus, and gained a decisive victory over the Rhetians and Vindelicians. He became consul in the twenty-eighth year of his age, and thus rapidly advanced to the rank which, as the emperor's step-son, he was likely to obtain, and his elevation was accelerated by the death of Agrippa, B.C. 22. Previously to his being admitted into a partnership of the empire, Augustus obliged him to divorce his wife Vipsania, the daughter of Agrippa, and the object of his choice and affection, and to marry his own daughter Julia, of doubtful reputation.

The next object of his military career was the reduction of the Pannonians, in consequence of which he was honoured with triumphal ornaments. From his successful prosecution of the war in this part of the empire he was suddenly called to attend his brother Drusus in his last moments: and he afterwards accompanied his remains on foot in a funeral procession to Italy. After his victories had been celebrated by an ovation, he was deputed to make peace in Germany, and being a second time made consul, B.C. 7, he triumphed on the day when he took possession of his dignity. At the expiration of the year, Augustus conferred upon him the tribunitian power for five years. At this time Caius, one of the emperor's adoptive sons, though under age, was raised to the pontificate, and introduced into the senate. Jealous of Caius as a rival, and disgusted by the open gallantries of his wife Julia, he resolved to ask permission to withdraw from public business, and to live in retirement at the

island of Rhodes. Accordingly he sailed for Rhodes. His wife's conduct became so notorious, that she was banished by her father to the isle of Pandataria, and divorced from her husband. Having obtained leave of the emperor, though reluctantly granted, to return from Rhodes to Rome, he lived privately till the death of the two Cæsars, Caius and Lucius, opened to him new prospects. The emperor, whose declining age needed an associate, adopted Tiberius A.D. 4, renewing his tribunitian power, and then placing him next to himself in the empire. Having brought the war against the Pannonians and Dalmatians, as much by policy as by force, to an honourable termination, he obtained a triumph, A.D. 9; and as a recompence of other services, his tribunitian authority was prolonged: but the emperor terminating his life at Nola, Tiberius, without opposition, succeeded to the empire, in the fifty-fifth year of his age. Past experience had taught him the art of dissimulation, and this art he practised during the progress of his reign. Although he was very jealous of his authority, he was moderate in the exercise of it, and always paid great deference to the senate, and respect to the consuls. He was zealous in the administration of justice, and avoided oppressive imposts even in the most distant provinces, for which he had the less occasion, as he was not avaricious of money; a virtue which, as Tacitus says, he retained, when he had renounced all others. To which we may add, that he was munificent in his relief of public calamity and private distresses. These qualities, combined with his sound sense, rendered the earlier part of his reign as prosperous as perhaps any in the annals of the empire.

The popularity of Germanicus rendered Tiberius jealous, and vigilant of his conduct; and in order to restrain his authority, he employed Piso, a man of ancient family and imperious spirit, as his subordinate agent for this purpose. Germanicus, however, died of a lingering disease, and Piso was suspected, if not accused, of having given him poison. Piso was impeached in the senate for his conduct towards Germanicus. In the course of his trial, Tiberius acted with apparent impartiality; but the accused, despairing of an acquittal, put an end to his own life. Tiberius, in the seventh year of his reign, withdrew from Rome to Campania, in order to accusom Drusus, who was then consul, to the exercise of the supreme power. Notwithstanding several instances, in which he manifested a moderate exercise of power, a stern unfeeling tyranny was becoming the settled character of his reign, to which his growing confidence in the detestable Sejanus very much contributed. The death of Drusus, A.D. 23, occasioned by poison, administered in consequence of the seduction of his wife, was borne by his father Tiberius with a degree of self-possession, which was imputed to want of natural affection. After this event he appeared in the senate: and the two elder sons of Germanicus were presented to him. Taking them by the hand, and delivering a speech which melted the whole assembly into tears, he recommended these orphans, who had lost both their uncle and father, to the guardianship of the senate. Two years after the death of Drusus, Tiberius took an opportunity, which a proposal for erecting a temple to him and his mother afforded him, of giving his sentiments on that deification which disgraced the reigns of the Roman emperors. Recognizing himself as a mere mortal, subject to all the infirmities of the human condition, and sufficiently honoured in holding the first place among men, he was desirous that posterity should know his sentiments on the subject, and that he wished for no other honours paid to his memory than to be thought to have worthily performed the duties of his station. The whole speech, replete with wisdom

dom and good sense, is reported by Tacitus. His design of retiring from the capital, encouraged for selfish purposes by Sejanus, was put into execution A.D. 26. Accordingly he withdrew into the isle of Capreae, near the bay of Naples. Here he passed his remaining years, immersed in gross and infamous debauchery, hating mankind, scarcely known to exist but by his cruelties, and rendering himself, in direct opposition to his own maxims, "let them hate, provided they esteem me," no less contemptible than odious. It ought to be mentioned, however, that in a conflagration which consumed a large quarter of Rome, he displayed a very laudable and spontaneous munificence. For an account of his connection with Sejanus, and of the effects and termination of that connection, we refer to the article SEJANUS. The latter part of Tiberius's reign was marked by fervility on one hand, and despotic ferocity on the other; and it appears by one of his letters to the senate, that he suffered as much misery from the anguish of self-reproach and tumult of mind as he inflicted: "What I shall write to you, conscript fathers, or what I shall not write, or why I should write at all at this time, may the gods and goddesses plague me more than I feel daily that they are doing, if I can tell!" What mental torture it must have been, says Tacitus, that could have extorted such a confession. Some few occasional acts of wisdom and munificence brightened in a faint degree the black picture that was exhibited by his general conduct. Towards the close of life, and at an advanced age, the appointment of a successor engaged his attention. He had two alternatives; the one was the nomination of Caius, his grandson, the son of Germanicus, who was his adopted son; and the other, the appointment of Gemellus, the son of Drusus, who was his son by nature. The former was of mature age, being now twenty-five, and possessed of popular favour. The dissimulation of this aspirant to the empire had not eluded the penetration of Tiberius. See CALIGULA.

Tiberius, leaving Capreae, frequently changed his abode, and at last stopped at a country-house, which had belonged to Lucullus, near the promontory of Misenum. There, on March 16th, A.D. 37, he sunk into a state, in which he appeared dead; upon which Caius, with indecorous precipitance, proceeded with a numerous escort to seize possession of the empire: but his revival threw them all into confusion. At this instant Macro, the pretorian prefect, caused him to be suffocated with pillows. He died in the seventy-eighth year of his age, and twenty-third of his reign, universally execrated; and his predominant vices were such, that they have almost effaced the records of his laudable qualities. Tacitus. Suetonius. Crevier.

TIBERIUS CONSTANTINE, emperor of the East, was a Thracian by birth, and by office captain of the guards to Justin II. By the recommendation of the empress Sophia, he was raised to the rank of Cæsar A.D. 574, and in 578, when Justin died, succeeded to the imperial throne. Sophia, attached to his person, had flattered herself with the hope of his being her second husband; but on his accession to the empire, it appeared that he had been previously married to Anastasia, who was proclaimed Augusta. Sophia, thus disappointed, concurred in a conspiracy for raising to the purple Justinian, commander of the eastern army; but the plot being discovered, Sophia was punished by losing the greatest part of her allowance. The government of Tiberius has been favourably represented. He was temperate, just, and humane; economical in the disbursement of the revenue, yet liberal and beneficent, and ready to remit the dues of taxation to sufferers under public calamity. The principal events of his reign were two victories over the Per-

sians. Soon after the second victory, Tiberius fell into a disease, during which he declared Maurice, who had married his daughter Constantia, and who had been nominated Cæsar, his successor: and after a reign of four years, he closed his life in 582, with the general regret of his subjects. Anc. Un. Hist. Gibbon's Rom. Emp.

TIBESTI, in *Geography*, a town of Africa, on the route from Fezzan to Bornou, inhabited by the people called *Tibbo* (which see); 150 miles S.E. of Mourzouk. The vales of Tibesti are fertile in corn, and pasturage for cattle, of which they have numerous herds; and they are particularly celebrated for their breed of camels, which are esteemed the best in Africa. For this fertility they are indebted to the water of the innumerable springs, that amply compensate for the want of rain, which seldom, if ever, falls within the limits of Tibesti. Among the natives of Tibesti, different religions are professed; for some of them are Mahometans, and others continue attached to their ancient system of idolatry. From the plain, which lies to the W. of the desert of Tibesti, a part of the mountains of Tibesti take their rise. These vast hills, the range of which is very extensive, are variously peopled: but such of them as are crossed on the route from Fezzan to the city of Bornou, are inhabited by a mixture of Musulmen and idolaters, who employ themselves in breeding camels and asses, and other cattle, particularly horses of a small size.

TIBET. See THIBET.

TIBI, a town of Arabia, in the country of Oman; 8 miles N. of Kalhat.

TIBIA, in *Anatomy*, the large bone of the leg. See EXTREMITIES.

TIBIA, *Fractures of the*. See FRACTURE.

TIBIA *Biceps*. See BICEPS.

TIBIA, in *Music*, was originally a flute, made of the flank or shin-bone of an animal; and when the art of boring flutes was discovered, they were made of box-tree, laurel, brass, silver, and even of gold. See FLUTE.

TIBIA *Articularis*. See BAGPIPE.

Dr. Burney (*Hist. Mus. vol. i. p. 521.*) apprehends that the union of this instrument with the syrinx suggested the first idea of an organ.

TIBIÆ *Pares et Impares*, in the *Dramatic Music of the Ancients*. It has been long doubted, whether *pares* and *impares* meant double and single flutes, or equal and unequal in point of length and size. But though in preferring either of these acceptations, some sense and meaning is acquired, yet we should incline to the latter. For in none of the representations in ancient painting or sculpture, which we have yet seen, does it appear that the tibicen, either at sacrifices or in the theatre, plays on a single flute, though we as often see double flutes of different lengths in his hands, as of the same length; and as harmony, or music in different parts, does not appear to have been practised by the ancients, the flutes of *equal* length may naturally be supposed to imply unisons; and *unequal*, such as are octaves to each other.

TIBIALIA, among the Romans, a kind of swaths with which they used to cover their legs.

TIBIALIS, in *Anatomy*, a name applied to various organs situated in the neighbourhood of the tibia. There is an anterior and a posterior tibial artery, an anterior and posterior tibial nerve (see ARTERY and NERVE), and the two following muscles.

TIBIALIS *Anticus*, jambier antérieur, tibio-fus-tarsien; an elongated muscle, flattened at the sides, placed on the front of the leg, and extending from the upper end of the tibia to the first cuneiform bone. It is covered in front by the

the aponeurosis of the leg, to which it adheres closely at the upper part: the anterior surface of the muscle forms the convexity on the outside of the tibia, which is more considerable in strong muscular subjects. The inner flat surface corresponds to the outer or concave surface of the tibia, and is attached to its upper half: the outer surface corresponds above to the extensor longus digitorum pedis, below, to the extensor longus pollicis pedis: the anterior tibial vessels and nerve being interposed. The posterior edge of the muscle is attached to the upper three-fourths of the interosseous ligament, then it lies on the front of the tibia, on the ankle joints, and on the upper and inner part of the tarsus. The upper extremity of the muscle is fixed to the front of the external tuberosity of the tibia; thence it descends parallel to the tibia, first increasing in size, then diminishing again, and ending about the lower third of the leg in a thick and flat tendon, which descends over the front of the tibia, and of the ankle, confined by the superior annular ligament of the tarsus. (See FASCIA.) Having passed this ligament, the tendon passes forwards on the foot, then turns obliquely inwards, becoming a little broader, over the convexity of the first cuneiform bone, and divides into two portions. The posterior, which is the largest, is fixed to the inner and front part of the basis of that bone; the anterior and smaller is attached to the posterior extremity of the first metatarsal bone.

The lower part of the tibialis anticus consists of a strong tendon, which enters the substance of the muscle, and expands into an aponeurosis reaching nearly to the upper end of the muscle. The fleshy fibres arise from the fascia of the leg, from the external surface of the tibia, from the interosseous ligament, and from an aponeurotic septum between it and the extensor longus digitorum. They pass obliquely to both surfaces of the tendon, like the barbs on the shaft of a feather, and are continued much lower on its posterior than on the anterior surface.

It bends the foot on the leg, and turns the point inwards: it elevates at the same time the whole internal edge of the foot. It brings the leg forwards on the foot, and maintains it in that position.

TIBIALIS Posterior, jambier postérieur, tibio-sous-tarsien, is a long narrow muscle, thicker above than below, placed at the back of the leg, under the calf, and extending from the upper part of the tibia and fibula to the os naviculare. It is covered behind by the soleus, by the flexor longus digitorum and pollicis pedis. In front it is attached to nearly the whole posterior surface of the interosseous ligament, and above, to the posterior surface of the tibia. On the outside it is fixed to the fibula. Its upper extremity is divided into two portions, an external and smaller attached to the fibula, an internal larger to the tibia and interosseous ligament; they are separated by an interval, through which the anterior tibial artery passes. The muscle descends parallel to the bones of the leg, and arcuated between them, becoming larger to its middle, from which it again diminishes; towards the lower part of the leg it forms a strong tendon, which runs in a groove hollowed in the external malleolus, and surrounded by a fibrous sheath, which separates it from the flexor longus digitorum. In this groove the tendon becomes broader: it passes below the head of the astragalus, swelling into a hard and nearly bony substance, and is attached to the lower and inner part of the os naviculare, and to the basis of the first cuneiform bone. The inferior tendon ascends into the muscle, expanding into an aponeurosis, in which the fleshy fibres are inserted obliquely on all sides from the fibula, the tibia, the interosseous ligament, and the aponeurosis, which covers it

from the flexor longus digitorum. It extends the foot on the leg, turning the sole and point a little inwards. It will carry the leg backwards on the foot, when that is fixed.

TIBICEN, in *Ancient Music*, a flute-player.

TIBICEN, in *Ichthyology*, a fish of the *trigla* kind, called by many authors *lyra*, or the *harp-fish*; and in some parts of England, the *piper*.

The head of this fish runs out into two broad horns, which are serrated, or beset with a sort of teeth, or small spines, all along their edges, which is its principal distinction from the hirundo or swallow-fish. Above the gill-fins it has on each side a long and sharp spine. The forehead is elevated into a sort of eye-brows over the eyes: and at the angles of these there are small and short spines, which are long and crooked. The side lines feel but very little rough to the touch, and the forehead between the eyes is not hollowed. The whole head is covered with a bony crust, which runs into two horns or spines behind. It has three fingers or filaments on each side, from the roots of the gill-fins; and its jaws are rough like files, but have no distinct teeth. The tail-fin, and the middle of the back, in this fish, are red. It is caught in the Mediterranean, and in some other seas. In our county of Cornwall it is not unfrequently caught about the shores, and from the noise it makes, when taken out of the water, is called the *piper*. Ray and Willughby.

TIBIGENSE OPPIDUM, in *Ancient Geography*, a town of Africa Propria, according to Pliny; called Thigiba by Ptolemy.

TIBIGI, in *Geography*, one of the rivers of the Brazils, which flow into the Parana, rich in diamonds, as the few families that live in its vicinity have reason to remember with gratitude. West of this river and of Corritiva, it is dangerous to land, since in that direction are found the Anthropophagi, who were driven from these boundaries at a very recent period. The country to the N. abounds with wood.

TIBILIS, in *Ancient Geography*, a place of Africa, distant 10 leagues S.W. from Hippo Regius, and 16 miles E. of Cirta; where are many ruins.

TIBISCA, a town of Lower Mæsia. Ptol.

TIBISCUM, one of the most considerable towns of Dacia. Ptol.

TIBISCUS, a river of Dacia, which ran into the Danube.

TIBISIS, a large river, which rose in mount Hæmus, and pursuing a north course, discharged itself into the Ister.

TIBIUM, a mountain of Asia, in Phrygia.

TIBOELALE, in *Geography*, a town on the S. coast of the island of Ceram. S. lat. 3° 19'. E. long. 128° 45'.

TIBOUCHINA, in *Botany*, an unexplained barbarous name, Aubl. Guian. 445. t. 177. Juss. 329. The shrub which bears it is suspected by Schreber to be a species of MELASTOMA. (See that article.) We see no reason to question this, though Aublet describes the fruit as a dry capsule; for the known *Melastoma* differ greatly in the degree of pulp in their berries, especially according to the period at which they are examined.

TIBOULEN, in *Geography*, a small island in the Mediterranean, near the coast of France. N. lat. 43° 15'. E. long. 6° 24'.

TIBOURBOU, in *Botany*, the Caribbean name of a fine tree of Guiana and Cayenne, called *Apeiba Tibourbou* in Aubl. Guian. 538. t. 213. See **AUBLETIA** and **SLOANEA**.

TIBRACANA, in *Ancient Geography*, a town of Asia, in the interior of Media. Ptol.

TIBULA, or **TIBULÆ**, a town situated on the northern coast of the island of Sardinia. Ptol. Iter. Anton.

TIBULLUS, ALBIUS, in *Biography*, a Roman poet of the Augustan age, of the equestrian rank, whose native place and time of birth are not ascertained. His patrimony was much impaired, either by his own prodigality, or by the devastation of several wars; but yet he does not seem to have been distinguished by any tokens of the liberality of Augustus and Mæcenæ, the munificent patrons of literature at the period in which he lived; nor does he mention their names in any of his poems. M. Valerius Messala Corvinus, upon whom he composed a panegyric, was his particular friend and patron, whom he accompanied in his expeditions to Asia; but he preferred peace and retirement in the society of one of those objects of his affection whom he has celebrated in his elegies. Horace, with whom he was intimate, has addressed to him an ode and an epistle, complimenting him as a candid judge of his writings, and describing him as possessed of every worldly advantage. It has been inferred, from an epigram of Domitius Marsus, that he died about the same time with Virgil, B.C. 19, in the flower of his age. Ovid lamented his death in a beautiful elegy, representing his mother and sister as mourners at his funeral, and speaking of him as a poet of the highest reputation.

The poems of Tibullus are elegies comprised in three books, and a panegyric of Messala. His fame is founded on his elegies, which are described by one of his biographers as occupying, by the testimony of ancient and modern critics, the first class of such compositions with regard to "the appropriate qualities of elegance, tenderness, and that beautiful simplicity, which is the character of real feeling." Their principal subjects are "love and rural life." With his description of a passion which is illicit, he has blended "more touches of a pure, and what may be termed a conjugal affection, than almost any other Roman poet. His language is a true example of what the Latins call *terse*, or neat and polished. He is easy and natural, with scarcely any mixture of learned allusion or figure." His works are usually printed with those of Catullus and Propertius; but of the separate editions, the most esteemed are those of Brookhusius, Amst. 1708, 4to.; of Vulpius, Patav. 1749, 4to.; and of Heyne, Lips. 1755, 1777, 8vo. Gen. Biog.

TIBUR, TIVOLI, in *Ancient Geography*, a town of Italy, near the Anio, N.E. of Rome, in the country of the Sabines. Pliny refers its origin to the age which preceded the siege of Troy, and says that its founder was Tiburnus, one of the sons of Amphiarius, assisted by his two brothers, Catille and Corax. This Tiburnus was regarded after his death as a god; and was worshipped in a wood consecrated to him, and where a temple was erected to his honour. But Dionysius Halicarnassensis pretends that it was built by the Siculi, before this epocha. For its situation, and some other circumstances attending it, we refer to the article **TIVOLI**.

Horace has described in a few lines the beauties which he admired in contemplating this ancient city, Od. 7. lib. i. "Nothing," says the poet, "struck me so much as the house of the resounding Albunea, the lofty cascade of the Anio, the sacred wood of Tiburnus, and the gardens irrigated by unintermitting supplies of water." The "domus Albunæ resonantis" of the poet was the solfatara or sulphureous abyss of the place, probably the crater of some ancient volcano, which perpetually discharged a kind of gas or

mephitic vapour, that was thought to possess a sanative quality, and to be a remedy for many disorders. Many persons resorted hither for relief; and Suetonius informs us, that Augustus also came for the benefit of the baths which the place afforded. These benefits were ascribed to imaginary deities, who were thought to preside over this privileged spot. Accordingly, a monument has been discovered, which indicated that Hygeia, the goddess of health, was worshipped here. The vapour possessed also a kind of inspiring quality, so that here was a temple of the Muses; and also, besides various other monuments, a temple in which was an oracle. Virgil informs us how this oracle was consulted. The "præcepta Anio" of Horace refers to the cascade of this river. The gardens and vineyards have to this day retained their celebrity; the wine of this canton being held in high estimation.

Tibur was also famous for its temple of Hercules, which had its college of priests and curator; a beautiful portico, where, according to Suetonius, Augustus administered justice when he resided here; and an excellent library of which Aulus Gellius speaks in his "Noctes Atticæ." Tibur had also a temple of the Sibyl, much admired for its elegance. This place was also famous for other monuments, now in ruins. Towards the end of the Roman republic, the adjoining territory was selected for superb buildings and houses of various kinds, all distinguished by their magnificence and beauty. Of these, the Tiburnus of Adrian was the most celebrated.

TIBURO, in *Ichthyology*, a fish very badly and falsely described by several authors, and proving, on a strict inquiry, to be no other than the lamia or white shark.

The tiburo of Linnæus is a species of squalus, with a very broad and heart-shaped head, found in the American seas. Linnæus queries, whether it is not a variety of the *zygæna*, or hammer-headed shark.

TIBURON, in *Geography*, a town and bay on the S.W. coast of Hispaniola, near Cape Tiburon.—Also, a small island in the Pacific ocean, discovered by Magellan in 1520. It is variously laid down in maps. S. lat. 9°, 13°, 14°, 15°, and 17°.

TIBURONES, or *Main Cape Reef*, two small islands, surrounded with rocks, near the coast of Honduras. N. lat. 15° 10'. W. long. 82° 8'.

TICADEE, a town of Hindoostan, in the circle of Ruttunpour; 15 miles N. of Dumdah.

TICAL, in *Commerce*, a weight for gold and silver, and also a money of account in certain parts of the East Indies, particularly at Pegu and Siam. At Pegu, the weight of silver, under this denomination, is divided into 16 toques or touch. Gold and silver are here weighed by the tical, and their fineness is expressed by the parts called touch. The tical weighs $4\frac{1}{2}$ pagodas, or $237\frac{1}{2}$ English grains. The commercial weights are the vis of 100 ticals or tuals, and the candy of 100 vis. From the above weight of the tical, the candy should weigh $508\frac{1}{2}$ lbs.; nevertheless the English reckon it at 6 maunds 28 seers of the Bengal factory, or 500 lbs. avoirdupois.

At Siam, the accounts are kept in catties, tales, ticals or tuals, miams, fouangs, and cowries. The catty is = 20 tales, the tale = 4 ticals = 16 miams = 32 fouangs; and the fouang is = 800 cowries. The coins are gold ticals, which pass for ten silver ticals; silver ticals, miams, fouangs, and somepias, the latter being the fourth part of a fouang. The silver tical weighs $225\frac{1}{2}$ English grains, and being from 11 oz. 4 dwt. to 11 oz. 12 dwt. fine, is worth from 29d. to 30d. sterling; but these coins are often adulterated; 2 ticals pass commonly for 1 Spanish dollar, and $2\frac{1}{2}$ ticals for 1 Dutch

1 Dutch ducatoon. The fineness of gold and silver is expressed by toques or touch, the weight being divided into 100 parts. The pecul, or weight for heavy goods, is = 50 catties, and the catty = 20 tales = 80 ticals. The Siam pecul weighs 129 lbs. avoirdupois, and the catty, 41 oz. $4\frac{1}{2}$ dwt. avoirdupois.

TICANONA, TACONA, *Jeanona* or *Jeatona*, in *Ancient Geography*, a town of Egypt, between Cene and Oxyrynchon. Itin. Anton.

TICAO, in *Geography*, one of the Philippine islands, about 25 miles long, and from 3 to 8 broad. N. lat. $12^{\circ} 39'$. E. long. $123^{\circ} 34'$.

TICENA, in *Ancient Geography*, a town of Africa Propria, S. of Carthage, between the rivers Bagradas and Triton, Ptol.

TICENGO, in *Geography*, a town of Italy, in the department of the Upper Po; 6 miles E. of Crema.

TICHASA, TE-GEWSE, in *Ancient Geography*, a town of Africa Propria, S. of Carthage, between the rivers Bagradas and Triton, 12 leagues S.W. of Capfa: in which are some vestiges of the Romans. Ptol.

TICHENBRAY, in *Geography*. See TINCHEBRAY.

TICHFIELD, a village of England, in the county of Hants, situated on a river which runs into the Southampton Water. Here Charles I. concealed himself, when he fled from Hampton-Court, in the year 1674, at a seat of the earl of Southampton. This seat had been an abbey, and is said to be the place where the marriage of Henry VI. with Margaret of Anjou was solemnized; 8 miles N.W. of Gosport.—Also, a town of Jamaica, on the N. coast; 22 miles N.E. of Kingston. N. lat. $18^{\circ} 12'$. W. long. $76^{\circ} 10'$.

TICHIS, in *Ancient Geography*, a river which flowed from the Pyrenees, now *Tech*, in the department of the Eastern Pyrenees.

TICHIUM, a town of Greece, in Etolia. Thucydides.

TICHOS, or TICHUS, a fortress of Achaia, in the eastern part to the S. of the promontory Araxum.

TICINDLO, or *Naviglio Grande*, in *Geography*, a canal made from the river Tesino to the city of Milan, by order of Francis I. king of France.

TICINUM, PAVIA, in *Ancient Geography*, a town of Transpadane Gaul to the S.W. upon the river Ticinus, or near it. After the second Punic war, it attained the rank of municipal. Odoacer, king of the Heruli, destroyed it, and it was rebuilt under the name of Pavia, whence the name Pavia.

TICINUS, TESIN, a river of Transpadane Gaul, which commenced in the country of the Lepontii, traversed the lake Verbanus, and discharged itself into the Po, near Ticinum. It is celebrated for a battle of the same name, between the Romans, conducted by Cornelius Scipio, the father of Scipio Africanus, and the Carthaginians, conducted by Hannibal, in the year of Rome 535, in which the Romans were defeated.

TICK, in *Natural History*, a nasty little animal of a livid colour, with a blunt and roundish tail, elevated antennæ, a globose-ovate form, and full of blood; which infests cows, swine, goats, sheep, and dogs. The tick or ricinus is, in the Linnæan system, a species of *acarus* in the *aptera* order of insects.

In order to destroy and remove these noxious vermin, which spread very rapidly in sheep, it has been recommended to separate the wool, and to wash the diseased spots two or three times, or oftener, if necessary, with a liquid preparation, consisting of one ounce of cream of tartar, and a

quarter of a pound of bay-salt, each finely powdered and sifted, and one ounce of corrosive sublimate, reduced into the same state; the whole being well dissolved and mixed together in two quarts of soft water: or four pounds of soft soap, and two pounds of arsenic, may be steeped and dissolved in thirty gallons of water, and the animals be immersed in the infusion or solution, the heads of them being carefully kept above water, and the sheep being sheltered from rain for one or two days afterwards. The wool must be closely pressed, and the liquor that runs off be caught in a tub, or other vessel, for future use. The proportion above specified, is sufficient to bathe or wash forty lambs, or the same number of small sheep; and sometimes many more.

But the preparation which is in use at Holkham-Hall, in the county of Norfolk, for this purpose, consists of two pounds of tobacco, two pounds and a half of soft soap, and one pound of the white calx of mercury, well reduced into powder; the whole being boiled in eight gallons of water for an hour. This is a quantity sufficient for dressing sixty sheep, being applied by parting the wool down the shoulders and breast, and twice on each of the sides of the sheep, then pouring it in very carefully so as to prevent its being wasted. It is said to be very effectual not only in destroying the vermin, but in removing the scabby sores that are produced.

It is stated in a paper in the third volume of the "Transactions of the Highland Society of Scotland," that the tick, or *acarus reduvius*, is a distinct species or sort of vermin of this kind from that of the kid, or *hippobosca ovina*, the former of which harasses the lambs and trembling sheep in the spring season, while the latter molests all sorts and ages, but particularly hogs or young sheep, and chiefly such as are in a lean state. The former always adheres close to the bare spots of the shoulders, thighs, or ears, draining and drawing away the blood from them; and for the most part drops off about midsummer: but the latter harbours in the wool, bites the sheep, and sucks their blood. Smearing with tar, it is said, expels it from the skin, and it soon afterwards drops from the wool. Tobacco-juice is fatal to it almost instantaneously, and mercurial ointment destroys it. The former, or tick, is removed by the same remedies as the kid, and it is wholly prevented by having the young sheep in good condition. This distinction, in some cases, may be of considerable use to the sheep-farmer in the destruction and removal of such hurtful vermin.

TICK, in the *Manege*, a habit that some horses take of pressing their teeth against the manger, or all along the halter or collar, as if they would bite it.

TICK-Bean, or Ticks, in *Agriculture*, a term commonly applied to the small bean employed in the feeding of horses and other animals; of which there are several kinds, as the common ticks, the large flat ticks, the small or Essex ticks, and the French ticks. The first is a sort which is small and very commonly cultivated, but most generally by the farmers of Kent, where they are used for the fattening of hogs, and as food for horses, especially those of the team kind. The second is a larger sort than the common, and ripens somewhat more early. They are very productive in some cases; but from being larger in size, they of course are less heavy, and consequently of rather less value the quarter or any other measure. They are sometimes called May beans. The Essex ticks are a much smaller sort than the common, and of a rounder shape or form. They ripen a few days later, and are not so productive, but are more valuable, as being heavier in proportion. The last sort, or small French ticks, are a still less kind, being only about as large as a middling-sized pea, and nearly circular. They ripen later than

than any of the other sorts, but are the most valuable when dry, on account of their great weight.

Ticks are an important article of cultivation in moist places, where the land is suited to their growth; and though they have been for a long time, and are at present, almost wholly confined to the counties of Essex and Kent, they may be raised in many other districts with equal success and advantage.

TICKARRY, in *Geography*, a town of Hindoostan, in Bahar; 15 miles N.W. of Gaya. N. lat. $24^{\circ} 58'$. E. long. 85° .

TICKELL, THOMAS, in *Biography*, an English poet, was the son of a clergyman in Cumberland, and born at Bridekirk, near Carlisle, in the year 1686. He was admitted at Queen's college, Oxford, in 1701; and in 1707 he published a poem, entitled "Oxford," and inscribed it to lord Londale, expressing his gratitude to that university. In 1708 he took his degree of M.A., and two years after was elected a fellow of his college, under a dispensation from the crown against the statute which required him to be in orders. With a view of advancement by the exercise of his literary talents, he came to the metropolis, and ingratiated himself with Addison by an elegant copy of verses in praise of his opera of Rosamond. He contributed to the periodical publications of the "Spectator" and "Guardian," in the latter of which, all the papers on pastoral poetry, except one by Pope, are ascribed to him. During the negotiations which terminated in the peace of Utrecht, he published a very popular poem, entitled "The Prospect of Peace," which was highly commended by Addison, in return for which commendation he wrote his lines on the "Cato" of that author. On the accession of the Hanover family, to which he was attached, he presented George I. on his arrival with a piece called "The Royal Progress;" and he served the cause still more effectually by two satirical poems on the Jacobite party, viz. "An Imitation of the Prophecy of Nereus," and "An Epistle from a Lady in England to a Gentleman at Avignon." Tickell accompanied Addison to Ireland, and was there initiated in public business with a view to future preferment. On occasion of Pope's publication of the first volume of his translation of Homer's Iliad, Tickell published a translation of the first book of that poem, which was patronised by Addison, so as to occasion an interruption of his friendship with Pope. When Addison was made secretary of state, Tickell was under-secretary, and continued in office under his successor Craggs. On the death of Addison, Tickell was entrusted with the charge of publishing his works, to which he prefixed a valuable life of the author. In 1725 he was appointed to the lucrative post of secretary to the lords-justices of Ireland, and retained it till his death, which happened at Bath in 1740. Tickell had been married and left a family.

Tickell is ranked by his biographers among English poets of the second order; equalled by few of his contemporaries in eloquence of diction and harmony of versification, and without lofty flights maintaining a decent elevation by a cultured style, and by just and ingenious thoughts. His funeral poem on Addison is pronounced by Dr. Johnson to be more sublime and elegant than any that is to be found in the whole compass of English literature. His "Ode to the Earl of Sunderland," and his "Colin and Lucy," are highly commended.

Richard Tickell, esq. a grandson of this poet, who was a commissioner of the stamp-office, has been known to the literary world by his "Wreath of Fashion," and especially by an effusion of political art and satire, entitled "Anticipations of the Debates of the House of Commons," 1778.

He died at Hampton Court in 1793. Johnson and Anderson's Lives of the Poets. Gen. Biog.

TICKELY, in *Geography*, a town of Hindoostan, in the circar of Cicacole; 30 miles N.E. of Cicacole. N. lat. $18^{\circ} 36'$. E. long. $84^{\circ} 34'$.

TICKERA, a paste which is prepared in Fezzan from dates and the meal of Indian corn, and which, whenever they travel, is in great request among the people of Fezzan.

TICKEREE, in *Geography*, a town of Hindoostan, in Oude; 48 miles N.E. of Manickpour.

TICKHILL, a market-town in the lower division of the wapentake of Strafford-and-Tickhill, in the West Riding of the county of York, England; is 4 miles W. from Bawtry, 7 miles S. from Doncaster, and 154 miles N. by W. from London. The houses are placed in a valley, and cover a large space of ground. Some of them are of brick, and others of stone: a few of them are respectable, but the more numerous have only a mean appearance. A market is held on Fridays, but is nearly fallen into disuse. A fair is kept annually for horses, horned cattle, and sheep. The population return of the year 1811, states that Tickhill contained 1508 inhabitants, who occupied 279 houses. The objects most worthy of attention are the church, and the remains of an ancient castle. The former is a spacious edifice, with a lofty and beautiful tower, and from its architecture seems to have been built in the reign of Henry III. The castle, of which nothing now remains but the lofty mound on which the keep formerly stood, with a ditch and part of the walls surrounding the fortrefs, is situated on the south side of the town. An ancient gateway, forming the entrance on the western side, is the most curious part of the ruins. Part of these, with modern repairs and additions, is the seat of the honourable Frederick Lumley. A great part of the ground within the walls is converted into gardens and shrubberies. The steep declivity of the mound is formed into winding walks, leading by a gentle ascent to the summit.

The history of Tickhill prior to the Norman conquest is wholly unknown. It appears to have been one of the forty-nine manors given by the Conqueror to Roger de Busli, who probably erected and resided in the castle. It was afterwards successively held by several noblemen, till Richard II. gave it to his uncle, John of Gaunt, duke of Lancaster, from whom it passed to the crown by the succession of Henry IV. In the year 1644 the castle was regarded as a very strong fortrefs, and was garrisoned for Charles I.; but being surrendered to the parliament, an order was issued that it should be dismantled and rendered untenable. The circular keep was in consequence demolished, but the foundations may still be traced by opening the ground. A royal free chapel or collegiate church was founded in the castle by queen Eleanor, wife of Henry II. It was given by king John to the prebends of the cathedral church of Rouen in Normandy. It was afterwards granted to the prior and convent of Lenton, Nottinghamshire; and in 1504 to the abbot and convent of St. Peter, Westminster. After the dissolution it was given by Edward VI. to Francis, earl of Shrewsbury.

About two miles and a half from Tickhill is Sandbeck, the seat of the earl of Scarborough. The mansion, built by the late earl, is a large and commodious edifice, seated in a spacious park, which abounds with forest trees; and is adorned with an extensive lake. Near the western verge of the park, are the venerable and picturesque ruins of Roche abbey, which was founded in the year 1147, for monks of the Cistercian order. Here is a famous quarry, from which the

the stone for building the abbey, and for many other public edifices, was obtained.

About five miles nearly S. from Tickhill is Walding Well, the seat of Sir Thomas White, bart. The house is a modern edifice, situated in a well-wooded park of considerable extent, and stands partly in Yorkshire and partly in Nottinghamshire; a small rivulet, which runs under a part of the out-buildings, forming the boundary between the two counties. In the park was formerly a priory of nuns, called St. Mary in the Park, founded by Ralph de Cheurolcourt. This religious house appears to have stood within the limits of Nottinghamshire.—*Beauties of England and Wales*, vol. xvi. Yorkshire; by J. Bigland.

TICKING, or TICHING, in *Husbandry*, denotes the act of setting up turfs in such a manner as that they may be dried by the sun, and fit for being burnt into ashes on the land.

TICKLE HARBOUR, in *Geography*, a harbour on the E. coast of Newfoundland.

TICKLE *me* Quickly, a bay on the coast of Darien, near the Samballas.

TICKLISH, in the *Manege*. A horse is said to be ticklish that is too tender upon the spur, and too sensible, that does not freely fly the spurs, but in some measure resists them, throwing himself up when they come near and prick his skin. A ticklish horse has somewhat of the ramingues, *i. e.* the kickers against the spurs; but with this difference, that the latter put back, leap, and kick, and yerk out behind, in disobeying the spurs; whereas a ticklish horse only resists for some time, and afterwards obeys, and goes much better, through the fear of a vigorous ham, when he finds the horseman stretch his leg, than he does upon being actually pricked.

TICKSAH, in *Geography*, a river of America, in the Mississippi territory, which rises 10 miles N.E. of the forks of the Amite, and when it enters West Florida, is a creek of trivial size; it then becomes gradually augmented by several creeks, and after a S. course of 10 miles, falls into lake Maurepas, 4 miles N.E. of the mouth of Amite. Three miles above its mouth the Tickfah receives from the E. the united streams of the Notalbany and Pontchatoola, upon the latter of which stands Springfield, on the road from Madisonville to Natchez. Springfield is one of the landing places of travellers, who pass in schooners from New Orleans to Natchez. The above-mentioned Amite rises within the Mississippi territory, about 20 miles N. of the town of Liberty, in Amite county. The two streams that constitute the Amite, remain separate in their course through the Mississippi territory, but unite immediately on entering West Florida, and then it joins the Iberville, and falls after a whole course of 100 miles into the lake Maurepas. Below the junction of Amite and Iberville, the united streams form a fine navigable river, admitting vessels of six feet draught.

TICKSEED-SUN-FLOWER. See COREOPSIS, and SUN-FLOWER.

TICOLEA, in *Geography*, a town of Hindoostan, in Bahar; 7 miles N. of Bettiah. N. lat. 26° 55'. E. long. 84° 38'.

TICOLOOSA, a town of the United States of America, in Tennessee; 38 miles S. of Knoxville.

TICONDEROGA, a township of Essex county, in the state of New York, erected in 1804. It is bounded N. by Crown Point, E. on lake Champlain, S. by Washington county, W. by Scroon, and includes the N. end of lake George. Mount Defiance is in the S. part of this township. In 1810 it had about two hundred families, and thirty-five senatorial electors: seven saw-mills, three grain-

mills, three forges, three carding-engines, and some other machines, and three school-houses. Here is also a broom machine, in which, by means of machinery moved with water, one man makes a hundred brooms a day. The inhabitants are mostly farmers.

In this township stands the fortress of Ticonderoga, now a heap of ruins. It was built by the French in 1756, on a point of land formed by the junction of lake George creek with lake Champlain, in N. lat. 43° 50', and 34' E. long. from New York. It was, both by nature and art, a place of great strength. On three sides it is surrounded by water, and about half the other side is occupied by a deep swamp, and the line of defence was completed by the French with the erection of a breast-work nine feet high, on the only available ground. In 1758, general Abercrombie with the British army unsuccessfully assailed this fortress, and with the loss, as it is said, of 1041 men; but in July of the following year it was surrendered to general Amherst. It was the first fortress carried by the arms of America, in their contest for independence; being taken by surprise by general Allen, May 10, 1775, and retained till July 1777, when it was evacuated at the approach of general Burgoyne with the British army. This fort is never likely to be rebuilt; for the situation is very insecure, being commanded by the lofty hill called Mount Defiance. Mount Independence lies on the E. side of the lake, about two miles S.E. of the fort, between which two places there is a well-regulated ferry. The population of the township, in 1810, consisted of 985 persons.

TICOO, a town on the W. coast of Sumatra, near the Line. E. long. 99° 21'.

TICOO *Islands*, a cluster of small islands near the W. coast of Sumatra. S. lat. 0° 6'. E. long. 99° 13'.

TICORANTE, a town of the island of Teneriffe.

TICOREA, in *Botany*, a name of Aublet's. See OZOPHYLLUM.

TICOS, in *Geography*, a small island in the Pacific ocean, near the E. coast of the island of Luzon. N. lat. 14° 10'. E. long. 124°.

TICOUL HOTUN, a town of Corea; 450 miles E.N.E. of Peking.

TICOUR, a town of France, in the department of the Moselle; 6 miles N.W. of Morhange.

TICSAN, a town of Peru, in the jurisdiction of Cuenca.

TICUARIN, the name of the island of Goa, before the city was built.

TICUNAS, *Poison of*, is an active poison prepared by the native Indians, on the borders of the river of the Amazons, in three or four degrees of south latitude, which, together with that of Lamas, Pevas, and Yameos, is extracted by fire from plants, called by the French lianes, and used in poisoning their arrows. See an account of the nature and effects of these poisons by M. Herissant, in Phil. Transf. vol. xlvii. art. 12. and by M. Fontana, in Phil. Transf. vol. lxx. part i. Append. art. 2.; and also Fontana sur les Poisons, &c. Florence, 4to. See also POISON.

TIDE, or TIDI, in *Geography*, a river of England, which passes by St. Germans, and runs into the Hamoaze below Saltash.

TIDE, the same with time, or season. The word is originally Saxon, *tid*; which signifies the same.

TIDE, among *Miners*, denotes the space of twelve hours.

TIDE, *Sbroue*. See SHROVE.

TIDE, *Twelfth*. See TWELFTH.

TIDE, *Whitsun*. See WHITSUN-TIDE.

TIDES, two periodical motions of the waters of the sea; called also the *flux* and *reflux*, or the *ebb* and *flow*.

When the motion of the water is against the wind, it is called a *windward-tide*: when wind and tide go in the same direction, *leeward-tide*: when it runs very strong, it is called a *side-gate*.

To *ride it over or up* into any place, is to go in with the tide, either ebb or flood, as long as that lasts; then to stay at anchor all the time of contrary tide; and thus to set in again with the return of the next tide.

It is said to *flow-tide* and *half-tide*, allowing six hours to a tide, when the tide runs three hours in the offing longer than it does by the shore; but, by *longer*, they do not mean its running more hours; but that, if it be high water a-shore at twelve, it will not be so in the offing till three. An hour and a half longer make tide and quarter-tide, three-fourths of an hour longer make tide and half-quarter tide, &c.

When the moon is in the first and third quarter, *i. e.* when she is new and full, the tides are high and swift, and are called *spring-tides*: when she is in the second and last quarter, the tides are lower and slower, and called *neap-tides*.

TIDES, *Phenomena of the*. The sea is observed to flow, for certain hours, from south towards north; in which motion, or flux, which lasts about six hours, the sea gradually swells: so that, entering the mouths of rivers, it drives back the river-waters toward their heads, or springs.

After a continual flux of six hours, the sea seems to rest for about a quarter of an hour; after which it begins to ebb or retire back again from north to south, for six hours more; in which time, the water sinking, the rivers resume their natural course. Then, after a seeming pause of a quarter of an hour, the sea again begins to flow, as before; and thus alternately.

Thus does the sea ebb twice a day, and flow as often; but not in the same hours. The period of a flux and reflux is 12 hours 50½ minutes; so that the tides return later and later each day by 50½ minutes, which is the excess of a lunar day above a solar one, since 28½ lunar days are nearly equal 29½ solar ones. So that the sea flows as often as the moon passes the meridian, both the arc above, and that below the horizon; and ebbs as often as she passes the horizon, both the eastern and western point of it.

This farther agreement we observe between the moon and the sea, that the tides, though constant, are not equal; but are greatest, when the moon is in conjunction or opposition to the sun, or at the time of new and full moon; and least, when in quadrature to it. This increase and diminution constitute the *spring* and *neap* tides: the augmentation becomes also still more observable when the moon is in its perigee, or nearest the earth. The lowest as well as the highest water is at the time of the spring-tides: the neap-tides neither rise so high nor fall so low.

Lastly, those tides are the greatest, which happen in the new and full moon, and the time of the equinoxes, while the moon is in its perigee. These tides are often still more increased by the equinoctial winds, which are sometimes so powerful as to produce a greater tide before or after the equinox than that which happens in the usual course, at the time of the equinox itself.

Add, that the same things are observed throughout most of the coasts of Europe; only that the tides are so much the less, and happen the later, as the coasts are the more northerly.

These phenomena of the tides are admirably accounted

for, from the principle of gravitation. All we require to their solution is, that the earth and moon, and every particle of them, mutually gravitate towards each other: the reasonableness of which assumption, see under the article GRAVITY.

Indeed the sagacious Kepler, long ago, conjectured this to be the cause of the tides: "If," says he, "the earth ceased to attract its waters towards itself, all the water in the ocean would rise and flow into the moon: the sphere of the moon's attraction extends to our earth, and draws up the water." Thus thought Kepler, in his *Introductio ad Theor. Mart.* This surmise, for it was then no more, is now abundantly verified in the following theory, first amply deduced by Dr. Halley from the Newtonian principles.

However, we may observe with M. de la Lande (*Astronomie*, vol. iv. Paris, 1781.) that several of the ancients, and among others, Pliny, Ptolemy, and Macrobius, were acquainted with the influence of the sun and moon upon the tides. And Pliny says expressly, that the cause of the ebb and flow is in the sun, which attracts the waters of the ocean; and adds, that the waters rise in proportion to the proximity of the moon to the earth.

TIDES, *Theory of the*.—1. It is obvious, that if the earth were entirely fluid, and quiescent, its particles, by their mutual gravity towards each other, would form themselves into the figure of an exact sphere.

Suppose, then, that some power acts on all the particles of this earth with an equal force, and in parallel directions, the whole mass will be moved by such a power, but its figure will suffer no alteration by it; because all the particles, being equally moved by this power in parallel lines, they will still keep the same situation with respect to each other, and still form a sphere, whose centre will have the same motion as each particle. Upon this supposition, if the motion of the earth round the common centre of gravity of the earth and moon were destroyed, and the earth were left to the influence of its gravitation toward the moon, the earth falling toward the moon would still retain its spherical figure; all the parts being equally carried on, and retaining therefore the same situation with respect to each other. But the effects of the moon's action, as well as the action itself, on different parts of the earth, are unequal, at all places within the angular distance of 79½° from the line passing through the attracting body, either in the nearer or in the remoter hemisphere; those parts, by the general law of gravity, being most attracted which are nearest the moon, and those being least attracted which are farthest from the moon; while the parts that are at a middle distance, are attracted by a mean degree of force; besides, all the parts are not acted on in parallel lines, but in lines directed towards the centre of the moon; and on these accounts the spherical figure of the earth must suffer some change from the moon's action.

Supposing the earth to fall towards the moon, and abstracting from the mutual gravitation of its parts towards each other, and also from their cohesion; it will easily appear, that the parts nearest the moon would fall with the swiftest motion, being most attracted, and that they would leave the centre or greater bulk of the earth behind them in their fall, while the more remote parts would fall with the slowest motion, being less attracted than the rest, and be left a little behind the bulk of the earth, so as to be found at a greater distance from the centre of the earth than at the beginning of the motion. Whence it is manifest, that the earth would soon lose its spherical figure, and form itself into an oblong elliptic spheroid, whose longest diameter would point at the centre of the moon.

TIDES.

If the particles of the earth did not gravitate toward each other, but toward the moon only, the distances betwixt the parts of the earth that are supposed to be nearest the moon, and the central parts, would continually increase, because of their greater celerity in falling; and the distance betwixt the central parts, and the parts that are farthest from the moon, would increase continually at the same time; these being left behind by the central parts, which they would follow, but with a less velocity. Thus the figure of the earth would become more and more oblong, that diameter of it which pointed toward the moon continually increasing.

But there is another reason why the earth would soon assume an oblong spheroidal form, if its parts were allowed to fall freely by their gravity towards the moon's centre; for the lateral parts of the earth, or those which are at the distance of a quarter of a circle from the point which is directly below the moon, and the central parts descending with equal velocities toward the same point, *viz.* the centre of the moon, in approaching to it, would manifestly approach, at the same time, to each other; and their distance becoming less, the diameters of the earth passing through them would be diminished, so that the diameters of the earth that point toward the moon would increase, and those diameters of the earth that are perpendicular to the line joining the centres of the earth and moon, would decrease at the same time, and render the figure of the earth still more oblong for this reason.

Let us now allow the parts of the earth to gravitate towards its centre; and, as this gravitation far exceeds the action of the moon, and much more exceeds the differences of her actions on different parts of the earth, the effect resulting from the inequalities of these actions of the moon, will be only a small diminution of the gravity of those parts of the earth which it endeavoured in the former supposition to separate from its centre, and a small addition to the gravity of those parts which it endeavoured to bring nearer to its centre; that is, those parts of the earth which are nearest to the moon, and those which are farthest from her, will have their gravity toward the earth somewhat abated; whereas the lateral parts will have their gravity increased; so that if the earth be supposed fluid, the columns from the centre to the nearest, and to the farthest parts must rise, till, by their greater height, they be able to balance the other columns, whose gravity is either not so much diminished, or is increased by the inequalities of the action of the moon. And thus the figure of the earth must still be an oblong spheroid.

Let us now consider the earth, instead of falling toward the moon by its gravity, as projected in any direction, so as to move round the centre of gravity of the earth and moon; it is manifest, that the gravity of each particle toward the moon will endeavour to bring it as far from the tangent, in any small moment of time, as if the earth were allowed to fall freely toward the moon; in the same manner as any projectile, at our earth, falls from the line of projection as far as it would fall by its gravity in the perpendicular in the same time. Consequently the parts of the earth nearest to the moon will endeavour to fall farthest from the tangent, and those farthest from the moon will endeavour to fall least from the tangent, of all parts of the earth; and the figure of the earth, therefore, will be the same as if the earth fell freely toward the moon; that is, the earth will still affect a spheroidal form, having its longest diameter directed toward the moon.

In order to understand this theory, it must be carefully considered, that it is not the action of the moon, but the

inequalities in that action, that produce any variation from the spherical figure; and that if this action were the same in all the particles as in the central parts, and operating in the same direction, no such change would ensue.

For the farther illustration of the preceding observations, we must perceive that the waters at Z (*Plate I. Geography, fig. 10.*) on the side of the earth A B C D E F G H, next to the moon M, are more attracted than the central parts of the earth, O, by the moon, and the central parts are more attracted by her than the waters on the opposite side of the earth at *n*; and therefore the distance between the earth's centre and the waters on its surface, under and opposite to the moon, will be increased. For let H, O, and D be three bodies, all equally attracted by the body M, and they will all move equally fast toward it, their mutual distances from each other continuing the same. If the attraction of M is unequal, then that body which is most strongly attracted will move fastest, and this will increase its distance from the other body. Consequently, by the law of gravitation, M will attract H more strongly than it does O, by which the distance between H and O will be increased; and a spectator in O will perceive H rising higher toward Z. In like manner O, being more strongly attracted than D, will move farther toward M than D does; and therefore the distance between O and D will be increased; and a spectator in O, not perceiving his own motion, will see D receding farther from him towards *n*; all effects and appearances being the same, whether D recedes from O, or O from D.

Suppose now there is a number of bodies, as A, B, C, D, E, F, G, H, placed round O, so as to form a flexible or fluid ring; then, as the whole is attracted toward M, the parts at H and D will have their distance from O increased; whilst the parts at B and F, being nearly at the same distance from M as O is, will not recede from one another; but rather, by the oblique attraction of M, they will approach nearer to O. Hence the fluid ring will form itself into an ellipse Z I B L *n* K F N Z, whose longer axis *n* O Z produced, will pass through M, and its shorter axis, B O F, will terminate in B and F. Let the ring be filled with fluid particles, so as to form a sphere round O; then, as the whole moves toward M, the fluid sphere, being lengthened at Z and *n*, will assume an oblong or oval form. If M is the moon, O the earth's centre, A B C D E F G H the sea covering the earth's surface, it is evident that, whilst the earth by its gravity falls towards the moon, the water directly below her at H will swell, and gradually rise toward her; and also the water at D will recede from the centre, (or, strictly speaking, the centre recedes from D,) and rise on the opposite side of the earth; whilst the water at B and F is depressed, and falls below the former level. Hence, as the earth turns round its axis from the moon to the moon again in about 24 $\frac{1}{2}$ hours, this oval of water must shift with it; and thus there will be two tides of flood and two of ebb in that time.

Some persons have found a difficulty in conceiving how, agreeably to the principles above stated, the earth can fall towards the moon by the power of gravity, when the moon is full, or in opposition to the sun; since the earth revolves about the sun, and must continually fall towards it; and if the earth is constantly falling towards the moon, they must at last come together. In order to obviate this difficulty, it has been suggested, that it is not the centre of the earth that describes the annual orbit round the sun, but the common centre of gravity of the earth and moon, the distance of which from the earth's centre, dividing 240,000 miles, the moon's distance from the earth, by 40, the excess of the earth's weight above that of the moon, is 6000 miles; and

that whilst the earth is moving round the sun, it also describes a circle round that centre of gravity, going as many times round it in one revolution about the sun as there are lunations or courses of the moon round the sun in a year; and therefore the earth is constantly falling towards the moon from a tangent to the circle which it describes round the said common centre of gravity. Let M (*fig. 11.*) be the moon, TW part of the moon's orbit, and C the centre of gravity of the earth and moon: whilst the moon goes round her orbit, the centre of the earth describes the circle dgc round C , to which circle gak is a tangent; and, therefore, when the moon has gone from M a little beyond W , the earth has moved from g to e , and in that time has fallen towards the moon, from the tangent at a to e , and so on round the whole circle.

From the above reasoning it appears, that the parts of the earth directly under the moon, or that have the moon in their zenith, and also those in the nadir, or places diametrically opposite to each other, will have the flood, or high water at the same time.

Moreover, those parts of the earth, where the moon appears in the horizon, or 90° distant from the zenith and nadir, will have the ebbs, or lowest waters.

It is evident that, by the motion of the earth on its axis, the most elevated part of the water is carried beyond the moon in the direction of the rotation. The water continues to rise after it has passed directly under the moon, though the immediate action of the moon there begins to decrease, and comes not to its greatest elevation till it has got half a quadrant farther. It continues also to descend after it has passed at 90° distance from the point below the moon, though the force which the moon adds to its gravity begins to decrease there. For still the action of the moon adds to its gravity, and makes it descend till it has got half a quadrant farther; the greatest elevation, therefore, is not in the points which are in a line with the centres of the earth and moon, but about half a quadrant to the east of these points in the direction of the motion of rotation. Thus in open seas, where the water flows freely, the moon, M , (*fig. 10.*) is generally past the north and south meridian, as at p , when the high water is at Z and at n : the reason of which is plain, because the moon acts with some force after she has past the meridian, and thereby adds to the libratory or waving motion, which the water acquired when she was in the meridian; and, therefore, the time of high water is not precisely at the time of her coming to the meridian, but some time after.

Besides, the tides answer not always to the same distance of the moon from the meridian at the same places; but are variously affected by the action of the sun, which brings them on sooner when the moon is in her first and third quarters, and keeps them back later when she is in her second and fourth; because, in the former case, the tide raised by the sun alone, would be earlier than the tide raised by the moon, and in the latter case later.

For the further illustration of the principle upon which lunar tides depend, we shall suppose, with Dr. Young, that the earth were wholly fluid, and the same part of its surface were always turned towards the moon; in which case, the pole of the spheroid being immediately under the moon, the lunar tide would remain stationary; the greatest elevation being at the points nearest to the moon and farthest from her, and the greatest depression in the circle equally distant from these points; the elevation, however, being twice as great as the depression, on account of the smaller surface to which it is confined. The actual height of this elevation would probably be about 40 inches, and the depression 20, making together a tide of five feet. If also the waters were

capable of assuming instantly such a form as the equilibrium would require, the summit of a spheroid equally elevated would still be directed towards the moon, notwithstanding the earth's rotation. This may be called the primitive tide of the ocean: but on account of the perpetual change of place which is required for the accommodation of the surface to a similar position with respect to the moon, as the earth revolves, the form must be materially different from that of such a spheroid of equilibrium. The force employed in producing this accommodation, may be estimated by considering the actual surface of the sea as that of a wave moving on the spheroid of equilibrium, and producing in the water a sufficient velocity to preserve the actual form. We may deduce, says Dr. Young, from this mode of considering the subject, a theory of the tides which appears to be more simple and satisfactory than any which has yet been published: and by comparing the tides of narrower seas and lakes with the motions of pendulums suspended on vibrating centres, we may extend the theory to all possible cases.

If the centre of a pendulum be made to vibrate, the vibrations of the pendulum itself, when they have arrived at a state of permanence, will be performed in the same time with those of the centre; but the motion of the pendulum will be either in the same direction with that of the centre, or in a contrary direction, accordingly as the time of this forced vibration is longer or shorter than that of the natural vibration of the pendulum; and in the same manner it may be shewn that the tides, either of an open ocean or of a confined lake, may be either direct or inverted with respect to the primitive tide, which would be produced, if the waters always assumed the form of the spheroid of equilibrium, according to the depth of the ocean, and to the breadth as well as the depth of the lake. In the case of a direct tide, the time of the passage of the luminary over the meridian must coincide with that of high water, and in the case of an inverted tide with that of low water.

In order that the lunar tides of an open ocean may be direct, or synchronous, its depth must be greater than 13 miles, and for the solar tides than 14. The less the depth exceeded these limits, the greater the tides would be, and in all cases they would be greater than the primitive tides. But in fact the height of the tides in the open ocean is always far short of that which would be produced in this manner; it is therefore improbable that the tides are ever direct in the open ocean, and that the depth of the sea is so great as 13 miles.

In order that the height of the inverted or remote lunar tides may be five feet, or equal to that of the primitive tides, the depth of the open sea must be $6\frac{1}{2}$ miles; and if the height is only two feet, which is perhaps not far from the truth, the depth must be $3\frac{1}{2}$ miles.

The tides of a lake or narrow sea differ materially from those of the open ocean, since the height of the water scarcely undergoes any variation in the middle of the lake; it must always be high water at the eastern extremity when it is low water at the western: and this must happen at the time when the places of high and low water, with respect to the primitive tides, are equally distant from the middle of the lake.

The tides may be direct in a lake 100 fathoms deep and less than 8° wide; but if it be much wider, they must be inverted. Supposing the depth a mile, they will be direct when the breadth is less than 25° ; but if a sea, like the Atlantic, were 50 or 60 degrees wide, it must be at least four miles deep, in order that the time of high water might coincide with that of the moon's southing.

Hitherto we have considered the motion of the water as
free

TIDES.

free from all resistance ; but where the tides are direct, they must be retarded by the effect of a resistance of any kind ; and where they are inverted, they must be accelerated ; a small resistance producing, in both cases, a considerable difference in the time of high water.

Where a considerable tide is observed in the middle of a limited portion of the sea, it must be derived from the effect of the elevation or depression of the ocean in its neighbourhood ; and such derivative tides are probably combined in almost all cases with the oscillations belonging to each particular branch of the sea.

Lunar tides, the rise and progress of which are scientifically traced by Dr. Young, are subject, independently of the influence of the sun, to a variety of modifications, some of which we shall specify in the sequel of this article.

2. We have hitherto taken notice only of the action of the moon in producing tides ; but it is manifest that, for the same reasons, the inequality of the sun's action on different parts of the earth would produce a like effect, and that this alone would cause a like variation from the exact spherical figure of a fluid earth. So that, in reality, there are two tides every natural day from the action of the sun, as there are in the lunar day from that of the moon, subject to the same laws ; and the lunar tide, as we have observed, is somewhat changed by the action of the sun, and the change varies every day on account of the inequality between the natural and the lunar day. Indeed, the effect of the sun in producing tides, because of his immense distance, must be considerably less than that of the moon, though the gravity toward the sun be much greater, the solar tide being, as Dr. Young states it, only about two-fifths of the lunar. For it is not the action of the sun or that of the moon, but the inequalities in the actions of each, which have any effect. The sun's distance is so great, that the diameter of the earth is as a point compared to it, and the difference between the action of the sun on the nearest, and that on the farthest parts, becomes, on this account, vastly less than it would be if the sun were as near as the moon.

However, the immense bulk of the sun makes the effect still sensible, even at so great a distance ; and, therefore, though the action of the moon has the greatest share in producing the tides, the action of the sun adds sensibly to it when they conspire together, as in the change and full of the moon, when they are nearly in the same line with the centre of the earth, and therefore unite their forces. Thus, in conjunction, or when the sun and moon are on the same side of the earth, they both conspire to raise the water in the zenith, and consequently in the nadir ; and when they are in opposition, that is, when the earth is between them, whilst one makes high water in the zenith and nadir, the other does the same in the nadir and zenith. Consequently, in the syzygies, or at new and full moon, the tides are the greatest, and are what we call the *spring-tides*. Moreover, the action of the sun diminishes the effect of the moon's action in the first and last quarters, because the one raises the water in that case where the other depresses it ; and therefore, in the quadratures the tides are the least, and are called *neap-tides*.

As the lunar tide is much larger than the solar tide, the former must always determine the time of high and low water, which, in the spring and neap-tides, remains unaltered by the effect of the sun ; so that in the neap-tides the actual time of low water is that of the solar high water ; but at the intermediate times, the lunar high water is more or less accelerated or retarded. The progress of this alteration may easily be traced by means of a simple construction. If we make a

triangle, of which two of the sides are two feet and five feet in length, the external angle which they form being equal to twice the distance of the luminaries, the third side will shew precisely the magnitude of the compound tide, and the halves of the two angles opposite to the first two sides the acceleration, or retardation, of the times of high water belonging to the separate tides respectively. Hence it appears that the greatest deviation of the joint tide from the lunar tide amounts to $11^{\circ} 48'$ in longitude, and the time corresponding to 47 minutes, supposing the proportion of the forces to remain always the same ; but in fact the forces increase in proportion as the cubes of the distances of their respective luminaries diminish, as well as from other causes ; and in order to determine their joint effects, the lengths of the sides of the triangle must be varied accordingly. In some ports, from a combination of circumstances in the channel, by which the tides reach them, or in the seas, in which they originate, the influence of the sun and moon may acquire a proportion somewhat different from that which naturally belongs to them : thus at Brest, the influence of the moon appears to be three times as great as that of the sun ; when it is usually only twice and a half as great.

Sir Isaac Newton has calculated the effects of the sun and moon respectively upon the tides from their attractive powers. The augmentation of the gravity of the lateral parts of the earth, produced by the action of the sun, is a similar effect to an augmentation, estimated by him on another occasion, that is made to the gravity of the moon toward the earth by the same action, when the moon is in the quarters ; only the addition made to the gravity of the lateral parts is about $60\frac{1}{2}$ times less, because their distance from the earth's centre is so many times less than the distance of the moon from it. The gravity of those parts of the earth that are directly beneath the sun, and of those opposite to it, is diminished by a double quantity of what is added to the lateral parts ; and as the diminution of gravity of the one, and augmentation of gravity of the other, conspire together in raising the water under the sun, and the parts opposite to it, above its height in the lateral parts ; the whole force that produces this effect is to be considered as triple of what is added to the gravity of the lateral parts ; and is thence found to be to the gravity of the particles as 1 to 12868200, and to the centrifugal force at the equator as 1 to 44527. The elevation of the waters by this force is considered by Newton as an effect similar to the elevation of the equatorial parts above the polar parts of the earth, arising from the centrifugal force at the equator ; and, being 44527 times less, is found to be 1 foot and $11\frac{1}{5}$ inches, Paris measure. This is the elevation arising from the action of the sun upon the water.

Mr. Maclaurin makes this elevation to be 1 foot $10\frac{8}{10000}$ inches, of the same measure, which differs from the above estimate by the $\frac{1}{100}$ th part of an inch ; and the greatest elevation, when the sun is in the equinoctial, 1 foot $11\frac{1}{5}$ inches.

In order to find the force of the moon upon the water, Newton compares the spring-tides, at the mouth of the river Avon, below Bristol, with the neap-tides there, and finds their proportion to be that of 9 to 5 ; whence, after several necessary corrections, he concludes, that the force of the moon is to that of the sun, in raising the waters of the ocean, as 4.4815 to 1 ; so that the force of the moon is able, of itself, to produce an elevation of 8 feet and $7\frac{2}{3}$ inches, and the sun and moon together may produce an elevation of about 10 $\frac{1}{2}$ feet, in their mean distances from the earth, and an elevation of about 12 feet, when the

moon is nearest the earth. The height to which the water is found to rise, upon coasts of the open and deep ocean, is agreeable enough to this computation.

Dr. Horsley estimates the force of the moon to that of the sun as 5.0469 to 1. Newton Princip. lib. iii. sect. iii. prop. 36, 37, apud Newt. Op. Ed. Horsley, vol. iii. p. 104. &c. and Maclaurin's Diff. de Causa Physica Fluxus & Refluxus Maris, apud Phil. Nat. Princ. Math. Comment. le Seur & Jacquier, tom. iii. p. 272.

3. It must be observed that the spring-tides do not happen precisely at new and full moon, nor the neap-tides at the quarters, but a day or two after, (at least two, and commonly three tides after,) because, as in other cases, so in this, the effect is not greatest or least when the immediate influence of the cause is greatest or least. As, *e. g.* the greatest heat is not on the solstitial day, when the immediate action of the sun is greatest, but some time after.

That this may be more clearly understood, let it be considered, that though the actions of the sun and moon were to cease this moment, yet the tides would continue to have their course for some time; for the water, where it is now highest, would subside, and flow down on the parts that are lower, till, by the motion of descent, being there accumulated to too great a height, it would necessarily return again to its first place, though in a less measure, being retarded by the resistance arising from the attraction of its parts. Thus it would for some time continue in an agitation like to that in which it is at present. The waves of the sea, that continue after a storm ceases, and every motion almost of a fluid, may illustrate this.

The resistance of fluids, in general, says Dr. Young, is as the square of the velocity, consequently it must be much greater for the lunar than for the solar tide, in proportion to the magnitude of the force; and the acceleration of the lunar tide produced by this cause must be greater than that of the solar: hence it may happen, that when the lunar tide occurs two or three hours after the transit of the moon, the solar tide may be three or four hours after that of the sun, so as to be about an hour later, at the times of conjunction and opposition, and the tides will be highest when the moon passes the meridian about an hour after the sun; while at the precise time of the new and full moon, the lunar tide will be retarded about a quarter of an hour by the effect of the solar tide.

4. The different distances of the moon from the earth produce a sensible variation in the tides. When the moon approaches the earth, her action on every part increases, and the differences of that action on which the tides depend, increase. For her action increases as the squares of the distances decrease; and though the differences of the distances themselves be equal, yet there is a greater disproportion betwixt the squares of less, than the squares of greater quantities; *e. g.* 3 exceeds 2, as much as 2 exceeds 1; but the square of 2 is quadruple of the square of 1, whilst the square of 3 (*viz.* 9) is little more than double the square of 2 (*viz.* 4).

Thus it appears, that by the moon's approach, her action on the nearest parts increases more quickly than her action on the remote parts; and the tides, therefore, increase in a higher proportion as the distances of the moon decrease. Sir Isaac Newton shews, that the tides increase in proportion as the cubes of the distances decrease, so that the moon, at half her present distance, would produce a tide eight times greater.

The moon describes an ellipse about the earth, and in her nearest distance produces a tide sensibly greater than at her

greatest distance from the earth: and hence it is, that two great spring-tides never succeed each other immediately; for if the moon be at her nearest distance from the earth at the change, she must be at her greatest distance at the full, having, in the intervening time, finished half a revolution; and, therefore, the spring-tide then will be much less than the tide at the change was: and for the same reason, if a great spring-tide happens at the time of full moon, the tide at the ensuing change will be less.

5. The spring-tides are greatest about the time of the equinoxes, *i. e.* about the latter end of March and September, and least about the time of the solstices, *i. e.* toward the end of June and December; and the neap-tides are least at the equinoxes and greatest at the solstices; so that the difference betwixt the spring and the neap-tides is much less considerable at the solstitial than at the equinoctial seasons. In order to illustrate and evince the truth of this observation, it is manifest, that if either the sun or moon were in the pole, they could have no effect on the tides, for their action would raise all the water at the equator to the same height, and any place of the earth, in describing its parallel to the equator, would not meet, in its course, with any part of the water more elevated than another, so that there could be no tide in any place.

The effect of the sun or moon is greatest when in the equinoctial; for then the axis of the spheroidal figure, arising from their action, moves in the greatest circle, and the water is put into the greatest agitation; and hence it is that the spring-tides produced, when the sun and moon are both in the equinoctial, are the greatest of any, and the neap-tides are the least of any, about that time.

But the tides produced when the sun is in either of the tropics, and the moon in either of her quarters, are greater than those produced when the sun is in the equinoctial, and the moon in her quarters, because, in the first case, the moon is in the equinoctial, and in the latter case, the moon is in one of the tropics; and the tide depends more on the action of the moon than that of the sun, and is, therefore, greatest when the moon's action is greatest.

However, it is necessary to observe, 6. That, because the sun is nearer the earth in winter than in summer, *i. e.* in February and October than in March and September, the greatest spring-tides are after the autumnal, and before the vernal equinox.

7. Since the greatest of the two tides happening in every diurnal revolution of the moon, or lunar day, *i. e.* about 24^h 50^m, is that in which the moon is nearest the zenith, or nadir; for this reason, while the sun is in the northern signs, the greater of the two diurnal tides in our climates, is that arising from the moon above the horizon: when the sun is in the southern signs, the greatest is that arising from the moon below the horizon.

In proof of this observation, let it be considered, that when the moon declines from the equator toward either pole, one of the greatest elevations of the water follows the moon, and describes nearly the parallel on the earth's surface which is under that which the moon, on account of the diurnal motion, seems to describe; and the opposite greatest elevation, being antipodal to that, must describe a parallel as far on the other side of the equator; so that while the one moves on the north side of the equator, the other moves on the south side of it, at the same distance. Now the greatest elevation which moves on the same side of the equator, with any place, will come nearer to it than the opposite elevation, which moves in a parallel on the other side of the equator; and, therefore, if a place is on the same

TIDES.

side of the equator with the moon, the day-tide, or that which is produced while the moon is above the horizon of the place, will exceed the night-tide, or that which is produced while the moon is under the horizon of the place. It is the contrary if the moon is on one side, and the place on the other side of the equator; for then the elevation which is opposite to the moon, moves on the same side of the equator with the place, and, therefore, will come nearer to it than the other elevation. The difference will be greatest when the sun and moon both describe the tropics; because the two elevations in that case describe the opposite tropics, which are the farthest from each other of any two parallel circles they can describe. Thus it is found, by observation, that the evening tides in the summer exceed the morning tides, and the morning tides in winter exceed the evening tides. The difference is found at Bristol to amount to fifteen inches, and at Plymouth to one foot. It would be still greater, but that a fluid always retains an impressed motion for some time; so that the preceding tides affect always those that follow them. Upon the whole, while the moon has north declination, the greatest tides in the northern hemisphere are when she is above the horizon, and the reverse while her declination is south.

To illustrate this matter by figures; let $NE SQ$ (*fig. 12*, *13*, *14*.) be the earth, NCS its axis, EQ the equator, $T \infty$ the tropic of Cancer, $t \wp$ the tropic of Capricorn, ab the arctic circle, cd the antarctic, N the north pole, S the south pole, M the moon, F and G the two eminences of water, whose lowest parts are at a and d (*fig. 12*.), at N and S (*fig. 13*.), and at b and c (*fig. 14*.), always 90° from the highest.

Now, when the moon is in her greatest north declination at M (*fig. 12*.), the highest elevation, G , under her is on the tropic of Cancer, $T \infty$, and the opposite elevation, F , on the tropic of Capricorn, $t \wp$; and these two elevations describe the tropics by the earth's diurnal rotation. All places in the northern hemisphere, ENQ , have the highest tides when they come into the position $b \infty Q$, under the moon; and the lowest tides when the earth's diurnal rotation carries them into the position $a TE$, on the side opposite to the moon: the reverse happens at the same time in the southern hemisphere ESQ , as is evident to sight. The axis of the tides aCd has now its poles a and d (being always 90° from the highest elevations) in the arctic and antarctic circles; and, therefore, it is plain, that at these circles there is but one tide of flood, and one of ebb, in the lunar day. For when the point a revolves half round to b in twelve lunar hours, it has a tide of flood; but when it comes to the same point a again in twelve hours more, it has the lowest ebb. In seven days afterward, the moon M (*fig. 13*.) comes to the equinoctial circle, and is over the equator EQ , when both elevations describe the equator; and in both hemispheres, at equal distances from the equator, the tides are equally high in both parts of the lunar day. All the phenomena being reversed, when the moon has south declination, to what they were when her declination was north, require no farther description, *fig. 14*.

From what has been said it appears, that as the tides are governed by the moon, they must turn on the axis of the moon's orbit, which is inclined $23\frac{1}{2}$ degrees to the earth's axis at a mean state; and, therefore, the poles of the tides must be so many degrees from the poles of the earth, or in opposite points of the polar circles, going round these circles in every lunar day. It is true that, according to *fig. 14*, when the moon is vertical to the equator ECQ , the poles of the tides seem to fall in with the poles of the

world N and S ; but when we consider that FGH is under the moon's orbit, it will appear that when the moon is over H , in the tropic of Capricorn, the north pole of the tides (which can be no more than 90° from under the moon) must be at C in the arctic circle, not at P , the north pole of the earth; and as the moon ascends from H to G in her orbit, the north pole of the tides must shift from c to a in the arctic circle, and the south pole as much in the antarctic.

It is not to be doubted, but that the earth's quick rotation brings the poles of the tides nearer to the poles of the world than they would be if the earth were at rest, and the moon revolved about it only once a month; for, otherwise, the tides would be more unequal in their heights, and times of their returns, than we find they are. But how near the earth's rotation may bring the poles of its axis and those of the tides together, or how far the preceding tides may affect those which follow, so as to make them keep up nearly to the same heights, and times of ebbing and flowing, is a problem more fit to be solved by observation than by theory.

Those who have opportunity to make observations, and choose to satisfy themselves whether the tides are really affected in the above manner by the different positions of the moon, especially as to the unequal times of their returns, may take this general rule for knowing when they ought to be so affected. When the earth's axis inclines to the moon, the northern tides, if not retarded in their passage through shoals and channels, nor affected by the winds, ought to be greatest when the moon is above the horizon, least when she is below it; and quite the reverse when the earth's axis declines from her; but in both cases at equal intervals of time. When the earth's axis inclines sideways to the moon, both tides are equally high, but they happen at unequal intervals of time. In every lunation the earth's axis inclines once to the moon, once from her, and twice sideways to her, as it does to the sun every year; because the moon goes round the ecliptic every month, and the sun but once in a year. In summer, the earth's axis inclines towards the moon when new; and, therefore, the day-tides in the north ought to be highest, and night-tides lowest about the change: at the full the reverse. At the quarters they ought to be equally high, but unequal in their returns; because the earth's axis then inclines sideways to the moon. In winter the phenomena are the same at full moon as in summer at new. In autumn the earth's axis inclines sideways to the moon when new and full; therefore the tides ought to be equally high and unequal in their returns at these times. At the first quarter the tides of flood should be least when the moon is above the horizon, greatest when she is below it, and the reverse at her third quarter. In spring, the phenomena of the first quarter answer to those of the third quarter in autumn, and *vice versa*. The nearer any time is to either of these seasons, the more the tides partake of the phenomena of these seasons; and in the middle between any two of them, the tides are at a mean state between those of both.

8. Such would the tides regularly be, if the earth were all over covered with sea very deep, so that the water might follow the influence of the sun and moon; but, by reason of the shoalness of some places, and the narrowness of the straits in others, by which the tides are propagated, there arises a great diversity in the effect, not to be accounted for, without an exact knowledge of all the circumstances of the places; such as the position of the land, and the breadth and depth of the channels, direction of the winds, &c. For a very slow and imperceptible motion of the whole body of water,

TIDES.

water, where it is (for example) two miles deep, will suffice to raise its surface ten or twelve feet in a tide's time; whereas, if the same quantity of water were to be conveyed through a channel forty fathoms deep, it would require a very great stream to effect it in so large inlets as are the channel of England and the German ocean; whence the tide is found to set strongest in those places where the sea grows narrowest, the same quantity of water being, in that case, to pass through a smaller passage.

This is most evident in the straits between Portland and Cape la Hogue in Normandy, where the tide runs like a sluice; and would be yet more between Dover and Calais, if the tide, coming round the island, did not check it.

This force, being once impressed upon the water, continues to carry it above the level of the ordinary height of the ocean, particularly where the water meets a direct obstacle, as it does in St. Maloes; and where it enters into a long channel, which running far into the land, grows very straight at its extremity, as it does into the Severn sea at Chepstow, where the tide rises to 40 feet, and Bristol, where its height is 30 feet. At Brest, the height of the tides is about 20 feet; at St. Maloes, 50; at Annapolis, in the bay of Fundy, as much sometimes as 100 feet. In the Mediterranean, the tides are generally inconsiderable; nevertheless they are perceptible: at Naples, they sometimes rise to a foot; at Venice, to more than two feet; and in the Euripus, for a certain number of days in each lunation, they are very distinctly observable from the currents which they occasion. In the West Indies, and also in the gulf of Mexico, the tides are less observable than in the neighbouring seas, perhaps on account of some combinations derived from the variations of the depth of the rivers, and from the different channels by which they are propagated.

The shoalness of the sea, and the intercurrent continents, are the reasons that in the open ocean the tides rise but to very small heights in proportion to what they do in wide-mouthed rivers, opening in the direction of the stream of the tide; and that high-water is not at the time of the moon's appulse to the meridian, but always some hours after it, as it is observed upon all the western coasts of Europe and Africa, from Ireland to the Cape of Good Hope; in all which a south-west moon makes high water; and the same is reported to hold in the west of America.

So that tides happen to different places at all distances of the moon from the meridian, and consequently at all hours of the lunar day.

It is to be considered that, in order to allow the tides their full motion, the ocean, in which they are produced, ought to be extended from east to west 90° at least. Because the places, where the moon rises most, and most depresses the water, are at that distance from each other. Hence it appears, that it is only in the great oceans that such tides can be produced, and why in the larger Pacific ocean they exceed those in the Atlantic ocean. Hence also it is obvious, why the tides are not so great in the torrid zone, between Africa and America, where the ocean is narrower, as in the temperate zones on either side; and we may hence also understand, why the tides are so small in islands that are very far distant from the shores. It is manifest, that, in the Atlantic ocean, the water cannot rise on one shore but by descending on the other; so that, at the intermediate distant islands, it must continue at a mean height betwixt its elevation on one and on the other shore. But when tides pass over shoals, and through straits into bays of the sea, their motion becomes more various, and their height depends on many circumstances.

The tide entering the Atlantic appears, says Dr. Young, to advance northwards at the rate of about 500 miles an hour, corresponding to a depth of about three miles, so as to reach Sierra Leone at the eighth hour after the moon's southing; this part of Africa being not very remote from the meridian of the middle of the South Atlantic ocean, and having little share in the primitive tides of that ocean. The southern tide seems then to pass by Cape Blanco and Cape Bojador, to arrive at Gibraltar at the thirteenth hour, and to unite its effects with those of other tides at various parts of the coasts of Europe.

We may therefore consider the Atlantic as a detached sea, about 3500 miles broad, and three miles deep; and a sea of these dimensions is susceptible of tides considerably larger than those of the ocean, but how much larger we cannot determine without more accurate measures. These tides would happen on the European coasts, if there were no resistance, a little less than five hours after the moon's southing, and on the coast of America, a little more than seven hours after; but the resistance opposed to the motion of the sea may easily accelerate the time of high-water in both cases about two hours, so that it may be a little before the third hour on the western coasts of Europe and of Africa, and before the fifth on the most exposed parts of the eastern coast of America; and in the whole of the Atlantic, this tide may be combined more or less both with the general southern tide, and with the partial effects of local elevations or depressions of the bottom of the sea, which may cause irregularities of various kinds. The southern tide is, however, probably less considerable than has sometimes been supposed, for, in the latitudes in which it must originate, the extent of the elevation can only be half as great as at the equator; and the islands of Kerguelen's land and South Georgia, in the latitudes of about 50° and 55°, have their tides delayed till the tenth and eleventh hours, apparently because they received them principally from distant parts of the ocean, which are nearer to the equator.

On the western coasts of Europe, from Ireland to Cadiz; on those of Africa, from Cape Coast to the Cape of Good Hope; and on the coast of America, from California to the straits of Magellan, as well as in the neighbouring islands; it is usually high-water at some time between two and four hours after the moon's southing; on the eastern coast of South America, between four and six; on that of North America, between seven and eleven; and on the eastern coasts of Asia and New Holland, between four and eight. The Society Islands are perhaps too near the middle of the Pacific ocean to partake of the effects of its primitive tide, and their tide, being secondary, is probably for this reason a few hours later. At the Almirantes, near the eastern coast of Africa, the tide is at the sixth hour; but there seem to be some irregularities in the tides of the neighbouring islands.

The progress of a tide may be very distinctly traced from its source in the ocean into the narrow and shallow branches of the sea which constitute our channels. Thus the tide is an hour or two later at the Scilly Islands than in the Atlantic, at Plymouth three, at Cork, Bristol, and Weymouth four, at Caen and Havre six, at Dublin and Brighthelmston seven, at Boulogne and Liverpool eight, at Dover near nine, at the Nore eleven, and at London-bridge twelve and a half. Another portion appears to proceed round Ireland and Scotland into the North sea; it arrives from the Atlantic at Londonderry in about three hours, at the Orkneys in six, at Aberdeen in eleven, at Leith in fourteen, at Loestoffe in twenty, and at the Nore in about twenty-four, so as to meet there the subsequent tide coming from the south. From the time occupied by the tide in travelling from the mouth of the English Channel

TIDES.

Channel to Boulogne, at the rate of about fifty miles an hour, we may calculate that the mean depth of the channel is about twenty-eight fathoms, independently of the magnitude of the resistances of various kinds to be overcome, which require us to suppose the depth from thirty to forty fathoms. In the great river of Amazons, the effects of the tides are still sensible at the streights of Pauxis, 500 miles from the sea, after an interval of several days spent in their passage up: for the slower progressive motion of the water no more impedes the progress of a wave against the stream, than the velocity of the wind prevents the transmission of sound in a contrary direction.

Dr. Young observes, that scarcely a single instance occurs that favours the supposition of high water in the open sea being within an hour of the moon's southing, as it must be if the depth were very great; so that neither the height of the tide, nor the time of high-water, will allow us to suppose the sea any where quite so deep as four miles.

The tide that is produced on the western coasts of Europe, in the Atlantic, corresponds to the situation of the moon already described. Thus it is high-water on the coasts of Spain, Portugal, and the west of Ireland, about the third hour after the moon has passed the meridian; from thence it flows into the adjacent channels, as it finds the easiest passage. One current from it, *e. g.* runs up by the south of England, another comes in by the north of Scotland; they take a considerable time to move all this way, and it is high-water sooner in the places to which they first come, and it begins to fall at those places, while they are still going on to others that are farther in their course. As they return, they are not able to raise the tide, because the water runs faster off than it returns, till, by a new tide propagated from the open ocean, the return of the current is stopped, and the water begins to rise again. The tide, propagated by the moon in the German ocean, when she is three hours past the meridian, takes about twelve hours to come from thence to London-bridge; so that when it is high-water there, a new tide is already come to its height in the ocean; and, in some intermediate place, it must be low water at the same time.

Consequently, when the moon has north declination, and we should expect the tide at London to be the greatest when the moon is above the horizon, we find it is least; and the contrary when she has south declination.

At several places it is high-water three hours before the moon comes to the meridian; but that tide which the moon pushes, as it were, before her, is only the tide opposite to that which was raised by her when she was nine hours past the opposite meridian.

It would be endless to recount all the particular solutions which are easy corollaries from this doctrine: as why the lakes and seas, such as the Caspian sea and the Mediterranean sea, the Black sea and Baltic, have either small or no very sensible tides: for lakes are generally so small, that when the moon is vertical she attracts every part of them alike, and therefore no part of the water can be raised higher than another: and having no communication with the ocean, it can neither increase nor diminish their water, in order to rise and fall; and seas that communicate by such narrow inlets, and are of so immense an extent, cannot, in a few hours time, receive and empty water enough to raise or sink their surface any thing sensibly.

To demonstrate the excellency of this doctrine, the example of the tides in the port of Batsha, in the kingdom of Tonquin, in the East Indies, $20^{\circ} 50' N.$ lat. which are so extraordinary and different from all others we have yet heard of, may suffice.

The day in which the moon passes the equinoctial, the

water stagnates there without any motion; as the moon moves from the equinoctial, the water begins to rise and fall once a day; and it is high-water at the setting of the moon, and low-water at her rising. This daily tide increases for about seven or eight days, and then decreases for as many days by the same degrees, till this motion ceases, when the moon has returned to the equinoctial. When she has passed the equinoctial, and declines toward the south pole, the water rises and falls again as before; but it is high-water now at the rising, and low-water at the setting of the moon.

Sir Isaac Newton, in order to account for this extraordinary tide, considers that there are two inlets to this port of Batsha, one from the Chinese ocean, betwixt the continent and the Manillas, the other from the Indian ocean, betwixt the continent and Borneo. This leads him to propose, as a solution of this phenomenon, that a tide may arrive at Batsha, through one of these inlets, at the third hour of the moon, and another through the other inlet six hours after, at the ninth hour of the moon. For, while these tides are equal, the one flowing in as the other ebbs out, the water must stagnate; now they are equal when the moon is in the equinoctial; but as soon as the moon begins to decline on the same side of the equator with Batsha, it has been shewn that the diurnal tide must exceed the nocturnal, so that two greater and two lesser tides must arrive at Batsha by turns. The difference of these will produce an agitation of the water, which will rise to its greatest height at the mean time betwixt the two greatest tides, and fall lowest at a mean time betwixt the two least tides; so that it will be high-water about the sixth hour at the setting of the moon, and low-water at her rising. When the moon has got to the other side of the equinoctial, the nocturnal tide will exceed the diurnal; and, therefore, the high-water will be at the rising, and low-water at the setting of the moon.

The same principles will serve to account for other extraordinary tides, which, we are told, are observed in places whose situation exposes them to such irregularities: and, as some think, for particular currents and winds. See CURRENT and WINDS.

When the time of high-water at any place is, in general, mentioned, it is to be understood on the days of the syzygies, or days of new and full moon; when the sun and moon pass the meridian of the place at the same time. Among pilots, it is customary to reckon the time of flood, or high-water, by the point of the compass the moon bears on, allowing three quarters of an hour for each point, at that time; thus, on the full and change days, in places where it is flood at noon, the tide is said to flow N. and S., or at 12 o'clock; in other places, on the same days, where the moon bears 1, 2, 3, 4, or more points to the E. or W. of the meridian, when it is high-water, the tide is said to flow on such point; thus, if the moon bears S.E. at flood, it is said to flow S.E. and N.W. or three hours before the meridian, that is, at 9 o'clock; if it bears S.W. it flows S.W. and N.E. or at three hours after the meridian; and in like manner for other points of the moon's bearing.

The times of high-water in any place fall about the same hours after a period of about fifteen days, or between one spring-tide and another; but during that period, the times of high-water fall each day later by about forty-eight minutes.

From the observations of many persons there have been collected the times when it is high-water on the days of the new and full moon, on most of the sea-coasts of Europe, and many other places; which are usually put in a table against the names of the places; a specimen of which is subjoined.

TIDES.

A TABLE of the Times of High-Water on the Days of the New and Full Moon, on most of the Sea-Coasts of Europe.

The following times serve for coasts of considerable extent, and nearly for the places on those coasts; *viz.* Finmark, or N.N.W. coast of Lapland, 1^h 30^m; Jutland isles, 0^h 0^m; Friesland coast, 7^h 30^m; Zealand coast, 1^h 30^m; Flanders coast, 0^h 0^m; Picardy and Normandy coasts, 10^h 30^m; Biscay, Gallician, and Portugal coasts, 3^h 0^m; Irish west coast, 3^h 0^m; Irish south coast, 5^h 15^m; Africa west coast, 3^h 0^m; America west coast, 3^h 0^m; America east coast, 4^h 30^m.

The use of the preceding table is to find the time of high-water at any of the places contained in it: for this purpose, find the time of the moon's southing on a given day (see MOON); and then add the time which the moon has passed the meridian on the full and change days, to make high-water at that place; and the sum shews the time of high-water on the given day.

See on the subject of this article, Newton Princ. Math. lib. iii. prop. 24. and De System. Mundi, sect. 38-54. Apud Opera Ed. Horsley, tom. iii. p. 25, &c. p. 203, &c. Maclaurin's Account of Sir I. Newton's Discoveries, book iv. ch. 7. Ferguson's Astron. ch. xvii. Robertson's Navig. book vi. sect. vii. viii. ix. Young's Lectures.

TIDE-Dial, the name of an instrument contrived by Mr. Ferguson, for exhibiting and determining the state of the tides. It is represented in *Plate IV. Dialling, fig. 36.* and the external parts of it consist of 1. An eight-sided box, on the top of which, at the corners, are shewn the phases of the moon at the octants, quarters, and full. Within these is a circle of 29½ equal parts, which are the days of the moon's age reckoned from the sun at new moon, round to the sun again. Within this circle is one of twenty-four hours, divided into their halves and quarters. 2. A moving elliptical plate, painted blue, to shew the rising of the tides under and opposite to the moon, with the words *high-water, tide-falling, low-water, tide-rising*, marked upon it. To one end of this plate is fixed the moon M by the wire W, which goes along with it. 3. Above this elliptical plate is a round one, with the points of the compass upon it, and also the names of above two hundred

places in the large machine (but only thirty-two in the figure, to avoid confusion) set over those points on which the moon bears when she raises the tides to the greatest heights at these places, twice in every lunar day; and to the north and south points of this plate are fixed two indices I and K, which shew the times of high-water, in the hour-circle, at all these places. 4. Below the elliptical plate are four small plates, two of which project out from below its ends at new and full moon; and so, by lengthening the ellipse, shew the spring-tides: the other two of these small plates appear at low-water when the moon is in her quadratures, or at the sides of the elliptic plate, to shew the neap-tides. When any two of these small plates appear, the other two are hid; and when the moon is in her octants, they all disappear. Within the box are a few wheels for performing these motions by the handle H. Turn the handle till the moon, M, comes to any given day of her age in the circle of 29½ equal parts, and the moon's wire W will intersect the time of her coming to the meridian on that day, in the hour-circle: the XII under the sun being mid-day, and the opposite XII mid-night: then looking for the name of any given place on the round plate (which makes 29½ rotations, whilst the moon M makes only one revolution from the sun to the sun again) turn the handle till that place comes to the word *high-water* under the moon, and the index which falls among the forenoon hours will shew the time of high-water at that place in the forenoon of the given day: then turn the plate half round, till the same place comes to the opposite high-water mark, and the index will shew the time of high-water in the afternoon at that place. And thus, as all the different places come successively under and opposite to the moon, the indices shew the times of high-water at them in both parts of the day; and when the same places come to the low-water marks, the indices shew the times of low-water. For about three days before and after the times of new and full moon, the two small plates come out a little way from below the high-water marks on the elliptical plate, to shew that the tides rise still higher about these times: about the quarters, the other two plates come out a little from under the low-

water marks toward the sun, and on the opposite side, shewing that the tides of flood rise not then so high, nor do the tides of ebb fall so low, as at other times. For the description of the inside work of this machine, and the method of constructing it, see FERGUSON'S *Astron.* p. 297.

TIDE-Gage. See **GAGE.**

TIDE-Gates are the lower gates of a lock open to a tide-way: these are also placed at the mouths of drains.

TIDE-Mill, in *Rural Economy and Agriculture*, an useful sort of mill, the moving power of which is formed by running a dam across an inlet where tide-water comes in, so as to leave a narrow passage open for placing it in on one side. It also signifies a mill for raising and clearing lands from tide-water in fen situations, and where injury is done by the overflowing of the tides. See **WATERING of Land.**

Tide-mills may mostly be formed without producing any obstruction or hindrance to agriculture.

TIDE-Waiters, or *Tide-Men*, certain officers belonging to the custom-house, appointed to watch or attend on ships coming from abroad, to see that nothing be landed till the customs be paid.

They are thus called, because they go aboard the ships at their arrival in the mouth of the Thames, and come up with the tide.

TIDENS DORF, in *Geography*, a town of Prussia, in the province of Ermeland; 4 miles S. of Frauenburg.

TIDER, or **NER**, a small island in the Atlantic, near the coast of Africa. N. lat. $19^{\circ} 30'$.

TIDESWELL, a small market-town in the hundred of High Peak, and county of Derby, England; is situated in a valley among bleak hills, 32 miles N.N.W. from the county-town, and 160 miles N.W. by N. from London. The town is reported to have received its name from an ebbing and flowing well, now hardly remembered, as it has long ceased to flow. The church, which was erected in the fourteenth century, is a handsome edifice of the conventual form, with a neat tower at the west end, terminated by eight pinnacles; those at the angles rising from octagonal bases, and being much higher than the intermediate ones. In the chancel is a small stone commemorative of John Foljambe, who died in 1358, and is said to have contributed much towards the building of the church. A raised tomb perpetuates the name of Sampson Meurill, who died in 1462, and who, in the course of two years, was engaged in eleven battles in France. Among other monuments of ancient date, is one to the memory of a native of this town, Robert Purflove, prior of Gisburn priory, who obtained a pension from Henry VIII. for his obsequious compliance with that monarch's wishes, in not only surrendering his own house, but also acting as a commissioner to procure the surrender of others. In queen Mary's reign he was appointed archdeacon of Nottingham, and suffragan bishop of Hull; but on the accession of Elizabeth, he was deprived of all his spiritualities, and retired to Tideswell, where, having founded a grammar-school, and an hospital for twelve poor people, he died in 1579. By the population return of the year 1811, the inhabitants of this parish are stated to be 1219, who are chiefly supported by the mining business; the number of houses, which are mostly scattered on the opposite banks of a rivulet, was estimated at 283. A weekly market is held on Wednesdays; and here are three annual fairs.

In the vicinity of Tideswell is the sequestered retreat of Monsal-Dale, peculiarly eminent for picturesque beauty. Near the head of the Dale, the rocks jut out on the south

side, like the immense towers of a strong fortress. Lower down, the crags soften into verdure, the dale expands, and the eye dwells enraptured on the rich prospect that presents itself. The back-ground is formed by a steep precipice, variegated by short herbage and brushwood, with occasionally a starting rock breaking its continuity of surface. On the summit of an eminence called the Great Finn, was a large barrow, about 160 feet in circumference, chiefly composed of broken masses of limestone, to obtain which the barrow was destroyed about the year 1795. Within this tumulus various skeletons were discovered, two of them of gigantic size, with several urns, and other ancient memorials; among which were two arrow-heads of flint, whence the barrow is supposed to have been of very remote antiquity; for, as the learned author of "*Nenia Britannica*" observes, "flint arrow-heads are evidences of a people not in the use of malleable metal; and it therefore implies, wherever these arms are found in barrows, they are incontrovertibly the relics of a primitive barbarous people, and preceding the era of those barrows in which brass or iron arms are found." It is worthy of note, that, excepting on the side next the precipice, the summit of the Great Finn is surrounded by a double ditch, with a vallum to each - the distance between the banks is 160 yards.

Near the hamlet of Wormhill, in this parish, is a romantic and deep glen or dale, where the river Wye flows beneath a stupendous mass of rock, called *Chee-Tor*. This mass of freestone rises about 300 feet above the level of the river, and constitutes a most imposing and singular feature. At a small hamlet called Tunited, in the liberty of Wormhill, was born James Brindley, justly famed for his successful efforts in planning and executing canals. See **BRINDLEY**.—*Beauties of England and Wales*, vol. iii. Derbyshire; by J. Britton and E. W. Brayley. *Davies's Historical and Descriptive Account of Derbyshire*, 8vo. 1811.

TIDEWA, a town of Sweden, in West Gothland; 62 miles N.E. of Uddevalla.

TIDLÄ, a river of Sweden, which runs into the Wenner lake, near Mariestad, in the province of West Gothland.

TIDON, a town on the east coast of the island of Celebes, in the bay of Gunong Tellu. N. lat. $0^{\circ} 3'$. E. long. $120^{\circ} 38'$.

TIDOR, or **TIDORE**, an island in the East Indian sea, and one of those called Moluccas, situated near the west coast of the island of Gilolo, between Ternate and Timor; about ten leagues in circumference, and so called from its capital, though named Tadura, or Daco, by the natives. It abounds in spices, especially cloves. The Dutch have several forts, but the island is governed by a king, who possesses likewise some territory on the island of Gilolo; 15 miles S.E. of Ternate. N. lat. $0^{\circ} 42'$. E. long. $127^{\circ} 19'$.

TIDSI, a river of Morocco, which discharges itself into the ocean a few miles S. of the Tegrewelt, or Cape Oflam.

TIEBAS, a town of Spain, in the province of Navarre; 5 miles S.E. of Pamplona.

TIEDEMAN, **DIETERICH**, in *Biography*, a philosophical writer, was born April 1748, at Bremervorde, in the duchy of Bremen, and educated in the school of his native place in the Greek and Latin languages, in which he made very considerable proficiency. Devoting himself to the church, he removed to the school of Verden, and from thence to the Athenæum at Bremen, where he formed an intimate friendship with Meiners, afterwards professor at Göttingen.

Gottingen. In 1767 he settled at Gottingen, and here he renounced the study of theology, because he disapproved the system there taught, and applied to mathematics, classical literature, and philosophy. In the winter of 1769 he fixed his residence in Livonia, as tutor to a nobleman of that country; and whilst he was there, he published at Riga, in 1772, his "Essay on the Origin of Language." After visiting his native place in the following year, he went to Gottingen, and formed an acquaintance with the celebrated Heyne, who wrote a preface to his "System of the Stoic Philosophy," and persuaded him to publish it. By the recommendation of this learned friend, he was appointed professor of ancient literature in the Caroline college at Cassel, of which office he took possession in 1766. His intervals of leisure were employed in the study of philosophy and its history; and also in preparing for the press his "Investigation of Man," "The First Philosophers of Greece, &c." and his "Spirit of Speculative Philosophy." Upon the dissolution of the Caroline college in 1786, he occupied the chair of philosophy at Marburg, and his lectures were very popular. He was an opposer of Kant's philosophy: and he indulged himself in ridiculing the extravagant pretensions or pious arrogance of the founders of sects. Although his constitution was robust, he was carried off by a fever and inflammation of the lungs, in May 1803, at the age of 55. As a literary character, he was intimately conversant with the literature of Greece and Rome, and with all the systems of ancient and modern philosophy, as well as the manners and customs of ancient and modern times. His extensive erudition appears in his "Argumenta Platonis," annexed to the edition of Plato, printed at Deux-Ponts; in his prize essay, entitled "Disputatio de Quæstione quæ fuerit magicarum artium origo," and in various other dissertations. In philosophy he was in early life a dogmatist, and in the latter period of his life inclined to scepticism. His works, which, besides those already mentioned, were numerous, and relate chiefly to the history of philosophy, and its different systems, afford ample evidence of his assiduity and labour. Monthly Magazine. Gen. Biog.

TIEFENSEE, in *Geography*, a town of Prussia, on a lake of the same name; 20 miles S. of Brandenburg.

TIEFF, a town of Prussia, in the province of Bartenland; 7 miles S.E. of Angerburg.

TIEFFENAW, a town of Prussian Pomerelia; 15 miles S. of Marienburg.

TIELLEN-HEAD, a cape of the county of Donegal, on the west coast of Ireland. N. lat. $54^{\circ} 41'$. W. long. $8^{\circ} 40'$.

TIEM, a town of Asia, in the kingdom of Laos, on the Mecom; 90 miles S.S.E. of Lantchan.

TIEN, or **LIEN**, a city of China, of the second rank, in Quang-tong; 960 miles S. of Peking. N. lat. $24^{\circ} 50'$. E. long. $111^{\circ} 49'$.—Also, a town of Corea; 25 miles N.N.E. of King-ki-tao.—Also, a city of China, of the second rank, in Quang-si, on the north side of the Pofoi: 1120 miles S.S.W. of Rejing. N. lat. $23^{\circ} 46'$. E. long. $106^{\circ} 19'$.

TIEN-CHAN, a town of Corea; 53 miles W.N.W. of Han-tcheou.

TIENEN. See **TIRLEMONT**.

TIENGEN, or **THIENGEN**, or *Thungen*, a town of Germany, in the principality of Klettgau, on the Wutach, formerly, with its district, constituting a lordship; 29 miles E. of Balo. N. lat. $47^{\circ} 42'$. E. long. $8^{\circ} 17'$.

TIENHOVEN, a town of Holland, on the Leck;

6 miles S. of Schoonhoven.—Also, a town of Utrecht; 7 miles N. of Utrecht.

TIEN-SING, a great port of China, on the river Pei-ho. Its Chinese name literally signifies "heavenly spot;" and in the time of Marco Paolo, when it is supposed to have been much larger than at present, it was called "Citta Celeste:" and it is said to have a claim on this appellation from its situation in a genial climate, fertile soil, dry air, and serene sky. It is the general emporium for the northern provinces of China, and is built at the confluence of two rivers, from which it rises in a gentle slope. The palace of the governor stands on a projecting point, commanding a broad basin, or expanse of water, produced by the union of the rivers, and almost covered with vessels of different sizes. These two rivers are the Pei-ho and the Yun-leang-ho, or grain-bearing river, from the quantities of wheat conveyed upon it from the province of Shan-see, and sent up by the Pei-ho to the neighbourhood of Peking. Over these rivers, where they unite, is a bridge of boats: and along the quays were some temples and other handsome edifices, but the rest consisted chiefly of shops for the retail of goods, and also warehouses, together with yards, and magazines for maritime stores. The houses at Tien-sing are chiefly built of brick, of a leaden-blue colour. Few are red: the poorest are pale brown. Many of the houses are two stories high.

TIEN-TCHA, or *New Gibraltar*, a mountain of Cochinchina, which forms the harbour of *Turon*; which see.

TIENTONG, a town of Siam; 350 miles N.N.W. of Juthia.

TIEN-TSANG, a town of Thibet; 268 miles E.S.E. of Hami.

TIEPOLO, GIOVANNI BATISTA, in *Biography*, was one of the last of the eminent Venetian painters. He was born at Venice in 1697, and was a scholar of G. Lazzarini; but he afterwards studied the works of P. Veronese. He possessed a quick invention, and great freedom of hand, and was admirably qualified for the execution of large fresco works upon ceilings, &c.; where great facility of handling, and richness of colouring, will often apologize for the want of higher qualities, particularly in allegoric or grotesque subjects. Tiepolo was employed in many of the palaces in Italy, but most honoured by the employment he received from the king of Spain, who engaged him to adorn his palace at Madrid. He died at Madrid in 1770, at the age of 73. He etched many of his own designs with great neatness and taste.

TIER, in *Sea Language*, the name of the several ranges of guns mounted on one side of a ship's deck; which, according as they are placed on the lower, middle, or upper decks, are called the lower, middle, or upper tier.

TIER of the Cable, denotes a range of the fakes or windings of the cable, which are laid within one another in an horizontal position, so as that the last becomes the innermost.

TIER Cable, is the hollow space in the middle of a cable, when it is coiled.

TIER, in *Organ-Building*, is used to distinguish the different ranks or ranges of pipes (as a tier of guns in men of war) in the front of the instrument, and even in the interior of the case, when the compound stops have several ranks of pipes, as the sesquialter, furniture, and cornet.

TIERBY, in *Geography*, a town of Sweden, in the province of Halland; 6 miles S.E. of Helsingstad.

TIERCE', a town of France, in the department of the Mayne and Loire; 3 miles S. of Chateaufeuf.

TIERCE, or *Teirce*, in *Commerce*, a measure of liquid things,

things, as wine, oil, &c. containing the third part of a pipe, or forty-two gallons. See MEASURE.

The tierce is also a weight by which provisions are sold in Ireland. The tierces, barrels, and firkins are not tared, but the pieces in each cask must be of the following weight and number :

	lbs.		lbs.
<i>Beef.</i> —Navy	304	per tierce, being 38 pieces of 8 each.	
India	336	ditto - 42 - 8	
Mefs	304	ditto - 38 - 8	
Ditto	200	per barrel - 25 - 8	
Ditto	100	per firkin - 25 - 4	
<i>Pork.</i> —India	318	per tierce - 53 - 6	
Navy	320	ditto - 80 - 4	
Army	208	per barrel - 52 - 4	
Mefs	200	ditto - 50 - 4	
Ditto	100	per firkin - 25 - 4	

TIERCE, in *Music*, a 3d. The highest stop in an organ, called the tierce, is a major 3d above the 15th, every found being a 17th above the diapason. See THIRD.

TIERCE de Picardie, in *French Music*, and indeed all choral music of old masters in a minor key, is terminated with a sharp 3d, which the French now call *tierce de Picardie*, on account of the great number of cathedrals in that province, where it continues still in use.

Padre Martini (*Saggio di Contrap. parte prima, 23.*) recommends the terminating minor movements with a sharp 3d; a practice which Rousseau (*Dict. de Mus.*) censures as Gothic, and a proof of bad taste. If the first of these excellent writers wished only to preserve its use in the church, and the second to banish it elsewhere, they were both right, however their opinions may seem to clash. The learned author of the *Saggio di Contrappunto*, who was so perfectly acquainted with all the beauties and effects of choral music, is certainly more to be relied on in whatever concerns it, than the animated author of the *Dictionnaire de Musique*; who, with the most refined taste and exalted views with respect to dramatic compositions, had neither time nor opportunity sufficiently to explore the mysteries of canto fermo, or to become a very profound contrapuntist. For our own part, though we never wish to hear a song or glee in a minor key, and with a sharp 3d; yet there is something so solemn and grateful in these terminations of ecclesiastical compositions, that we should be very sorry if the practice were not continued. And if we consider the relation and composition of the several stops in an organ, we shall find, that as every single key in the chorus of that instrument has a complete chord with a sharp 3d to it, when we dwell on a chord with a flat 3d, while the tierce, cornet, sesquialter, and sometimes the furniture, are sounding the sharp 3d, it affords an additional reason for the origin and continuance of the practice, besides the peculiar properties of tonal modulation.

TIERCE, in *Gaming*, a sequence of three cards of the same colour.

TIERCE, in *Fencing*. See GUARD and THRUST.

TIERCE Order. See THIRD Order.

TIERCE Point. See THIRD Point.

TIERCED, **TIERCE**, in *Heraldry*, denotes the shield to be divided by any of the partition lines, party, coupy, tranchy, or taily, into three equal parts, of different colours or metals.

If the chief and base be of the same colour when divided by a fesse, they blazon it by expressing the colour, and mentioning the fesse; otherwise, they say, it is *tierce*

in fesse, and mention each of the colours, or *tierce in pale*, if so divided in pale.

TIERCEL, in *Falconry*, a name given to a male hawk, as being a third part less in size than the female.

TIERCELET. See TASSEL.

TIERDILL, in *Geography*, a town of Hindoostan, in Vishapour; 20 miles W. of Galgala.

TIERPIED, a town of France, in the department of the Channel; 3 miles E. of Avranches.

TIERRA. See TERRA.

TIERRA Bomba, a small island near the coast of South America, at the entrance of the harbour of Carthage: where, in 1741, the English erected a battery.

TIERY, a town of Sweden, in the province of Upland; 30 miles N. of Upsal.

TIES, aboard a ship, are those ropes by which the yards hang; and when the haliards are strained to hoist the yards, these ties carry them up.

TIESSERBACH, in *Geography*, a river of Wurtemberg, which runs into the Neckar, near Nurlingen.

TIETAR, a river of Spain, which runs into the Tagus, near Talavan, in Estremadura.

TIE-TCHEOU, a town of Chinese Tartary, in the country of Kokonor; 688 miles S.E. of Hami. N. lat. 33° 56'. E. long. 102° 54'.

TIETE, or **ANHEMBI**, a river of Brasil, which runs into the Parana.

TIFACOU, a word used by some of the chemical writers to express quicksilver.

TIFATA MONS, in *Ancient Geography*, a mountain of Italy, in Campania, near Capua. The table of Peutinger has placed here two temples, one designated by the words "Ad Dianam," the other by those of "Jovis Tifationus."

TIFATA, a town of Italy, in Latium. Pliny.

TIFATUM, a word used by some of the chemical writers to express sulphur.

TIFER, in *Geography*, a town of the duchy of Stiria; 3 miles S. of Cilley.

TIFERNUM, or **TIFERNUS**, in *Ancient Geography*, a river of Italy, in Samnium.

TIFERNUM Metaurum, a town of Italy, in Samnium. Livy.

TIFERNUM Tiberinum, or *Tifernum of the Tiber*, *Citta di Castello*, a town of Italy, in Umbria, to the N.W. towards the banks of the river Tiber. It was municipal.

TIFESELT, in *Geography*, a town of Fez; 12 miles N.E. of Sallee.

TIFFAUGES, a town of France, in the department of the Vendée; 9 miles E. of Montaigu.

TIFFE de Mer, in *Natural History*, a name given by count Marfigli to a species of sea-plant, as he supposes it to be, commonly but erroneously reckoned among the sponges, and called by authors a *branched sponge*. This author has called it by this name from its resemblance to the heads of the *typha palustris*, or cat's tail, when ripe in the month of September.

The sponges must be of a lax and cavernous texture; but this substance is smooth and firm, and has no inequalities on its surface, excepting a few short hairs, which give it a velvety look, when first taken out of the water. It is a very elegant and beautiful substance; it grows to two feet in height, and is very elegantly branched; it grows on rocks and stones, and, when first taken out of the sea, is full of a viscous water, as yellow as the yolk of an egg; but when this water is pressed out, and the substance dries, it loses its yellow, and becomes of a dusky-brown colour: it is very tough and firm while in the water, but when dry it usually

usually breaks of itself into little pieces, and may be crumbled to powder between the fingers. This is a very strong proof, among others, of its not being of the nature of the sponge.

When viewed by the microscope, the whole surface is found to be covered with extremely fine and slender hairs; and, among these, there is an infinity of little apertures, through which the sea-water makes its way.

When a branch of it is cut transversely, there are seen a number of long and fine canals, by means of which the water, received at these superficial apertures, is conveyed to its whole substance. Marfig. Hist. de la Mer, p. 82.

Substances of this kind are now known to be of animal and not of vegetable origin. See CORAL.

TIFFENETH, in *Geography*, a town of Prussia, in the province of Natangen; 10 miles S. of Brandenburg.

TIFFESCH, or TIFAS, anciently *Theveste*, a town of Algiers; 40 miles S. of Bona. N. lat. $36^{\circ} 20'$. E. long. $7^{\circ} 40'$.

TIFLISBERG, a mountain of Switzerland, between the cantons of Uri and Unterwalden.

TIGA, in *Ancient Geography*, a town of Africa, in Mauritania Cæsariana, near the coast of the Atlantic. Strabo.

TIGA, in *Geography*, a small island in the East Indian sea, near the north-west coast of the island of Borneo. N. lat. $6^{\circ} 25'$. E. long. $112^{\circ} 14'$.

TIGAON, an island in the Indian sea, near the north-west coast of the island of Borneo. N. lat. $6^{\circ} 10'$. E. long. $128^{\circ} 48'$.

TIGARA, in *Ancient Geography*, a town of Africa, in the interior of Mauritania Cæsariana. Ptol.

TIGAREA, in *Botany*, a barbarous or arbitrary name, of which its publisher Aublet has given no explanation.—Aubl. Guian. 917. Juss. 339. Lamarck Illustr. t. 826.—Schreber admitted the genus, under the name of *Rhinium*, in his Gen. 701, but in his *Addenda* to that work, 833, reduced it to *TETRACERA*; see that article. Mr. Pursh, however, has restored the genus and the name, in his *Flora America Septentrionalis*, 333, where he has, not without some doubt, referred hither a very curious new shrub, found in the meadows of the Rocky-mountains, and on the Columbia river, by the name of *T. tridentata*, t. 15. This has crowded, wedge-shaped, hoary, three-toothed leaves, and solitary, terminal, yellow flowers, the size of hawthorn-blossoms. That it is very distinct in genus from Aublet's *Tigarea* we have no doubt, being very nearly akin to the *Rubus japonicus* of Linnæus, *Corchorus japonicus* of Thunberg, as has lately been pointed out by M. De Candolle, in a paper read before the Linnæan Society. But it seems to us that the genus of neither of these shrubs can as yet be determined, for want of perfect fruit.

TIGAUDA, in *Ancient Geography*, a municipal town of Africa, in Mauritania Cæsariana, upon the route from Rufucurrum to Cala, between Castellum Tingitanum and Oppidum Novum. Anton. Itin.

TIGE, in *Architecture*, a French term for the shaft or fust of a column, comprehended between the astragal and the capital.

TIGEGUACU, in *Ornithology*, the name of a small Brazilian bird, of the size of a sparrow, and with a ridged and triangular bill, in which it resembles the mouche-rolle; its eyes are of a fine blue, and its legs and feet yellow; it is all over of a deep black, but that it has a large blood-red spot on the top of its head; its tail is short and black.

TIGELLIUS, in *Biography*, a musician, born in Sardinia, grandson of Phamea, a musician in great favour at Rome in the time of Julius Cæsar. Horace has handed him

down to posterity as a merciless spendthrift, and an egregious coxcomb.

“ Ambubajarum collegia Pharmacopolæ
Mendici, Mimæ, Balatrones, hoc genus omne
Mæstum, ac solicitum est cantoribus Tigelli:
Quippe benignus erat.”—Sat. lib. i. 2.

Tigellius was not only much in favour with Julius Cæsar, but afterwards with Cleopatra and Augustus; he was an able musician, an ingenious buffoon, and subtle courtier. What Horace has said of his caprice, has often been applied, and we fear will ever continue to be applied, to musicians of a similar disposition.

“ Omnibus hoc vitium ut cantoribus, inter amicos
Ut nunquam inducant animum cantare rogati;
Injussi nunquam desistant.”—Sat. lib. i. 3.

TIGENHAGEN, in *Geography*, a town of Prussian Pomerelia; 12 miles N. of Marienburg.

TIGENWIT, a town of Africa, in Negroland; 45 miles N. of Arguin.

TIGER, a small island in the Spanish Main, near the coast of Darien. N. lat. $8^{\circ} 35'$. W. long. $77^{\circ} 30'$.

TIGER, *Tigris*, in the Linnæan system of *Zoology*, is a species of cat, or *FELIS Tigris*; which see.

The tiger (formed of תיג, *fagitta*, a dart, whence תיג) has its name from its supposed swiftness. See the article *FELIS Tigris*.

TIGER, *American*. See *FELIS Onca*.

TIGER-Cat. See *FELIS Capensis*.

TIGER, *Hunting*, or *Leopard*. See *FELIS Leopardus*.

TIGER, *Man*. See *MANTEGAR*.

TIGER-Shell, a name given to the red voluta, with large white spots.

In the Linnæan system, the tiger-shell is a species of the cypræa. See *SHELLS*.

TIGGREE, in *Geography*, a town of Hindooistan, in the circar of Sumbul; 17 miles S. of Nidjibabad.

TIGH, in our *Old Writers*, a clofe or inclosure mentioned in ancient charters, and is still used in Kent in the same sense.

TIGHMAN'S ISLAND, in *Geography*, a small island in the Cheapeake. N. lat. $38^{\circ} 48'$. E. long. $76^{\circ} 21'$.

TIGHT, in *Sea Language*, expresses the quality by which a vessel resists the penetration of any fluid, whether compressing its surface, or contained within it. Hence a ship is said to be tight, when her planks are so compact and solid, as to prevent the entrance of the water in which she is immersed; and a cask is called tight, when the staves are so clofe, that none of the liquid contained in it can issue through or between them. In both senses, tight is opposed to leaky. Falconer.

TIGILLUM, a word used by some chemists to express the tile with which they cover the mouth of their crucibles; and, by others, for the crucible itself.

TIGILSKOI, in *Geography*, a town of Kamtschatka; 80 miles W. of Ukinfkoi. N. lat. $57^{\circ} 20'$. E. long. $157^{\circ} 44'$.

TIGINE. See *BENDER*.

TIGIS HERBA, in *Ancient Geography*, a town of Africa, in the interior of Mauritania Cæsariana, near a river, and S. of Icofium. In the Itin. of Anton. it is marked on the route from Rufucurrum to Scaldæ.

TIGLIUM, in *Botany*. See *PINEI Nuclei*, &c.

TIGNALE, in *Geography*, a town of the island of Corsica; 30 miles S.E. of Corte.

TIGNARES,

TIGNARES, a town of Brasil, and chief place in the captainship of Rio Grande.

TIGNES, a town of France, in the department of Mont Blanc; 3 miles S.E. of St. Maurice.

TIGRA, in *Ancient Geography*, a town of Lower Mæsia, on the route from Viminacium to Nicomedia, between Exantapristis and Appiaria. Anton. Itin.

TIGRAH, in *Geography*, a town of Hindoostan, in Bahar; 40 miles E.S.E. of Hajypour. N. lat. 25° 28'. E. long. 86° 7'.

TIGRANA, in *Ancient Geography*, a town of Asia, in the interior of Media. Ptol.

TIGRANAAMA, a town of Asia, in the Greater Armenia, and one of those which were situated to the E. of the sources of the Tigris. Ptol.

TIGRANES, the Great, in *Biography*, king of Armenia, after having been delivered by his father as a hostage to the Parthians, was liberated and assumed the crown about the year B.C. 93. Having formed an alliance with Mithridates, king of Pontus, against the Romans, he married Cleopatra, daughter of that prince; and, agreeably to the terms of his alliance, he reduced Cappadocia, and caused Ariarathes, the son of Mithridates, to occupy the throne instead of Ariobarzanes, who was supported by the Romans. Soon after this event, Tigranes was offered the crown of Syria, and accepted it B.C. 83; and when he had taken possession of the kingdom, governed it for many years by a lieutenant. He then invaded Lesser Armenia, and completely ruined it in the course of one campaign. Having made various other conquests, he founded the city of Tigranocerta, on the spot in Armenia where he had received the crown. He afterwards joined Mithridates, his father-in-law, in a war against the Romans; but when Mithridates, after having been defeated by Lucullus, took refuge in Armenia, he was coldly received by Tigranes, who granted him a castle for his residence, with a royal allowance. By a series of subsequent adventures, which proved successful, Tigranes was so elated, that he assumed the title of king of kings, and exacted from all who approached him tokens of the most humiliating reverence. A change however in his situation was rapidly approaching; for Lucullus, the Roman general, having reduced the kingdom of Pontus, availed himself of a preconcerted circumstance for marching in a hostile manner into Armenia, and laid siege to Tigranocerta. Tigranes advanced to its relief; but meeting with Lucullus at the head of a small army, an engagement ensued, the result of which was the pusillanimous flight of Tigranes, and the dispersion of his numerous army; and though he received considerable succour from Mithridates, and levied fresh troops, he could not prevent the surrender of Tigranocerta to Lucullus; and this surrender was followed by a signal defeat of the united forces of Mithridates and Tigranes; upon which the latter prince withdrew to the remotest part of his dominions. When Pompey succeeded Lucullus in the command of the Roman army, Mithridates and Tigranes, availing themselves of an interval of inaction, recovered Armenia and a great part of Pontus; but their success was interrupted by the rebellion of the son of Tigranes, who took up arms against his father; but being defeated, he sought refuge in Parthia, and persuaded Phraates, the sovereign of that country, to declare war against the Armenians. Phraates, with a numerous army under his command, compelled Tigranes to withdraw to the mountains, and besieged his capital Artaxata. The younger Tigranes being left in command of the Parthian army, was defeated by his father, who raised the siege of Artaxata. Tigranes afterwards joined

the Romans, and conducted Pompey into Armenia against his father. Unable to resist this invasion, he determined to surrender himself to Pompey, and to confide in his generosity. Upon being introduced to the presence of the Roman general, he took off his diadem, and prostrated himself at Pompey's feet. Pompey raised him, and replaced the royal diadem; and in compromising the dispute between the father and son, restored to the former the kingdom of Armenia, and the greatest part of Mesopotamia, but imposed upon him a fine of 6000 talents for making war upon the Roman people. He was also obliged to resign the crown of Syria, which he had held for eighteen years, and likewise the provinces of Cappadocia and Cilicia. From this time Tigranes was received as a friend and ally of the Roman people, and by maintaining their friendship, he was enabled to retain his dominions in peace to the end of his life, which terminated in the eighty-fifth year of his age. Anc. Un. Hist.

TIGRANOCERTA, SERED, in *Ancient Geography*, a town of Asia, in Greater Armenia, at some distance to the left of the Tigris, on the river Nicephorius, and N.W. of its mouth in the Tigris. This town was built by Tigranes, in the time of the Mithridatic war. According to Plutarch, it was large, handsome, populous, powerful, and rich. Tacitus reports that Tigranocerta was situated on an eminence, nearly surrounded by the Nicephorius, and that it was well fortified and garrisoned.

TIGRE, in *Geography*, a small island in the Pacific ocean, at the entrance into Amapalla bay. N. lat. 13° 10'. W. long. 88° 44'.

TIGRÉ, a province of Abyssinia, about 200 miles in length, and 120 in breadth. What in a special manner makes the riches of Tigré, is, that it lies nearest the market, which is Arabia; and all the merchandize destined to cross the Red sea must pass through this province, so that the governor has the choice of all commodities wherewith to make his market. The strongest male, the most beautiful female, the purest gold, the largest teeth of ivory, all must pass through his hand.

TIGRIDIA, in *Botany*, the *Flos Tigridis* of old authors, so called from its beautifully spotted corolla, resembling the skin of a tiger, or rather of a leopard or lynx. This fine Mexican plant, being known to systematic botanists from early engravings only, did not find a place in their arrangements, till Mutis sent a drawing of it to Linnæus, under the name of *Pavonia*, in honour of one of his ablest pupils, Pavon, as appears by his letters; and not, as some have supposed, because of any resemblance in the spots of the flower to a peacock's tail. Being judged a *Ferraria*, it was referred to that genus in the *Supplementum*; but Jussieu, and after him Mr. Gawler, has restored the genus of Mutis, under the above name, there being another *PAVONIA*, which the reader may see in its proper place.—Juss. Gen. 57. Gawler, (now Ker Bellenden,) in Sims and Kon. Ann. of Bot. v. 1. 246. Ait. Hort. Kew. v. 4. 137. (Ferraria; Lamarek Illustr. t. 569.)—Class and order, *Monadelphica Triandria*. Nat. Ord. *Enfateæ*, Linn. Gawler. *Irides*, Juss.

Gen. Ch. *Common Sheath* two-edged, of two compressed pointed valves; *partial* ones smaller, two-ranked, alternate, single-flowered. Perianth none. *Cor.* superior, regular, of six petals; the three outermost ovate-oblong, acute, concave at the base; slightly contracted towards the middle: three innermost much smaller, oblong-fiddle-shaped, pointed, convex, recurved, hastate at the base. *Stam.* Filaments three, firmly united into a triangular, abrupt, erect column, longer than the inner petals; anthers sessile at the top of the column,

column, erect, linear-oblong, acute, converging at the points, bursting externally. *Pist.* Germen oblong, abrupt, with three rounded angles; style thread-shaped, rather longer than the column of the stamens; stigmas three, slender, acute, deeply divided. *Peric.* Capsule oblong, bluntly triangular, abrupt and scarred at the top, of three cells and three valves, the partitions from the centre of each valve. *Seeds* numerous, nearly globose, ranged in a double row in each cell, somewhat angular from mutual pressure.

Ess. Ch. Common Sheath of two leaves. Calyx none. Petals six; the three inner ones smallest, fiddle-shaped, pointed. Stigmas linear, deeply cloven. Capsule of three cells, inferior.

1. *T. Pavenia.* Mexican Tiger-flower. Redout. Liliac. t. 5. Gawler n. 1. Ait. n. 1. (*Ferraria pavonia*; Linn. Suppl. 407. Willd. Sp. Pl. v. 3. 581. Cavan. Diss. 342. t. 189. f. 1. Andr. Repof. t. 178. F. Tigridia; Curt. Mag. t. 532. Ocoloxochitl, feu Flore Tigris; Hernand. Mex. 276. Tigridis flos; Dodon. Pempt. 693. Ger. Em. 122.)—Native of Mexico and Peru. Said to have been first introduced into the gardens of this country, about the year 1796, by Ellis Hodgson, esq. of Everton, near Liverpool, who liberally communicated it to the nurserymen about London, so that now few ornamental flowers are more easily obtainable. If treated as a greenhouse plant, like the Cape bulbs, the *Tigridia* flowers in spring, ripening abundance of seeds. If planted in the open ground in March or April, the more dry or sandy the soil the better, it will blossom in succession through the autumn, at the end of which the bulbs should be taken up, carefully dried, freed from their very succulent fibres, and preserved from frost till the following spring. Though each flower lasts but one day, as every plant bears several, a plentiful succession may readily be had. The root is an ovate bulb, which is eatable when roasted, tasting like a chestnut; from its base are sent down several long, perpendicular, tapering, very juicy, downy fibres. *Stem* two or three feet high, erect, round, leafy, somewhat branched. *Leaves* several, erect, sword-shaped, many-ribbed, plaited, smooth, a foot long. *Flower* inodorous, three or four inches broad, so splendidly variegated with scarlet, crimson, purple and yellow, that no description can do it justice. The ends of the larger petals are scarlet; their middle yellow; their base, like the whole surface of the smaller ones, richly spotted. *Stamens* and *pistil* red. It increases by bulbous offsets, as well as by seeds.

TIGRINI, ORAZIO, in *Biography*, a canon of Arezzo, who published at Venice, in 1588, a Musical Compendium; "Compendio della Musica," which he dedicated to Zarlino, from whom he received a letter of thanks for the laurel-crown with which he had bound his brows; which letter is prefixed to the work, with complimentary verses innumerable from other friends. This Compendium is not only well digested by the author, but rendered more clear and pleasant in the perusal, by the printer, who has made use of large Roman types, instead of Italic, in which most of the books that were published in Italy, before the present century, were printed. This author is the first, in our recollection, who has censured the impropriety and absurdity of composing music for the church upon the subject of old and vulgar ballad tunes. The cadences which he has given in three, four, five, and six parts, and which are good examples of ecclesiastical counterpoint, have been almost all used by Morley, without once mentioning Tigrini's name, either in the text or catalogue of authors whom he has cited. Zarlino, who had adopted the four new ecclesiastical tones proposed by Glareanus, was followed by Tigrini, with whom they seem to have stopped: as no more than the eight ancient tones ap-

pear afterwards to have been acknowledged by orthodox ecclesiastical composers; and Zarlino himself, in the last editions of his works, relinquished the idea of twelve modes: as no new harmony or modulation was furnished by the additional four to the contrapuntist, without violating the ancient rules of canto-fermo, which confine all its melody to the different species of octave. It appears from this Compendium, that *contrapunto alla mente*, or extemporary discant upon a plain-song, was still practised in the churches of Italy.

TIGRIS, in *Ancient and Modern Geography*, a large river of Asia, which has its source in the mountains of Greater Armenia, about 15 miles S. of the sources of the Euphrates, and pursues nearly a regular course S.E., until its junction with that river at Korna, 50 miles above Bassora. Formerly these rivers discharged themselves separately into the Persian gulf; but they now fall into the sea by a common canal, about 70 miles S. of Bassora. In the time of Pliny their separate beds might be seen. According to the same author, it was named "Deglito," from its source to mount Taurus, which it traversed; and from the place of its discharge on the other side of the mountain, to the sea or Persian gulf, it was called Tigris. This author says that it passed through the lake of Arethusa, without mixing its waters with those of the lake. Strabo and Arrian denominated the mouth of the Tigris "Pafitigris," and Pliny gives this name to that part of the river which separated into two arms, that, after enclosing an island, joined again, and fell into the same bed. Moses (Gen. ii. 14.) calls this river, as it has been supposed, Hiddekel. The cavern of mount Taurus, through which it is said to have passed, was called "Zoroanda;" and as a proof that it was the same river which entered the cavern and passed out of it, any substance thrown into the river on one side of the mountain was discharged by it on the other.

The ancient Persians called this river "Teer," the arrow, from the rapidity of its current; and it is now called "Degila," and "Shat-Bagdad," the river of Bagdad. The united rivers of the Tigris and Euphrates are denominated "Shat-ul-Arab;" which see.

The Tigris, though a far less noble stream than the Euphrates, is one of the most celebrated rivers in history; and many famous cities have, at different periods, decorated its banks; among which we may reckon, in ancient times, those of Nineveh, Seleucia, Ctesiphon; and in subsequent periods, those of Bagdad, Mosul, Diarbekir, &c.

This river is navigable for boats of twenty or thirty tons burthen as far as the mouth of the Odorneh, but no farther; and the commerce of Mosul is consequently carried on by rafts, supported by inflated sheep-skins. The rafts are floated down the river, and when arrived at Bagdad, the wood of which they are composed is sold without a loss, and the skins conveyed back to Mosul by camels. The Tigris is, on an average, between Bagdad and Korna, about 200 yards wide. The banks are steep, and, for the most part, overgrown with brush-wood, the haunt of lions and other wild beasts. The Tigris rises twice in the year; the first and great rise is in April, and is caused by the melting of the snows in the mountains of Armenia; and the other is in November, produced by the periodical rains. A boat, with a fair wind, will sometimes pass from Bagdad to Bassora in six days, but the common passage is from eight to ten.

The banks of the Tigris, from Tauka-Kelra to Korna, cannot boast of a single village, or even habitation, with the exception of Koot, a miserable place, containing 40 or 50 mud-huts. The city of Wafith, repeatedly mentioned in the Arabian histories, is no longer a place of any consequence; it stands on the banks of the Hye, or great canal. From Korna to the neighbourhood of Bassora, Bassara or

Basra, there is little or no cultivation; but from thence the country bordering on the banks of the river is covered with plantations of date-trees, which continue, without interruption, almost to the mouth of the Shat-ul-Arab.

TIGRIS Fons, a fountain of Asia, in the mountains S. of Maxoene, which formed a stream that ran towards the S.E. and discharged itself into the lake Arethusa.

TIGRIS, in *Geography*, a river of China, between Canton and the sea, so called by Europeans.

TIGRIS, in *Zoology*. See **FELIS Tigris**.

TIGUAZALPA, in *Geography*, a town of Mexico, in the province of Nicaragua, on a river which runs into Amapalla bay; 80 miles N. of Leon. N. lat. $13^{\circ} 50'$. W. long. $87^{\circ} 36'$.

TIGUILLACA, a town of Peru, in the diocese of La Paz; 10 miles N. of Puno.

TIGURINI, in *Ancient Geography*, a people of Gaul, who established themselves in a canton of the Helvetians, and who joined the Cimbri when they made an attempt to pass into Italy.

TIGURINUS PAGUS, one of the four cantons which composed the Helvetic confederacy; supposed to be Zurich.

TIGUTIA, a place of Italy, in Liguria, N.E. of Monilia.

TIGY, in *Geography*, a town of France, in the department of the Loiret; 12 miles S.E. of Orleans.

TIHAN, a town of Hungary; 20 miles S.W. of Stulweifenburg.

TIHOE, a bay on the S. coast of the island of Bouro. S. lat. $3^{\circ} 44'$. E. long. $126^{\circ} 27'$.

TIHOL, in *Natural History*, a name given by the people of the Philippine islands to a species of crane very frequent among them, and remarkable for its size, being taller than a man when it stands erect, and holds up its neck. They call it also sometimes *tipul*.

TIIB, EL, in *Geography*, a town of Persia, in the province of Chufistan, on the Ahuaz river; 70 miles N.W. of Toitar.

TIJEGUACU-PAROARA, in *Ornithology*, the name of a Brazilian bird, of the size of a lark; it has a short and thick beak, brown above and whitish below; its head, throat, sides, and the lower part of its neck, are of a fine yellow, variegated with red in the female, and all over of a perfect blood-red in the male; the upper part of the neck, and the whole back, are grey, with a mixture of brown; the wings are brown, tipped with white; the tail is of the same colour; and the sides of the neck, the breast, belly, and thighs, are white. Marggrave's Hist. Brasil.

TIJEPIRANGA, the name of a Brazilian bird of the sparrow kind. It is a little larger than the lark; its whole body, neck, and head, are of a very fine red or blood colour, and its wings and tail black.

There is another species also of this bird, which is of the size of a sparrow, and is of a blueish-grey on the back, white on the belly, and of a sea-green on the wings; the legs of this are of a pale grey. Marggrave's Hist. Brasil.

TIJOLA, in *Geography*, a town of Spain, in the province of Granada; 5 miles S.W. of Purchena.

TIJOUCA, a cultivated valley of the Brazils, in the vicinity of Rio de Janeiro, situated, as it were, in the bottom of a funnel, being surrounded on all sides by mountains, excepting to the southward, where a small opening admits an arm of the sea. The valley is watered by a clear stream, precipitated down a steep and broad rock of granite, forming a magnificent cascade. The soil requires little labour of cultivation: indigo, manioc, coffee, cacao or chocolate

trees, sugar-canes, plantains, and orange and lime-trees growing promiscuously, and some spontaneously, in the space of twenty square yards. Coffee and indigo claim the chief attention. The temperature of the valley is very hot, on account of its confined situation and the reflection of the mountains. Fahrenheit's thermometer in the shade about four in the afternoon stood at 88° . Staunton's Emb. to China, vol. i.

TIIZ, or **TIZ**, a town of Persia, in the province of Mecran, at the mouth of the Kurene; 75 miles S. of Kidge. N. lat. $25^{\circ} 25'$. E. long. $60^{\circ} 24'$.

TIKAX, a town of Mexico, in Yucatan; 68 miles S. of Merida.

TIKE, the Zetland name for an otter; of which there are many to be found about that island. Phil. Trans. N^o 473, sect. 8.

TIKE is also used for a small bullock or heifer, for a particular sort of worm, and in Scotland for a dog.

TIKIOB, in *Geography*, a town of Denmark, in the island of Zealand; 4 miles S.W. of Helsingoer.

TIKITHOCKTHOCK, a settlement on the E. coast of Labrador. N. lat. $56^{\circ} 15'$. W. long. $60^{\circ} 5'$.

TIKOO, a town of Bengal; 30 miles S.W. of Ramgur. N. lat. $23^{\circ} 29'$. W. long. $84^{\circ} 55'$.

TIKOTSCHIN, a town of the duchy of Warsaw; 24 miles N. of Bilesk.

TIL, a town of Persia, in the province of Adirbeitzan; 60 miles N.W. of Tauris.

TILA NAVI, one of the Lipari islands; 6 miles S.S.W. of Stromboli.

TILAMUNGALUM, a town of Hindoostan, in Myfore; 5 miles S. of Ouffoor.

TILBORG, a town of Brabant, celebrated for its manufacture of cloth; 10 miles S. of Bois-le-Duc.

TILBURREAH, a town of Bengal; 30 miles N.N.E. of Doega.

TILBURY, a township of Upper Canada, near lake St. Clair.

TILBURY, *West*, a village and parish in the hundred of Barstable, and county of Essex, England; is situated 24 miles S. by W. from Chelmsford, and 27 E. by S. from London. It appears to have been an episcopal seat of Cedda, bishop of the East Saxons, who in the 7th century propagated the Christian religion in this county, and built churches in several places, but "especially," as Bede reports, "in the city, which, in the language of the Saxons, is called Ythancestre; and also in that which is named Til-laburgh (the first of which places is on the banks of the river Pant, the other on the banks of the Thames), where gathering a flock of servants of Christ, he taught them to observe the discipline of a regular life, as far as those rude people were then capable." Ythancestre is supposed to have stood at the mouth of the river Pant, or Blackwater, but has been entirely engulfed by the sea. Tilbury is now only a small village, containing, as the return of the year 1811 states, 44 houses and 117 inhabitants. A medicinal spring was discovered here in the year 1727, of great efficacy in cases of hæmorrhage, scurvy, and some other disorders. (See **TILBURY-WATER**.) The marshes in this, and the contiguous parishes, are chiefly rented by the grazing butchers of London, who generally stock them with Lincolnshire and Leicestershire wethers, which are sent hither about Michaelmas, and feed till Christmas, when they are conveyed to the metropolis for sale.

On the banks of the Thames, in this parish, is Tilbury-Fort, originally built as a kind of block-house by Henry VIII., but enlarged into a regular fortification by Charles II., after the Dutch had sailed up the river in the

year

year 1667, and burnt three English men of war at Chatham. Various additions have been since made; and it is now strongly garrisoned, and defended by a great number of guns. Some traces of the camp formed here to oppose the threatened invasion of the Spanish armada, in the time of Elizabeth, are yet visible.—*Beauties of England and Wales*, vol. v. Essex; by J. Britton and E. W. Brayley.

TILBURY-Water, in *Medicine*, is an acidulous or saline water, issuing from a spring situated near a farm-house at West Tilbury, near Tilbury-Fort, in Essex. This water is of a straw-colour, soft and smooth to the taste, but leaving, after agitation in the mouth, a small degree of roughness on the tongue; it throws up a scum variegated with several colours, which feels greasy; and effervesces with spirit of vitriol; it mixes smooth with milk, but curdles with soap; when boiled, it turns milky, but is fined by a fourth part of mountain-wine, and by acids; it operates chiefly by urine, though it is somewhat purgative, and increases perspiration. This water is esteemed for removing glandular obstructions, and hence is also recommended in scurvy and cutaneous diseases; it is good in bloody fluxes, purgings, and the like: in disorders of the stomach arising from acidity, in the gravel, fluor albus, and immoderate flux of the menses. As a diuretic, it is beneficial in dropical complaints. It gently warms the stomach, strengthens the appetite, and promotes digestion. The usual dose is a quart a-day. This water is supposed to owe its virtue to a native alkaline salt, which may be obtained from it by evaporation, and to its fixed air, which, however, being very volatile, soon exhales when the water is heated or stands for some time exposed. Elliot's Account of Mineral Waters, &c. p. 220.

TILCARA, in *Geography*, a town of South America, in the province of Tucuman; 32 miles N.N.W. of St. Salvador de Jugui.

TILDIZ DAGHI, a mountain of Asiatic Turkey; 10 miles S. of Tocat.

TILE. See **TYLE**.

TILES, *Draining*, in *Agriculture*, such as are made of particular forms and dimensions, for the purpose of draining and taking away the water that stagnates in or upon land. They are said to constitute a very neat and convenient, as well as cheap and beneficial material for this use in a great many cases, especially as they are exempt from the common duties on ordinary tiles and bricks. They have the advantage too of being capable of being laid with much facility and dispatch, and of requiring less cutting than in the methods usually had recourse to in the common practice of freeing land from wetness. They are made and employed in some districts, as Cheshire, &c. with complete success and much utility.

TILE-Earth, that sort of earthy material of the strong clayey kind which is used in the making of tiles. It is also a term in farming which is sometimes employed to signify a strong, stiff, stubborn sort of land or soil that cannot be brought into cultivation, and be managed without very great labour, trouble, and expence, but which, when once reduced and got into order, is, in some cases, very productive and lasting in its returns.

Vast strength of men and teams is often requisite in working such lands as farms, as they cannot be effectually improved and got into a proper state, except by the application and incorporation of large quantities of different proper rich earthy and other suitable substances.

The farmer should always calculate well before engaging farms consisting greatly of this sort of land or soil.

The general opinion among the most attentive and diligent farmers in the county of Essex is, that even the

pasture lands upon the wet, cold, tile-earth bottoms, should be kept under the plough two or three years in twenty, in order to render them in the most suitable and productive state.

TILE, or *Tyle*, in *Affaying*, a small flat piece of dried earth, used to cover the vessels in which metals are in fusion.

These are made of a mixture of clay and sand, or powder of flints, or broken crucibles, made into a paste, and spread thin with a rolling-pin, on a table or flat stone. From these cakes or plates, pieces are to be cut with a knife, to the shape and size of the mouths of the vessels to be closed. It is best then to pare away the borders of the under surface of the piece thus cut off, that this surface may immediately touch all the way the edge of the mouth of the vessel, leaving a prominent rim, by which means the tile fits close upon the vessel, and is not so easily displaced by accidents, as a touch of the poker, or of the coals put on to mend the fire, as it otherwise would be. Finally, put on the middle of the outer surface a small bit of the same matter, which serves as a kind of handle, by means of which it may be conveniently managed by the tongs, and easily taken off and put on again at pleasure. Cramer, Art. Ass. p. 66.

TILENUS, DANIEL, in *Biography*, a doctor and professor of theology at Sedan, in France, was born in Silesia, in 1563, and was the first foreigner who wrote against Arminius, though he afterwards changed his opinion and supported the doctrine of that theologian. He also took part in a violent controversy with Du Moulin. A reconciliation was attempted between the disputants, in which the elector palatine, the duke de Bouillac, and king James I. of England, interposed; and a national synod of the French churches was held for this purpose at Tonneins in 1614. The attempt to produce a pacification failed; and Tilenus was deprived of his professorship in 1619 or 1620. He then removed to Paris, and afterwards maintained for five days, at Orleans, a disputation with John Cameron on grace and free-will. In a letter addressed to the people of Scotland, he accused the Presbyterians of introducing too many changes in the form of their religion, and praised the people of England for admiring episcopacy. King James I. caused this letter to be printed, and invited the author to England, with an offer of a pension. Tilenus accepted the offer; but returning to France in order to arrange his affairs, an outcry was in the meanwhile raised against him in England, and he therefore determined to remain at Paris, where he died in 1633. He was the author of many works in Latin and French, which it is needless to recite. Gen. Biog.

TILGUN, in *Geography*, a town of Asiatic Turkey, in Caramania; 36 miles E.N.E. of Akshehr.

TILHARA, a town of Hindoostan, in Rohilcund; 30 miles S.S.E. of Bereilly.

TILIA, in *Botany*, the Lime-tree, or Linden-tree, an ancient Latin name, whose origin may perhaps be found in the Greek *πτελεα*, the *Elm*; but on this subject nothing certain, nor indeed very plausible, has been made out by etymologists.—Linn. Gen. 267. Schreb. 355. Willd. Sp. Pl. v. 2. 1161. Mart. Mill. Dict. v. 4. Ait. Hort. Kew. v. 3. 299. Venten. in Sims and Kön. Ann. of Bot. v. 1. 207. Sm. Fl. Brit. 571. Prodr. Fl. Græc. Sibth. v. 1. 362. Pursh 362. Juss. 292. Tourn. t. 381. Lamarck Illustr. t. 467. Gært. t. 113.—Class and order, *Polyandria Monogynia*. Nat. Ord. *Columniferae*, Linn. *Tiliaceae*, Juss.

Gen. Ch. *Cal.* Perianth inferior, of one leaf, in five deep, concave, coloured, deciduous segments, about as large as the corolla. *Cor.* Petals five, alternate with the calyx, oblong, obtuse, crenate at the summit. Nectary a scale at the base of each petal, not universal. *Stam.* Filaments nu-

merous, thread-shaped, the length of the corolla; anthers of two nearly orbicular divaricated lobes, bursting outwards. *Pist.* Germen superior, roundish; style thread-shaped, the length of the stamens; stigma obtuse, with five angles. *Peric.* Capsule globose, angular, coriaceous or membranous, bursting tardily at the base, of five valves and five cells. *Seeds* solitary, roundish.

Obf. Two or three of the cells are generally abortive and obliterated. The nectary seems confined to the American species.

Ess. Ch. Calyx in five deep segments, deciduous. Petals five. Capsule superior, roundish, angular, of five cells, and five valves.

An important genus, of useful, as well as ornamental, hardy deciduous trees. The bark serves for cordage, and for those very serviceable mats, manufactured in Russia, so well known to our gardeners, and so useful for packing. The smooth, soft, white, close-grained wood is esteemed by carvers, and was preferred by the inimitable Gibbons, for those festoons of flowers, fruit, dead game, &c. with which his free and expeditious hand adorned most of the great houses in England. The leaves are sometimes given to cattle in seasons of scarcity in the North. The whole plant abounds with mucilage, and the sap is reported to afford some sugar. Nothing is more deliciously fragrant than the flowers of the whole genus, which bees frequent in great numbers, as they yield plenty of honey.

Section 1. *Flowers without the scaly nectaries.* European species.

1. *T. europæa.* Common Smooth Lime-tree. Linn. Sp. Pl. 733. Willd. n. 1. Ait. n. 1. Fl. Brit. n. 1. Engl. Bot. t. 610. Fl. Dan. t. 553. (*T. platyphyllos*; Scop. Carn. v. 1. 373? Venten. n. 2. *T. vulgaris platyphyllos*; Bauh. Hist. v. 1. p. 2. 133. Raii Syn. ed. 2. 316. *T. foemina*; Ger. Em. 1483.)—Nectaries none. Capsule coriaceous. Leaves heart-shaped, undivided; smooth and somewhat glaucous beneath, with the branching of their veins woolly. Branches and footstalks smooth.—Native of woods and the borders of meadows, or the slopes of hills, in various parts of Europe, from Sweden to Greece, flowering early in July. A tall upright tree, with smooth, spreading, round branches, green when tender, afterwards brown. Leaves alternate, on longish stalks, pointed, sharply serrated, almost orbicular, about three inches in diameter, entire at the base, and their sides rather unequal or oblique in that part: their upper surface of a full bright green, quite smooth: under paler, somewhat glaucous, with a yellowish prominent midrib, and several other ribs, either opposite from the central one, or radiating from the base, subdivided, connected by parallel transverse veins, all smooth as well as the surface of the leaf, except at the base of each side-rib, where is a small, depressed, axillary, fringe-like tuft of hairs. *Stipulas* none. *Flower-stalks* axillary, solitary, shorter than the leaves, smooth, slender, each bearing an irregular umbel or cyme of yellowish flowers, and very remarkable for a large, solitary, oblong, obtuse, entire, veiny bractea, of a pale greenish hue, and smooth surface, united firmly to the stalk, and falling off with it. The germen is very woolly. *Capsule* obovate, or angular, especially when it ripens more than one seed, which is not often the case. The flowers are delightfully fragrant, especially at night. This is the kind of Lime most usually planted for avenues, nor can any thing be more desirable for that purpose. It appears to have taken place of our more ancient elms in king William's time, when also it was equally popular in France. The branches naturally feather down to the ground, but will bear clipping without injury. The leaves fall perhaps the first of all our native

trees, especially in the squares of London, where the Lime nevertheless bears the smoky atmosphere tolerably well. Whether the *T. ulmifolia*, *femine hexagono* of Merrett, mentioned by Dillenius in his edition of Ray's *Synopsis*, 473, be a variety of this, with more perfect fruit, or of any other species, we have no means of determining.

2. *T. corallina.* Red-twigged Downy Lime-tree. (*T. europæa* β ; Ait. Hort. Kew. ed. 1. v. 2. 229. ed. 2. n. 1. γ ; Fl. Brit. n. 1. *T. grandifolia*; Ehrh. Arb. n. 8. *T. foliis molliter hirsutis, viminibus rubris, fructu tetragono*; Raii Syn. ed. 2. 316.)—Nectaries none. Capsule coriaceous. Leaves heart-shaped, undivided; downy beneath, with the branching of their veins woolly. Branches and footstalks downy.—Native of various parts of Europe. Plentiful in Stoken-church woods, Oxfordshire, where it was first noticed by Bobart, and where its shining red twigs are very conspicuous. This character, however, is not invariable. We have the same species in Norfolk with brown twigs, and it seems to be often planted indifferently with the former. They have not yet been separated as species, nor did Ehrhart, in publishing the present under the appellation of *grandifolia*, mean any thing further than to distinguish it, in common with the foregoing, from his *parvifolia*, hereafter described. We therefore prefer an older and less ambiguous name. Professor Mertens, who has studied these trees in Germany, observes that *corallina* flowers a fortnight earlier than *europæa*. As to their specific difference, it appears chiefly to depend on the fine soft hairs, which clothe the backs of the leaves, and especially cover their ribs, fringing their minutest veins in a delicate and regular manner. These hairs are condensed into little axillary tufts, at the origin of each principal vein. In the *inflorescence* or *flowers* we perceive no material difference. The capsule has four or five angles. The famous old Lime in the church-yard of Zedlitz near Guttenberg, in Bohemia, which is said to have borne hooded leaves, since a parcel of monks were hanged upon it, proves, by an authentic specimen sent us by professor Jacquin, to be this species, not the foregoing.

3. *T. parvifolia.* Small-leaved Lime-tree. Ehrh. Arb. n. 36. Pl. Off. n. 125. Sm. Engl. Bot. t. 1705. Ait. n. 2. "Schkuhr Handb. v. 2. 72. t. 141." (*T. microphylla*; Venten. n. 1. Sav. Etrusc. v. 1. 152. *T. europæa* β ; Fl. Brit. n. 1. *T. ulmifolia*; Scop. Carn. v. 1. 374. *T. sylvestris*; Trag. Hist. 1111. *T. folio minore*; Bauh. Hist. v. 1. p. 2. 137. Raii Syn. ed. 2. 316. *T. bohémica*, &c.; Till. Pif. 165. t. 49. f. 3.)—Nectaries none. Capsule roundish, very thin. Leaves heart-shaped, sharply serrated, somewhat lobed; smooth and glaucous beneath, with dense, axillary or scattered, tufts of hair.—Native of Germany, Carniola, Switzerland, Italy, France, and England. Ray says it frequently occurs in Essex and Suffex, as well as Lincolnshire and elsewhere. It flowers a month later than even the first species, not being in full perfection before August. The leaves are but about half the size of either of the foregoing, their serratures sharper, tufts of axillary hair larger, and often accompanied by large hairy blotches. *Footstalks* slender, and often of a longer proportion, quite smooth. *Flowers* smaller, smelling like a Honeyfuckle. *Capsule* small, roundish, scarcely angular, rarely perfecting more than one seed, its coat thin and tender compared with either of the former species, on which circumstance M. Ventenat chiefly founded its distinctive character. We do not find that part so unlike them in firmness, as in thickness; but we have no doubt of the species being perfectly distinct. By planting this intermixed with the others about houses, in avenues, &c. a longer

TILIA.

longer successions of fragrance from their blossoms might be obtained.

Seft. 2. *Flowers with scaly nectaries.* American species.

4. *T. americana.* Broad-leaved Lime-tree. Linn. Sp. Pl. 733. Willd. n. 2. Ait. n. 3. (*T. glabra*; Venten. n. 3. "Mem. de l'Inst. v. 4. 9. t. 2." Pursh n. 1. *T. canadensis*; Michaux Boreal-Amer. v. 1. 306.)—Nectaries present. Leaves orbicular-heart-shaped, abrupt with a point, sharply serrated; their veins minutely hairy beneath. Petals abrupt, crenate. Capsule ovate, somewhat ribbed. In the woods of Canada and the northern United States, and on the mountains, as far as South Carolina, flowering in May and June. It is known by the name of Lime-tree or Line-tree, Bals-wood, or Spoon-wood, and is both useful and ornamental. Pursh. Kalm first made the plant known to Linnæus, and it was supposed by them to be the only American species of *Tilia*. The stem is said to be eighty feet high. The branches are brown, smooth. Leaves larger than any of our European species, and of a more orbicular or rather elliptical form, abrupt rather than heart-shaped at their base; of a fine green above, turning red in autumn; much paler beneath; finely veined and smooth on both sides, except that all their veins are minutely hairy (not fringed like *T. corallina*) beneath, and even the smaller ones, as well as the larger, are furnished with little axillary hairy tufts. Flowers corymbose; their common stalk about twice the length of the footstalks. Petals, according to Ventenat, abrupt, and toothed towards the end. We have not examined the flowers.

5. *T. laxiflora.* Panicked Lime-tree. Michaux Boreal-Amer. v. 1. 306. Pursh n. 2.—"Leaves heart-shaped, taper-pointed, sparingly toothed, membranous, smooth. Panicles loose. Petals emarginate, shorter than the style. Capsule globose."—Near the sea-coast, from Maryland to Georgia, flowering in May and June. A very distinct species, though generally confounded with the foregoing one. Pursh.

6. *T. pubescens.* Hoary Lime-tree. Ait. n. 4. Willd. n. 3. Venten. n. 4. "Mem. de l'Inst. v. 4. 10. t. 3." Pursh n. 3.—Nectaries present. Leaves heart-shaped, pointed, coarsely serrated; abrupt and unequal at the base; downy beneath. Panicles forked, compound. Petals acute.—In close copies, and on the banks of rivers, from Virginia to Georgia, flowering from May to July. Pursh. Its thinner-leaved variety was long ago brought from Louisiana to the Paris gardens, and Jussieu gave it the name of *multiflora*, which is very apt, but has never been published till lately. Catesby is reported to have introduced this species into England before the year 1726. If our memory does not deceive us, it is to be met with at Bullfrode, and in other old plantations, and the flowers are more highly fragrant than any others of the genus. Its growth is said not to be so lofty as that of *T. americana*. The leaves are smaller, obliquely heart-shaped, with very broad and pointed serratures; their under side extremely soft to the touch, but not white, though paler than the upper, and somewhat hoary. There are scarcely any axillary tufts of hair to the veins, except on the older denuded leaves. Flower-stalks twice as long as the footstalks, branched at the top into a forked, spreading, downy panicle of numerous flowers. The petals are rather pointed, as Ventenat describes them; and not emarginate, as in his and Pursh's specific definition. We readily concur with these authors, that the Louisiana tree, called *multiflora*, is a mere variety, and but a slight one. Our description of the *inflorescence* and *flowers* is taken from this variety. It is hardly necessary to mention

that all these American Lime-trees bear the same peculiar sort of *bractea* as those of Europe.

7. *T. alba.* White Lime-tree. Ait. n. 5. Willd. n. 4. "Waldst. et Kitaib. Hung. t. 3." Jacq. Hort. Schoenbr. v. 3. 18. t. 283. (*T. rotundifolia*; Venten. n. 5. "Mem. de l'Inst. v. 4. 12. t. 4.")—Nectaries present. Leaves deeply heart-shaped, obscurely lobed, sharply serrated; downy and white beneath.—Native of woods in Hungary. Willdenow. Found by Bruguière and Olivier near Constantinople. Ventenat. It was erroneously reported by our gardeners to come from America, as every new plant, at one period, was supposed to do. More recently, every novelty has been attributed to Botany Bay.—This is a hardy tree in England, but does not flourish so well as any of the preceding. The deep, and more even, heart-shaped figure of the leaves, and their snow-white under surface, readily characterize this species. Its light-yellow, cymose or paniced flowers are said to have the scent of a jonquill.

8. *T. heterophylla.* Various-leaved Lime-tree. Venten. n. 6. "Mem. de l'Inst. v. 4. 16. t. 5." Pursh n. 4. (*T. alba*; Sm. Inf. of Georgia, v. 1. 21. t. 11?)—"Leaves ovate, sharply serrated; white and downy beneath; either heart-shaped, or obliquely, or equally, abrupt, at the base. Capsule globose, obscurely ribbed."—On the banks of the Ohio and Mississippi, flowering in June. A very handsome and desirable ornamental tree. Pursh. Ventenat says it is distinguished from the last by many characters. The young branches, and buds, are smooth, of a purple colour inclining to black. Leaves delicately serrated, pointed, with tufts of reddish axillary hairs to the veins. Flower-stalks almost as long as the leaves, being thrice the length of *T. alba*. We have seen no specimen of this species, but it has probably been introduced into the gardens by some of our collectors from America. It is extremely likely to be the Warhew of Mr. Abbot, in our Insects of Georgia, t. 11.; which from the above-mentioned error of the gardeners respecting *T. alba*, we supposed could be no other than that species, now known not to grow in America. The Warhew is said to be very like the European Lime-tree, except being always a low bush or shrub. Mr. Abbot's figure answers so well to Ventenat's and Pursh's definitions, as to leave scarcely a doubt on the subject, except only that the latter speaks of *T. heterophylla* as an ornamental tree. It may attain a greater size in one part of the country than in another.

We feel much regret in rejecting our late esteemed correspondent M. Ventenat's supposed improvements in the nomenclature of the species of *Tilia*. But besides their appearing to us uniformly for the worse, as usual in all such alterations that ever came in our way, we greatly prefer established names; which though occasionally erroneous or ambiguous, have generally acquired associations that compensate for any defects.

TILIA, in *Gardening*, contains plants of the ornamental tree kind, among which the species mostly cultivated are, the European lime-tree (*T. europæa*); the broad-leaved American lime-tree (*T. americana*); the pubescent Carolina lime-tree (*T. pubescens*); and the white lime-tree (*T. alba*).

The first sort, though little used, is a handsome tree, having a smooth taper straight trunk, and the branches forming a beautiful cone. The foliage also is smooth and elegant: it grows to a very large size, and affords good shade: it makes a fine detached object in parks and open lawns, planted singly: the branches are so tough as seldom to be broken by the winds, and the flowers have a delightful fragrance: the wood is soft, but capable of being turned into

light

light bowls and dishes, &c. There are several varieties of it, as the narrow-leaved, the broad-leaved, the elm-leaved, the red-twiggged, the smooth small-leaved, the smooth large-leaved, the soft hairy-leaved, the wrinkled-leaved, and the striped-leaved.

Culture.—These trees may be increased by seeds, layers, and cuttings. The seed, when ripe in the autumn, should be beaten down, keeping the green-twiggged and red-twiggged sorts separate; and be sown soon after, or preserved dry and sown till spring; sowing it in a bed or border of common earth; previously digging the ground, and dividing it into four-feet wide beds; drawing the earth off the surface evenly, about an inch deep, into the alleys; then sowing the seeds thinly, touching them lightly down into the earth with the back of the spade, directly earthing them over to the above depth.

When they come up in the spring, the beds should be kept clean from weeds, giving moderate waterings in dry weather, to forward the plants in growth as much as possible, in order to be fit for planting out in nursery-rows by the autumn or spring following; though, if they have shot rather weakly, they should stand another year, then be planted out in rows two feet and a half asunder, by eighteen inches distance in the lines, to remain three or four years or more to acquire a proper size for the purposes intended, trimming off the large side-branches from the lower part of the stem occasionally, to encourage their aspiring more expeditiously at top, which should be suffered to remain entire: these trees, when raised from seed, generally assume a more handsome and expeditious growth than such as are raised from layers and cuttings. When they are from about five or six to eight or ten feet high, they are of proper size for final planting out; though, when designed as forest-trees for timber, it is advisable to plant them finally while they are young, as not more than from three or four to five or six feet high.

They are all raised readily by the layer method; and for this purpose proper stools must be prepared, and the young shoots of a year or two old are the proper parts for being laid down, which should be performed in autumn or winter, by slit-laying, shortening the tops of each layer within a little of the ground: they are mostly rooted by the autumn following, and fit to plant out in nursery-rows, being then managed as the seedlings.

When cuttings are employed, the strong young shoots of the year should be chosen in autumn or spring, and planted in a moist good soil; or any scarce sorts may be planted several together in pots, and plunged in a hot-bed, as they more readily strike root in that way.

These two last methods are the proper ones for raising the varieties with certainty.

These trees are of a quick handsome growth, and succeed in almost any soil and exposure. They are some of them employed for their fine appearance, others for the exquisitely sweet smell of their flowers, and most of them for the use of their wood. The plants of them are also occasionally made use of in forming hedges in particular situations, but they are not by any means well calculated for this purpose.

As timber trees, their wood is found highly valuable on account of its softness, lightness, and toughness, for the making of various sorts of household utensils, as bowls, basons, &c. as well as for different purposes in the business of carving, gilding, turning, spinning, &c.

All these trees afford ornament and variety among other deciduous trees in the shrubbery, plantations, &c.

TILIACEÆ, in *Botany*, a natural order of plants, the seventy-ninth in Jussieu's system, or the nineteenth of his thir-

teenth class, of which *Tilia*, the Lime-tree, is an example. See GERANIA for the full characters of this thirteenth class. Those of the order in question are thus given.

Calyx either of many leaves, or in many deep segments. *Petals* definite, distinct, (wanting in *Sloanea*,) alternate with the segments or leaves of the calyx, and for the most part agreeing with them in number. *Stamens* generally indefinite in number, and distinct. *Germen* simple. *Style* frequently solitary, rarely either multiplied, or wanting. *Stigma* either simple or divided. *Fruit* in some instances pulpy, in others capsular, mostly with several cells, having one or many seeds in each, the partitions from the centre of each valve. *Corculum* of the seed flat, surrounded by a fleshy albumen. *Stem* arboreous or shrubby; rarely herbaceous. *Leaves* alternate, simple, accompanied by stipulas.

Section 1. *Stamens definite in number, more or less combined in their lower part, or at the very base.* These are termed by Jussieu "doubtful Tiliaceæ." They consist of *Waltheria*, *Hermannia*, and *Mabernia*.

SECT. 2. *Stamens distinct, mostly indefinite. Fruit of many cells. Genuine Tiliaceæ.*

Anticborus; *Corchorus*; *Helincarpus*; *Triumfetta*; *Sparmannia*; *Sloanea*; *Apeiba* of Aublet, which is *Aubletia* of Schreber; *Muntingia*; *Flacourtia* of L'Heritier; *Oncoba* of Forskall, Lamarek Illustr. t. 471; *Stuartia*; *Grewia*; and *Tilia*.

SECT. 3. *Stamens distinct, indefinite. Fruit of one cell. Genera allied to Tiliaceæ.*

Bixa; *Laetia*; and *Banara* of Aublet and Schreber.

The author hints that this order might possibly, with propriety, receive a reinforcement of several polypetalous polyandrous genera, at present not well understood, and therefore annexed to other orders, among subjects that remain in doubt. He names *Soramia* of Aublet (see MAPPIA); *Calinea* of the same (see DOLIOCARPUS); *Cleyera* of Thunberg (see TERNSTROEMIA); *Vallea* of Linnæus; *Dicera* of Forster (see ELÆOCARPUS); *Carapa*, *Maburea* (see BONNETIA), *Houmria* (see MYRODENDRUM), *Vantanea* (see LEMNISCIA), all of Aublet; and *Trilix* of Linnæus. The reader will be able to form his own opinion on these matters, by turning to these articles in their proper places, many of the genera and their affinities having become better known since the publication of Jussieu's work.

The characters of his *Tiliaceæ* are hardly to be distinguished from those of his next order *Cisti*, the principal difference consisting in the straight *corculum*, and more copious *albumen*, of the former.

TILLABARUM, in *Ancient Geography*, a town of Africa Propria, upon the route from Tacapæ to the Greater Leptis, between Thebelamum and Adaugmagdum. Anton. Itin.

TILLÆA, in *Botany*, was dedicated by Micheli (followed by Linnæus) to the honour of his friend and fellow-labourer Michael Angelo Tili, who published a splendid and rich catalogue of the garden of Pisa, of which he had the care, in 1723. He was a member of the Royal Society of London, as well as of the Botanical Society of Florence, and corresponded with the chief botanists of his time, in England, Holland, and elsewhere. He travelled to Constantinople and Tunis.—Linn. Gen. 68. Schreb. 93. Willd. Sp. Pl. v. 1. 720. Mart. Mill. Dict. v. 4. Ait. Hort. Kew. v. 1. 282. Sm. Fl. Brit. 201. Mich. Nov. Gen. 22. t. 20. Juss. 307. Lamarek Illustr. t. 90. Gært. t. 112.—Class and order, *Tetrandria Tetragynia*. Nat. Ord. *Succulentæ*, Linn. *Sempervivæ*, Juss.

Gen. Ch. *Cal.* Perianth inferior, in four deep, flat, ovate, large segments. *Cor.* Petals four, ovate, acute, flat, rather

rather smaller than the calyx. *Stam.* Filaments four, simple, shorter than the corolla; anthers small, roundish. *Pist.* Germens four; style simple; stigmas obtuse. *Peric.* Capsules four, oblong, pointed, reflexed, the length of the calyx, bursting longitudinally along the upper edge into two valves, with one cell. *Seeds* two, or many more, in each cell, ovate.

Obs. *T. muscosa* has the parts of fructification usually in threes, not fours. Gärtner discovered its flowers to be sometimes even five-cleft. He justly remarks, that such differences of number are in this natural order of little importance, and that *Tillæa* differs from *Crassula* in nothing but the want of nectariferous scales below the germens.

Ess. Ch. Calyx in three, four, or five segments. Petals as many. Nectaries none. Capsules three, four, or five, bursting inwards. Seeds several in each capsule.

1. *T. aquatica.* Water Swedish Tillæa. Linn. Sp. Pl. 186. Fl. Suec. 54. Willd. n. 1. Ehrh. Phytoph. n. 14. Schkuhr in Uft. Annal. fasc. 12. 6. t. 1.—Stem erect. Leaves linear, acute. Flowers nearly sessile.—Native of watery places in Lulea Lapland; as well as near Upsal, where water has stagnated, in hilly spots. Linnæus. A delicate, smooth, annual plant, two or three inches high, somewhat like *Montia fontana*, but much more slender, growing in dense tufts, simple or branched. Leaves opposite, stalked, narrow, acute, entire, a third of an inch long. Flowers either axillary and lateral, or in the forks of the stem, solitary, small, white, on very short stalks. The whole herb is succulent and pellucid.

2. *T. prostrata.* Prostrate German Tillæa. Schkuhr in Uft. Annal. fasc. 12. 6. Willd. n. 2. (*T. aquatica*; Schkuhr in Uft. Annal. fasc. 2. 21. t. 3.)—Stem prostrate. Leaves lanceolate. Flowers on short stalks.—Native of moist ground in Germany. Annual, differing from the foregoing in having many prostrate stems from one root, broader leaves, which are nearly cylindrical, and rather longer flower-stalks. Seeds eight in each capsule. Schkuhr.

3. *T. Vaillantii.* Stalked French Tillæa. Willd. n. 3. (*Sedum minimum annuum*, flore roseo tetrapetalo; Vaill. Paris. 182. t. 10. f. 2.)—Stem erect, much branched. Leaves ovate, clasping the stem, shorter than the flower-stalks.—Native of France. Observed by Vaillant, in the forest of Fontainebleau, where water has stagnated in winter, flowering from May to August. Root annual, of a few small tufted white fibres. Stem an inch or two high, repeatedly branched, scarcely forked, purplish. Leaves in pairs crossing each other, very thick, pointed, gibbous underneath, dark green, about two lines long. Petals four, rose-coloured, with a dark-coloured mid-rib. Seeds numerous, black, very minute.—The broader thicker leaves, and the much longer flower-stalks, render this very distinct, as Willdenow observes, from *T. aquatica*.

4. *T. peduncularis.* Long-stalked Brazil Tillæa.—Stem erect. Leaves lanceolate, acute. Flower-stalks often twice the length of the leaves. Capsules abrupt.—Gathered by Commerçon, in marshy spots that had been overflowed, at Monte Video. This grows in tufts, and has very much the habit of *T. aquatica*, for which possibly it may have been taken. There appears nevertheless much difference between them. The whole herb, in the present instance is red, and the flowers rose-coloured, growing on long stalks, which, though indeed variable, are never less than half the length of the leaves, and often twice their length. The shape of the leaves agrees with *aquatica*; but the capsules when expanded are more abrupt, and even inversely heart-shaped.

5. *T. muscosa.* Mossy Tillæa. Linn. Sp. Pl. 186. Willd. n. 8. Fl. Brit. n. 1. Engl. Bot. t. 116. Rose's

Elem. append. 448. t. 2. f. 2. (*T. muscosa annua perfoliata*, flore albo; Mich. Gen. 22. t. 20. *Sempervivum omnium minimum repens muscosum*, polygoni facie; Bocc. Mus. 36. t. 22. *Polygonum muscosum minimum*; Bocc. Sic. 56. t. 29.)

β. *Crassula muscosa*; Linn. Sp. Pl. 405. Am. Acad. v. 6. 86. Willd. Sp. Pl. v. 1. 1557. Thunb. Prodr. 54. See CRASSULA, n. 40. (*Ficoides africana annua minima muscosa*; Herm. Parad. 170.)

Stems procumbent, branched. Leaves obtuse. Flowers mostly three-cleft. Calyx and petals taper-pointed.—Native of sandy barren ground in the more temperate parts of Europe, flowering in summer. Abundant on sandy heaths near Norwich, Bury, Brandon, &c. The variety β is brought from Africa, from Lima, and even from New South Wales. We can find no difference in the dried specimens, except their being larger than our's, with somewhat of a glaucous hue, and the flowers partly stalked, more numerous, and all, as far as can be examined, five-cleft and pentandrous, just like Gärtner's plate of *T. muscosa*. The British specimens of the *muscosa* are from one to two inches high, strongly tinged with a blood-red, ascending, branched, with a fibrous annual root. Leaves elliptical, thick, obtuse, somewhat channelled above; clasping their stem at their base. Flowers mostly three-cleft, sessile; their petals white, with a taper red point, less than the calyx. Seeds only two in each capsule.

We scruple to retain in this genus four other species admitted by Willdenow. The first is *T. capensis*, Linn. Suppl. 129. Willd. n. 4; evidently, as Thunberg calls it, a *Crassula*, by its purple triangular nectaries, though, on account of its four-cleft flowers, made a *Tillæa* by Linnæus and Willdenow.

T. perfoliata, Linn. Suppl. 129. Willd. n. 5; *T. umbellata*, Willd. n. 6; and *T. decumbens*, Willd. n. 7; all referred to *Crassula* by Thunberg, have none of them fallen under our inspection; but as Willdenow avows having been guided by number, we have no scruple in removing them hence.

So also *Crassula moschata*, Forst. Magell. 16; gathered by that author, as well as by Commerçon, Menzies, Banks, and Solander, at Staten land, is most certainly a *Crassula*, because of its nectaries; though, on account of its four-cleft flowers, it has been taken by some great botanists for a *Tillæa*.

TILLAGE, in Agriculture, the practice of tilling or cultivating land, especially of the arable kind, or the means of bringing it into a state of preparation for the growth of different sorts of arable crops.

Of all the arts, says Vattel, tillage, or agriculture, is the most useful and necessary. It is the nursing-father of the state. It forms the surest resource and the most solid funds of riches and commerce, for people who enjoy a happy climate. This object, therefore, deserves the utmost attention of government: and it ought carefully to avoid every thing capable of discouraging the husbandman, or of diverting him from the labours of agriculture. Those taxes, those excessive and ill-proportioned impositions, the burthen of which falls almost entirely on the cultivators; and the vexations they suffer from the commissioners who levy them, take from the unhappy peasant the means of cultivating the earth, and depopulate the country. Spain is the most fertile and the worst cultivated country in Europe. The church possesses too much land, and the undertakers of the royal magazines, who are authorized to purchase, at a low price, all the corn they find in the possession of a peasant, above what is necessary for the subsistence of himself and

TILLAGE.

his family, so greatly discourage the husbandman, that he sows no more corn than is necessary for the support of his own household. Whence frequently arises the greatest scarcity in a country capable of feeding its neighbours.

Another abuse injurious to agriculture is, the contempt cast upon the husbandman. The inhabitants of cities, even the most servile artists, and the most lazy citizens, consider him that cultivates the earth with a disdainful eye; they humble and discourage him. They dare to despise a profession that feeds the human race; the natural employment of man. A little insignificant mechanic places far beneath him the beloved employment of the first consuls and dictators of Rome. China has wisely prevented this abuse; agriculture is there held in honour, and to preserve this happy manner of thinking, every year, on a solemn day, the emperor himself, followed by his whole court, sets his hand to the plough, and sows a small piece of land. Hence China is the best cultivated country in the world: it nourishes an innumerable multitude of people, that at first appears to the traveller too great for the space they possess. Besides, the cultivation of the soil is an obligation imposed by nature on mankind.

The most proper sorts of soils for the purposes of tillage-cultivation, are all those of the more dry and friable kinds, whether the depth of earth or mould, or what is often termed staple in them, be only slight or considerable; as under different circumstances these differences fit them for the production of different sorts of crops, the methods of cultivation in which are fully explained under their different proper heads.

In this view, all the various denominations of light soils, such, for instance, as gravels, sands, light chalks, and thin loamy lands, are well adapted, in most cases, to the purposes of tillage, from their being, in general, pretty well suited to the various sorts of grain, as well as to the raising of such green and root-crops as are necessary in the support and management of different kinds of live-stock. The more deep, loamy, chalky, and gravelly sorts of land, where they can be kept sufficiently dry, and in a proper state, during the winter season, may likewise, in many cases, be well employed in tillage-cultivation, and especially when they do not produce and afford an abundant and useful sort of herbage for the keeping of animals, or other uses. All the lands of the sward-kind, or in the state of grass, which are liable to be infested with the moss-plant, or to become over-run with a mossy covering, may, in common too, be managed under the tillage-system with much advantage, and better than in such a state of grass.

In some cases, lands may be suited to convertible tillage, or alternately that of grain and grass, with vast benefit to the farmer. It has been remarked on this sort of tillage by a late writer, that land may in this way often be turned to better account by ploughing and tilling it eight or ten years, and then laying it down to grass, in order to take up another part or portion, than by the common method, but especially where the land is subject to ant-hills; as the paring and burning destroys all such hills, and such land is sure to bring abundant crops of corn. And that there are very few situations that have dry land and soil fit for the plough, but what would bring more profit under tillage than by lying in the state of old grass; for when such good land as this is well laid down to grass, with plenty of good proper seeds, after a course of tillage, an acre of it will keep as much stock as four acres would which were produced in the natural way, and this is what makes its great value. Such tillage-land as this, it is said, is worth more money than the finest grass-land in the kingdom; as,

on the fine marshes so much boasted of, the earliest of the summer-stock comes to market at the very time when all sorts of vegetables are in plenty, such as peas, beans, and many others, and when meat consequently is sure to fall in price; and great numbers of grass-fed beasts, or cattle and sheep, come together. Besides, the very best grass-lands send only two sheep in the two early months of April and May from an acre; but the best tillage-land will send ten from an acre, and have them ready any time in the winter, when meat is the dearest. Thus, it is contended that ten acres of turnips will send one hundred sheep in the dearest time to the market, but that it will take fifty acres of the best land in grass, to send the same number to the market.

It is therefore concluded that, in this way, the tillage-farmer sends three hundred acres of corn to market, and as many fat sheep besides, acre for acre, as the best grazing-land; and that by still other improved methods of management, as that of the culture of flax for the use of the seed in fattening live-stock, and some others of a similar description, the tillage-farmer may derive greater profit than by the turnip practice, from the large quantity of winter-fattened animals, and the vast supply of dung or manure which is thus raised and provided.

Although the necessity of good tillage in the preparation of land for cropping be now pretty well understood by the practical farmer, and has been inculcated occasionally under different heads in the present work, it requires to be well explained in some of its processes. It has indeed been observed in the Agricultural Survey of the County of Hereford, after noticing that the Romans were convinced of the good effects of this sort of preparation, as Pliny has remarked the advantages of frequent ploughing and turning over the soil in Tuscany; and that, in this country, Evelyn suggested its power of so altering a soil from its former nature, as to render the hardest and hardest as well as most uncivil clay obsequious to the husbandman; that tillage also destroys weeds, and reduces the earth to small particles, rendering it sufficiently loose and porous to admit of the easy growth and extension of the roots and fibres of the grain to be cultivated in or upon it. And that the spade is well adapted to these purposes, because it moves the ground eight or ten inches deep, turns it upside down, and covers the weeds with a quantity of earth, under which they rot, and contribute towards its fertilization and improvement; and that this mode is founded on the just idea or notion of the Flemings, that a farm should resemble a garden as nearly as possible. But that as the spade method is much too tedious and laborious, as well as too expensive, to be practised on the larger scale of a farm, the plough is therefore substituted, as cheaper and more expeditious, but that, in general, it does not stir the earth so deeply, and often moves it in large bodies or masses, without sufficiently breaking it into pieces. In order to remedy this inconvenience, the celebrated Mr. Tull, it is said, recommended a plough of his own invention, which had four coulters instead of one, and thus divided the earth raised by the shares into several narrow slips; but the resistance occasioned by the additional coulters was found to require a greater strength in horses than the profits of the experiment and work would warrant. It was, however, afterwards ascertained by a distinguished foreigner, M. de Chateaubieux, that the breadth of the furrow should be proportioned to the stiffness of the soil or land; and that thus the resistance may be regulated on all kinds of land or soil. But the operation of repeated cross-ploughing, and the use of other tools, as now generally practised, aided as they are by full exposure

TILLAGE.

exposure to frost, rain, &c. so effectually break down the hardest soils, that other measures are, it is thought, rendered less necessary. Since the above was written, however, many useful instruments have been formed, by which tillage-cultivation is not only rendered more effective, but more easy and expeditious, as may be seen by the descriptions which have been given of them under their different proper heads. See DRAG, SCARIFIER, SCUFFLER, SPIKE-ROLLER, &c.

M. Duhamel has since too observed in his "Elements of Agriculture," that some believe it is more advantageous to increase the fertility of land by frequent ploughing and other means than by manure; because, in general, only a certain quantity of manure can be procured; as twenty acres of land will, in common cases, scarcely produce as much manure as is necessary for five; whereas the particles of the earth may be divided and subdivided almost to infinity. The aids, therefore, which are derived from manure, must, it is supposed, be limited, whilst no bounds can be set to the benefits that may accrue from ploughing or breaking down and reducing the parts of the soil. This appears, the writer thinks, to be over-rating the advantages of breaking the soil down in other ways; but, it is certain, that when the particles of land or soil adhere so closely together as to impede the extension of the roots of plants, in search of the food and nourishment they require, the plants themselves cannot grow with proper vigour, or yield a proper produce. This is therefore to be corrected by frequent ploughings, &c. And that, lastly, repeated ploughings and other such means enable the land to receive and retain all the benefits to be derived from the floating vapours and dews of the atmosphere, which falling on hard ground, where it cannot readily penetrate, is quickly exhaled by the next day's sun and wind.

Notwithstanding these remarks, it may, however, be noticed, that no tillage or breaking down of the parts of the soil, though ever so complete and effectual, can wholly supply the place of manure, although it may greatly contribute, in different instances, to assist its fertility.

These are some of the more general and particular ways in which tillage becomes so essential and effectual in promoting the fertility and improvement of land; but there are a few others, the processes of which may be seen under their proper heads.

In the tillage-cultivation for most sorts of crops of the grain or corn kinds, as well as some others, it becomes essentially necessary that the soil should be reduced to a very considerable degree of fineness, or what is frequently termed *tilth* by writers on husbandry; as, where this is not the case, they can neither be so well provided with food or nourishment, nor be kept so perfectly and so sufficiently clean and free from weedy matters. There are other reasons too that require, at least, the more superficial parts of the soils to be in a fine condition of tillage for the receiving of such crops, which are those of the young tender roots of the new rising plants being thereby rendered more capable of fixing themselves perfectly in the mould which is produced, and of their drawing from it a more regular supply of food, in consequence of the more equal diffusion of moisture and other substances through it, which must necessarily take place. Besides, it is favourable in other ways, as by such tillage the seed-corn is not only more capable of being perfectly but equally covered, in consequence of which the vegetation and growth of the young plants of it are more equal and expeditious.

But besides the state and condition of the soil or land in regard to tilth, it should be in a suitable situation in respect

to dryness; as where there is too great a degree of moisture in it, the tillage can neither be performed in a proper manner, nor the seed-corn be put in without the danger of sustaining injury by becoming rotten before the vegetative process takes place, as not unfrequently happens to pea and other garden crops, when put into the soil during the moist winter months: and where, on the contrary, the land is in too dry a state, the tillage is improper to be effected, as causing too much exhalation, by which the seed-corn, when put in at such periods, may be much injured by the want of that moisture which is necessary for perfect vegetation. Under the last circumstance too, it may be more liable to be destroyed by worms, grubs, and other insects. On these accounts the arable farmer should, of course, be equally attentive to the tillage preparation of the soil, and the condition in which it may be cropped to the greatest advantage, and with the greatest chance of success.

The writer of the "Elements of Agricultural Chemistry" states, that in all cases of tillage, the seeds should be put in so as to be fully exposed to the influence of the air. And that one cause of the unproductiveness of cold clayey adhesive soils is, that the seed becomes coated with matter impermeable to air. All immediate tillage, for putting in crops, should consequently be performed as much as possible in suitably dry weather on such sorts of land.

In sandy soils, he says, the earth is always sufficiently penetrable by the atmosphere; but in clayey soils there can scarcely be too great a mechanical division of the parts in the process of tillage.

In general, the best and most effectual method of breaking down and bringing land into the state of proper tillage, is by the use of the plough and different other implements of the harrow kind, such as those which have been noticed above, suited to the intention of the cultivator, and the peculiar nature of the land or soil. The tillage with the plough should constantly be performed according to the nature of the soil, and that of the crop which is to be sown or set, and the operations which are afterwards to be executed upon it. But to whatever depth this may be proper to be done, it is of much consequence to have it performed in an exact and effectual manner; as on this not unfrequently depends the difference between a good and bad crop, as well as that between the animals employed in the labour moving with ease and with difficulty. The repetitions in the tillage of this sort must be constantly regulated by the quality and circumstances of the land and the designs of the farmer, as some sorts and cases of land require much more tillage than others. This point is most decidedly evinced in the Agricultural Survey of the County of Gloucester. On the Cotswolds, it is the practice, the writer remarks, to sow their crops on one ploughing, experience having proved that frequent ploughings or tillage on these light soils, weaken the staple of the land, and are productive of injury.

On the strong lands or soils of the county of Essex, the most intelligent and successful practical farmers, it is said, are those who are the most careful in the repetition of tillage of the plough kind, to which they constantly attribute great powers and effects. The strong heavy lands have it eight or more times in many cases, even for barley or oats; and on those which are less so, the general system of tillage is mostly four or five times for the different fallow crops. In this last intention, it is not unusual to commence the first tillage ploughing towards November, continuing it nearly or quite to the end of March, after barley sowing; and if at the first period of such tillage the ridges be laid a little round, so as to be water-shot, and after that well water-furrowed, the tillage is greatly promoted. The land is mostly

TILLAGE.

first broken up into ridges of eight or twelve nine-inch furrows; then crossed, and the tillage given in different ways very often during the summer season, carefully turning up and exposing every time a different surface, as much as possible, to the sun and air: before harvest it is got up on four-furrow ridges, when, after that season is over, it has again immediately another tillage ploughing; and if the weather be suitable, it is done twice, leaving it upon the ridge for the ensuing winter: the later the last tillage furrow is given the better, in this district, for preventing the black grass-weed getting up; after which the whole is well water-furrowed for taking off any water that may be upon it: by these means the land is much earlier got upon in the spring season than could otherwise be done, and in consequence, when the tillage for barley is performed, such stiff tenacious lands break down into the finest tilth it is almost possible to conceive.

In executing the work of tillage on ridges for wheat, or any other sort of crop, great attention is here bestowed on turning the furrows well, drawing them straight, making them alike in size, and lapping them with such regularity on to each other, that the harrow tools cannot fail to lay hold of them all with facility; the flutting-up furrow more especially is drawn with perfect straightness, exactly turned, swept out with cleanness, and at the same time the space between the ridges not left in too wide a state.

But notwithstanding this great and frequent tillage, in some places they do not venture in the seed on the autumnal furrow, but give a spring plough tillage, though perhaps some other tool of the tillage kind might answer better in many cases, and be far more expeditious.

The most proper and suitable depths of tillage for different sorts of soils, have probably not yet been well ascertained; but such as have a good strong staple, require much more deep tillage than those of the light kind. Whether flat-work tillage, as practised in Norfolk, or that of feather-edged, as employed in Essex, has the advantage, is not properly decided, but probably each may have a superiority on different sorts of land: the great point of importance is that of allowing the covering of the seed well.

The plan of tillage given below has been advised in the Corrected Agricultural Survey of the County of Salop, for the lighter sorts of friable lands, on a farm of four hundred acres: first, the wheat stubble is to be harrowed by drawing the harrows one way, which lays the stubble; and by returning back along the same stroke, they draw the greater part of that which was gathered by the harrows; and a proper person following them with a fork, unloads them, and lays the stubble in heaps, to be disposed of as directed below.

This stubble ground has the tillage of ploughing from the middle of November to the end of the following month; about the beginning of March it has that of cross-ploughing given it, and when dry, well harrowed; and when the weather is suitable, much of the couch-grass is got out of it and burnt; but when not so, it is, in this way, checked in its growth during the seed-time, and the business is more easily performed; which is to be done in the month of May and the two succeeding ones, in which the fallow lands have the tillage of three ploughings and sufficient harrowings to prepare them for turnips, for which eight cubic yards of reduced dung, or seventy-two bushels of clod-lime, are laid upon the acre; which are ploughed in at the last tillage-furrow, though sooner, it is thought, would be better, if the dung be reduced enough by that time, or the land be so clean as not to require much harrowing. Turnip-feed, one pound to the acre, is then sown from the 7th of June to the

14th of the following month, the plant being twice hoed; the average produce is from 2*l.* to 2*l.* 1*s.*

As the same land becomes cleared of its crop of turnips, it has the tillage of ploughing and harrowing, preparatively for a crop of barley: and being again tilled, by being ploughed up in butts or lands five yards in width, from the latter end of March to the latter end of the following month, is sowed with three and a half statute bushels of barley, fourteen pounds of common red clover-feed, and one peck of fine rye-grass-feed to each acre: the average produce is about forty bushels, of the statute kind, of barley to the acre.

The young clover which is not eaten between December and May, in the part which is mowed, on an average produces about two waggon-loads, or a ton and a half to the acre. In the succeeding month of October, it is ploughed in the tillage of nine-inch furrows and six inches deep, and sowed with two and a half bushels of wheat: the produce about seventeen bushels the acre.

The turnip-crop is generally disposed of somewhat in this manner: first, by drawing home those under the hedges, at the beginning of November, and some of the largest over the rest of the field, taking all up where the horses and carts are to pass. When the tops and small roots are cut off, they carry them home, and place them in heaps of about twelve cart-loads each, in the form of the cone of a wheat-rick, covering them a foot thick with straw and thatch. These serve as a resource in time of frost and snow, for the beasts that are stall-fed, of which there are generally twenty yearly; and a man and boy, with one horse and cart, supply them; leaving ultimately in the fields as many turnips to be eaten off upon the land by sheep, as to ensure fertility enough for the crops of barley, &c. as the barley, being too rank, commonly spoils the young clover growing with it. Another advantage in this plan of tillage, which is obtained by stall-feeding with turnips, is the making a large quantity of straw into manure at home; which is the best use that can be made of it, as straw-food is not an improver of cattle-stock.

This method of tillage or cultivation for dry lands, is recommended to those who have been in the practice or custom of long tillages, and without the use of general turniping, to be continued for so long as two courses of tillage, that is, eight years; by which time their land will be clean, and more fit for what is conceived to be a more beneficial mode of husbandry, and which mode is now, it is said, pursued; namely, first turnips, managed and manured for as above; second, barley; third, pease, in rows one foot asunder, hand-hoed and weeded; fourth, barley, with ten pounds of common clover, four pounds of white Dutch clover-feed, two pounds of trefoil-feed, and one peck of fine rye-grass-feed, eight cubic yards of rotten dung, or seventy-two bushels of stone-lime laid upon the young clover in November; fifth year, mow or graze the land; the sixth, graze until October; and the seventh, give a plough tillage, and sow with wheat as before; the land mucked for turnips, and lime or compost of lime, and earth or mud, &c. laid on the young clover in the autumn. This is believed to be a more profitable course of tillage, after land has been got into order, than that which was previously practised, affording a greater change, and thereby obviating the failure both of turnips and clover, and occasioning more grass-land, which for many years has there exceeded the tillage in point of profit.

As an improvement of wheat-lands, or mixed soils upon clay, the mode of tillage directed below is advised to be practised.

TILLAGE.

The turf or other land being well ploughed or tilled, and laid dry before Christmas, in the following month of April sow the land with four and a half statute bushels of oats, plough and lay it dry in the autumn, and in the month of May and the two following ones, give it three good tillage ploughings and harrowings, with some rollings, &c. so as to reduce it well; being thus drawn up and laid dry, it may continue in that state to the middle of September; though made both fine and clean, it sometimes gets an adhesive and binding quality, and consequently works lumpy, and therefore has the texture and quality which the farmer, by mistake, is afraid of losing by making his land clean. It is, however, it is said, in the three above months, when the sun is powerful, that land is to be cleaned by tillage: a ploughing in August is seldom of much worth.

If manured with lime, lay eighty bushels upon the acre; if with dung, ten cubical yards to each acre, either ploughed under at the July tillage ploughing, or before. From the 20th of September to the 10th of the succeeding month, sow wheat nine statute pecks to the acre, after having soaked the same not more than eight hours in mild brine, and dried it with lime, to prevent the smut. The next autumn plough the corn stubble, and at the end of March plant beans or peas in rows one foot asunder, hand-hoe and weed them. Plough in the autumn, and sow oats in the spring, and lay down with ten pounds of red clover-feed, four pounds of white Dutch clover-feed, and one peck of rye-grass-feed to each acre. Manure the land in feeds in the autumn, and let it lie in sward two or three years, as it may be required. At the next breaking up, plant the land with beans, hand-hoe and weed them; the ensuing autumn sow it with wheat, then with beans in rows, hand-hoe and weed that crop; then put in oats and lay down with feeds, as before. In lieu of one of the hoeing crops, if the land be not too wet, potatoes may be planted, which would be found very profitable to the wheat-land farmer; being very useful food for feeding or milking cows in the winter season. The farmer should fallow for the first crop in one tillage, and hoe the next, and so proceed alternately; the summer sun to wheat-lands being certainly useful, and also the manuring with dung or lime in an alternate manner. Where marle is to be procured at convenient distances, nothing turns to more profit; upon open soils, with either clay or dry bottoms, marle laid upon the sward in the autumn, and to lie one year, is commonly the best practice, especially if the marle be not perfectly good. Lime is sure to pay well the next tillage course.

On this mode of tillage it is, however, remarked, that good farmers, on light soils, will entertain the plan here prescribed with some caution, and that their apprehensions of a crop of couch will often outweigh their hopes of a crop of clover. That peas are precarious; one week's hot weather whilst in blow is often fatal to the crop.

It is added too, on the authority of Mr. Harries, after noticing the insufficiency of some fallow tillage lands, that there are many active farmers who begin the tillage on their fallows in January, and by repeated ploughings, harrowings, and rollings, bring them into very good order for wheat. Others graze the second year's clover until about the middle of the summer, and sometimes mow it at that time: if the soil be dry and the summer favourable, they bring it into very good tillage order by feed-time. It would, however, it is thought, be better tillage husbandry to raise a crop of turnips on such lands, after wheat or barley. If this was done, at least in every course of tillage, a good crop of wheat would be grown upon clover lays, upon one tillage ploughing, at a light expence. It is frequently his custom to break

up his clover lays of the first or second year, if they are tolerably clean, upon one ploughing, putting upon the plough a cutting tool or instrument, which is there termed a *say* or *slay*, that cuts or pares off the surface turf, and lays it in the bottom of the furrow. Lately, a clover lay was worked with this instrument upon the plough, and after the feed was harrowed in, scarcely any of the surface turfy matter came upon the ploughed surface, the field looking as well, and appearing as clean, as though it had been sown upon fallow tillage.

Some, however, on hollow lands, do not approve of this skimming or paring tillage; as slicing the surface of such soils they consider much worse than turning it over in the ordinary manner, and letting the surface vegetable matters be laid into the furrows in a sort of diagonal position, though some of them should even appear out in the seams. The notion is notwithstanding probably erroneous, as such surface produce is always, in some way or other, to be rotted and got rid of, as in every mode of tillage it is ploughed in or under, and the main point is how to get the most speedily and completely quit of it, and to render it the most useful to the crop which is to be put in. These are certainly the best and most fully accomplished by taking it wholly off by such a cutting apparatus, and placing it at the bottoms of the furrows, which must also lessen the hollowness of the land at the same time.

In the breaking-up tillage of old grass-lands, it must be executed in a manner suitable to the nature, state, and quality of the soil, whatever that may be, reducing and breaking the turfy sward well and carefully down, and clearing it effectually from insects and vermin of all sorts by proper crops, such as those of the pea, bean, teasel, and other similar kinds, before the introduction of those of the grain sort. In this way, the lands will not only be the best wrought into a proper state of tillage, but the corn-crops the most effectually secured from the danger of worms, grubs, and other noxious vermin.

It has been remarked by the writer of the Corrected Agricultural Survey of the County of Norfolk, that for the last four or five-and-thirty years that he has examined West Norfolk with the eye of a farmer, the change in the tillage system, which has taken place in that vast arable district, has not been great. At the early part of that period, the tillage course was, it is said, first, turnips; second, barley; third, grasses for two, or, in a few cases, three years; fourth, white corn: on the better soils, wheat; on others rye, &c. The only material change that has occurred, has been, it is thought, in the grasses: the variation, which, it is believed, first took place from forty to fifty years ago, was shortening the duration from three years to two; in both cases giving what may be called a sort of bastard fallow the last year, by means of a half-ploughing, soon after the middle of the summer. Above thirty years ago, the writer, it is said, contended, both in print and in conversation, against it, but was held cheap for entertaining any doubts of the propriety of the practice. He has lived, however, it is observed, to see this change also in a great measure take place amongst the best farmers, who now give only one ploughing for the winter corn, whether wheat or tares; or in the spring for peas. That it is an improvement cannot be questioned, it is thought. The argument for it, founded on the invention of the drill-roller, and on the introduction of the drill-plough, is good, it is said, but not singular, as the practice of dibbling is likewise far more adapted to a whole than to a broken furrow; and for broad-cast common sowing, if we are able to cover the seed by harrowing on stiff soils, once ploughed, assuredly the same practice might be better followed on sand. The other

rather reason for the former system, spear-grass getting a head in a layer, is quite inadmissible, it is thought; as he must entirely agree with Mr. Overman, a large tillage cultivator in that district, that no weeds, the seeds of which are not carried by the wind, will be found in a layer, if they were not left there.

It is contended likewise, that the variations which have taken place in the tillage crops put in upon layers, are neither great, nor are they peculiar to the above county; the principal one is that of taking pease on the flag, and then the wheat, and others, an admirable system, which, it is said, has long been practised by good farmers in Suffolk, and, it is believed, still earlier in Kent. That Mr. Purdis's mode of substituting tares holds on the same principle. Considering the very great use and value of white pea-straw, well got, as sheep food, which is no where better understood than in Kent, it is thought there is no tillage husbandry better adapted to a sheep-farm, than this of pease or tares preceding the wheat crop.

But it is thought that a very great and important change has taken place in the application of tillage crops to sheep instead of bullocks and cows. Formerly the farmers consumed much of their straw by cattle; now the best of them have it all trod into manure. Sheep are the main grazing stock, and no more cattle kept than for treading, not eating straw while feeding on oil-cake and other such food. This is, it is contended, a very important change, which has had considerable effect, and which has depended not a little on the introduction of South Down sheep. Yet still, it is conceived, that the grand object in the whole tillage system, is the singular steadiness with which the farmers of West Norfolk have adhered to the well-grounded antipathy to the taking of two crops of white corn in succession: this is talked of elsewhere, it is said, but no where so steadily adhered to as in this district. It is this maxim, it is said, which has preserved the effect of their marle on thin-skinned lands of the wheat kind in such a manner, that the district continues highly productive, under an almost regularly increasing rent for more than sixty years, or three leases of twenty-one years each; and by means of which great tracts have been marled a second, and even a third time with much advantage. This tillage system, it is supposed, has been that to which the title of Norfolk husbandry has been long, and is now peculiarly appropriated; and by no means that of the management of the very rich district of East Norfolk, where the soil is naturally among the finest in the kingdom, and consequently where the merit of the farmer must be of an inferior stamp; barley there, it is said, very generally follows wheat; an incorrect tillage husbandry, deserving no praise, but condemnation. The celebrity of the county in general was not heard of, it is said, until the vast improvements of heaths, wastes, sheep-walks, and warrens, by enclosure, and marling took place in consequence of the exertions of Mr. Allen, of Lyng-House, lord Townshend, and Mr. Morley, who were in the first thirty years of the preceding century. They were happily, it is said, imitated by many others; an excellent system of tillage management introduced, and such improvements wrought, that estates and lands which were heretofore too insignificant to be known, became objects of public attention in the capital. The fame of Norfolk, it is remarked, gradually expanded, and the husbandry of the county was celebrated before East Norfolk was heard of beyond the conversation of Norwich and Yarmouth. It is, however, asserted, that without a continuance of cautious tillage management and persevering exertions, West Norfolk would even again become the residence of poverty and rabbits. But let the meadows be improved;

irrigation be practised wherever it is applicable; the remaining wastes cultivated; and this district will, it is maintained, become a garden. Such are the utility and importance of good tillage and other systems in the cultivation and improvement of land.

In concluding, it may be stated from the Corrected Agricultural Report of the County of Hereford, that the importance of the tillage farmer cannot be disputed; and yet that perhaps no branch of the art of husbandry is clogged with so many obstacles and impediments to its improvement and success. The advantages of the grazing system over that of tillage-cultivation, hold out a great inducement to the farmer to convert his tillage land into pasture, the immediate effect of which must be felt in the reduced quantity and increased price of grain of every description. And unfortunately, this is not the only obstacle or hindrance to the tillage farmer; the tax on horses used in agriculture operates also against the proper tillage culture of the ground. It was probably supposed, it is said, by the framers of this duty, that the number of horses would thus be diminished, and that of oxen increased; but it should be recollected that oxen, valuable as they sometimes are as *auxiliaries*, can never be made the *substitute* of horses for tillage; their constitution and habits will not admit of it; and the shoe with which they are occasionally furnished, affords but an imperfect protection to the foot on hard lands or stony roads. See TEAM.

No check, but every encouragement, should certainly be given to tillage, or the means of raising and providing the bread-corn for the increasing population of the country. See SUPPLY and Consumption.

TILLAGE Farm, that sort of farm which is, for the most part, cultivated under the arable or tillage system, or that by means of the plough. See FARM.

TILLANDSIA, in Botany, was so named by Linnæus, in memory of an early Swedish botanist, Dr. Elias Tillands, professor of physic at Abo, who died in 1692, aged 52, after having published in 1683 an octavo alphabetical catalogue, in Latin and Swedish, of the wild, as well as cultivated, plants of the neighbourhood of his residence. This little volume was accompanied, or soon followed, by another, consisting of rude, but often expressive, wooden cuts, of 158 plants, mentioned in the foregoing catalogue. It is a defect in these cuts that they are not always original; an instance of which occurred to the writer of the present article, while preparing a critical dissertation on some British species of *Hieracium*, see Tr. of Linn. Soc. v. 9. 232. The *Pilosella*, t. 14. of Tillands proving a copy of Tabernæmontanus, rendered his work of no authority in an important point; though such a defect was not previously known, even to his learned countryman the late Mr. Dryander; and the book sunk immediately in his estimation, except as a rarity.—A curious reason for the name of *Tillandsia*, as applied to the genus of which we are about to speak, is given by Linnæus himself, in his *Prælectiones in Ordines Naturales Plantarum*, published by Giseke, p. 291. “*Tillandsia* cannot bear water, and therefore I have given this name to the genus, from a professor at Abo, who in his youth having an unpropitious passage from Stockholm to that place, no sooner set his foot on shore, than he vowed never again to venture himself upon the sea. He changed his original name to Tillands, which means *on*, or *by*, *land*; and when he had subsequently occasion to return to Sweden, he preferred a circuitous journey of 200 Swedish miles through Lapland, to avoid going eight miles by sea.” This circumstance is also alluded to in the Tour in Lapland, published from the journal of Linnæus in 1811, v. 1. 43. One of the most invidious censurers

TILLANDSIA.

ceptors of this great botanist has declared that he would "excuse a thousand of his faults for the sake of the above name alone."—Linn. Gen. 158. Schreb. 212. Willd. Sp. Pl. v. 2. 11. Mart. Mill. Dict. v. 4. Ait. Hort. Kew. v. 2. 202. Pursh 217. Juss. 50. Lamarck Dict. v. 1. 616. v. 7. 666. Illustr. t. 224. (Caraguata; Plum. Gen. 10. t. 33. Renalmia; *ibid.* 37. t. 38.)—Class and order, *Hexandria Monogynia*. Nat. Ord. *Coronaria*, Linn. *Bromelia*, Juss.

Gen. Ch. *Cal.* Perianth inferior, of one leaf, oblong, erect, permanent, in three oblong-lanceolate, pointed segments. *Cor.* of one petal, tubular; tube long, inflated; limb small, erect, in three obtuse segments. *Stam.* Filaments six, linear, inserted into the tube of the corolla, and of the same length; anthers acute, incumbent, in the throat of the tube. *Pist.* Germen superior, oblong, tapering at each end; style thread-shaped, the length of the filaments; stigma three-cleft, obtuse. *Peric.* Capsule elongated, bluntly triangular, pointed, scarcely separated into more than one cell, of three valves. *Seeds* several, cylindrical, each supported on a long stalk of aggregate fibres, becoming a feathery wing.

Ess. Ch. Calyx inferior, three-cleft, permanent. Corolla tubular, three-cleft. Capsule with three valves. Seeds on a feathery wing.

1. *T. utriculata*. Bottle Tillandsia. Linn. Sp. Pl. 409. Willd. n. 1. Ait. n. 1. (*Viscum caryophylloides maximum*, flore tripetalo pallidè luteo, femine filamentoso; Sloane Jam. v. 1. 188.)—Leaves linear, channelled, recurved; dilated and inflated at the base. Stem closely panicle.—Found on the branches of large trees in Jamaica, where it is known by the name of Wild Pine. Sloane observes that the long, tough, smooth fibres of the *root*, which is perennial, do not insinuate themselves into the bark or wood, to draw nourishment from thence, but merely grasp the branch, fixing themselves firmly to the bark for support. *Stem* solitary, round, smooth, leafy, three or four feet high. *Leaves* numerous, often a yard long, channelled, entire, tapering to a very slender point, recurved, striated; paler beneath, and clothed with extremely minute chaffy scales like powder; the radical ones greatly enlarged and tumid at the base, where they form a sort of oval hollow vessel, which holds a quantity of water, collected during the wet season, from the rain trickling down the channels of the leaves. In this it is said that small aquatic animals sometimes take refuge, while birds, and even men, are reported to have hence derived a welcome supply of drink. The water seems destined to support the plant during drought, when it could otherwise obtain nothing by its roots; but this slender stock is enough to preserve life, and indeed a considerable degree of luxuriance. The *flowers* are of a pale greenish-yellow, with purple *anthers*, and compose a close branched panicle. The long branching down which accompanies each *seed*, and is inserted into its base, carries it to a distance, and readily clings to the rough barks of trees, where the *seed* speedily vegetates. When the *stem* is wounded, a clear white mucilaginous gum exudes. *Sloane*.

2. *T. ferrata*. Serrated Tillandsia. Linn. Sp. Pl. 409. Willd. n. 2. Ait. n. 2. (Caraguata clavata et spicata, foliis ferratis; Plum. Ic. 63. t. 75. f. 1.)—Leaves flat, smooth, with strong spinous ferratures; entire towards the base. Spike compound. Bractees with spinous teeth.—Native of Jamaica. Brought to Kew, with the foregoing, by captain Bligh, in 1793. This is a large stout perennial plant, with the aspect of an *Aloe*, but not so succulent. The *leaves* are two or three feet long, and two inches broad, their upper part especially bordered with hooked spines;

their under side curiously and minutely dotted between the numerous fine ribs. *Stem* and *compound spike* beset with broad, ovate, pointed *bractees*, whose spines are more direct and tooth-like; the under side ribbed and dotted in the manner of the leaves.

3. *T. lingulata*. Tongue-leaved Tillandsia. Linn. Sp. Pl. 409. Willd. n. 3. Ait. n. 3. Jacq. Amer. 92. t. 62. (Caraguata latifolia clavata; Plum. Ic. 63. t. 74. *Viscum caryophylloides maximum*, capitulis in summitate conglomeratis; Sloane Jam. v. 1. 189. t. 120.)—Leaves flat, somewhat tongue-shaped, smooth, entire, as well as the crowded bractees.—Native of old trees in the vast forests of Martinico, as well as of Jamaica, where it is said to collect water, like the first species. In size it agrees with the second, but the entire *leaves*, and the close leafy head or spike of *flowers*, abundantly distinguish that before us. Jacquin says the *flowers* are yellow, inodorous, three inches long.

4. *T. tenuifolia*. Slender-leaved Tillandsia. Linn. Sp. Pl. 410. Willd. n. 4. Swartz Ind. Occ. v. 1. 591. (Renalmia spicâ multiplici, angustifolia, flore cæruleo; Plum. Ic. 234. t. 238. f. 2. *Viscum caryophylloides minus*, foliorum imis viridibus apicibus subrubicundis, flore tripetalo purpureo, femine filamentoso; Sloane Jam. v. 1. 190. t. 122. f. 1.)—Leaves linear-thread-shaped, channelled, erect, taper-pointed. Spikes alternate, imbricated. Flowers two-ranked.—Parasitical, like all the foregoing, on the branches of trees in the West Indies. The *stem* is a foot high, simple, entirely concealed by the broad sheaths of the *leaves* which clothe it. The radical *leaves* are very numerous, above a span long, very slender, resembling those of some long-leaved kinds of *Pinus*, but more tapering and channelled; moderately dilated, sheathing, downy and rusty, at the base. Those of the stem are much shorter, and almost setaceous, though their base is still broader. *Spikes* three or four, alternate, sessile, imperfectly two-ranked, lanceolate, an inch long, proceeding from broad sheathing *bractees*. *Flowers* imbricated in two rows, blue. Linnæus quotes by mistake a synonym of Jacquin, belonging to the following.

5. *T. flexuosa*. Zigzag Tillandsia. Swartz Ind. Occ. 590. Willd. n. 5. Ait. n. 4. (*T. tenuifolia*; Jacq. Amer. 92. t. 63.)—Leaves linear-lanceolate, channelled, recurved. Spikes lax, zigzag. Flowers two-ranked, distant.—On trees near the sea in Jamaica, as well as near Carthage in South America. Extremely unlike the last. The *leaves* are very broad and concave in their lower part, convoluted about the base of the stem, green, elegantly marked with broad, whitish, minutely scaly, transverse stripes; their points recurved in all directions. *Stem* twice as tall as the leaves, being two or three feet high, mostly subdivided in the upper part, invested with close red sheaths, and terminating in two or three long, lax, zigzag *spikes*, with triangular stalks. *Flowers* about an inch or more asunder. *Calyx* coloured, near an inch long. *Corolla* still longer, with reflexed segments, at first blue, then red, as we presume from Dr. Swartz's description and the analogy of *T. striata* hereafter described. *Capsule* long, of three cells, the valves black and shining on the inside.

6. *T. setacea*. Setaceous Tillandsia. Swartz Ind. Occ. 593. Willd. n. 6.—Leaves linear-thread-shaped, recurved, nearly smooth. Spike simple, with two-ranked imbricated sheaths.—Found on trees in Jamaica. *Stem* a foot or more in height, round, nearly upright, clothed with alternate, broad, bristle-pointed sheaths. Radical *leaves* nearly equal in length to the stem, numerous, sheathing at the base, greyish, rigid, somewhat mealy as it were, with very minute scales.

TILLANDSIA.

scales. *Spike* terminal, solitary, ovato-lanceolate. *Flowers* alternate. Most like *T. tenuifolia*, n. 4, but differing in its recurved *leaves*, and simple solitary *spike*.

7. *T. paniculata*. Panicked Tillandsia. Linn. Sp. Pl. 410. Willd. n. 7. Lamarek v. 1. n. 6. (Renalmia ramossissima, floribus variegatis et circinatis; Plum. Ic. 233. t. 237.)—Radical leaves very short, lanceolate. Stem panicked, twice compound. Spikes erect. Segments of the corolla linear, spiral.—Native of South America. We know nothing of this species but from Plumier, whose figure represents numerous, crowded, erect, concave radical leaves, and a stem alternately branched from the very bottom, with two-ranked reclining branches, laden with ascending spikes. A copy, in our possession, of his original drawing shews the flowers to be four inches long.—We have no good authority for Browne's synonym, cited by authors, nor does it, if correct, throw any light upon this very obscure species. Lamarck informs us, from Plumier's manuscripts, that the stem is sometimes taller than a man; that the calyx is spotted with green and purple; corolla of a violet blue, dotted with purple, its long narrow segments becoming spiral as they expand. This is the circumstance to which Plumier's definition alludes. His greatly reduced plate is not sufficiently exact to explain it, and Linnæus inaccurately copied foliis for floribus, in which Willdenow, of course, follows him without the least enquiry.

8. *T. fasciculata*. Fasciculated Tillandsia. Swartz Ind. Occ. 586. Willd. n. 8.—“Leaves lanceolate-awl-shaped, erect, straight. Spikes lateral, two-ranked, imbricated.”—Found on trees in Jamaica, in thickets near the sea-shore. Stem one or two feet high, leafy, simple. Radical leaves broad, concave, and sheathing, at the base; lanceolate and tapering upward, very slightly recurved; downy externally; those of the stem shorter, somewhat imbricated, ovate, with long awl-shaped points. Spikes alternate, lateral and terminal, two-edged, an inch broad, with imbricated ovate bractæas, membranous at the margin. Flowers solitary. Capsule an inch long. Swartz. Lamarck's *T. clavata*, cited by Willdenow with a mark of doubt, belongs to *T. monostachya*, n. 11, as evidently appears from Plumier's synonym, the figure belonging to which these writers overlooked.

9. *T. nutans*. Nodding Tillandsia. Swartz Ind. Occ. 588. Willd. n. 9. Ait. n. 5.—“Leaves ovato-lanceolate, membranous. Stem nearly naked. Spikes subdivided, drooping. Flowers separate, ovate.”—Native of branches of trees on hills in Jamaica. Plant from one to two feet high. Leaves all radical, tumid at the base, striated lengthwise, smooth, much shorter than the stem, which is round, clothed with membranous striated sheathing scales. Spikes alternate, rather distant, drooping, with angular stalks. Flowers distinct, near each other, but not imbricated. Corolla white. Capsule roundish-ovate. Swartz.

10. *T. polystachya*. Many-spiked Tillandsia. Linn. Sp. Pl. 410. Willd. n. 10. (Renalmia spica multiplici, flore albo; Plum. Gen. 37; also as Linnæus supposed, R. alia, spica multiplici, angustifolia; ibid. 37. Viscum caryophylloides angustifolium, floribus cæruleis; Catseb. Carol. v. 2. 89. t. 89?)—“Stalk bearing imbricated lateral spikes.”—Native of South America. We can make out nothing further of this species, nor how Linnæus came to a knowledge of it, there being no specimen in his herbarium. Swartz however appears to be acquainted with the plant; see his remarks under n. 13. and 14.

11. *T. monostachya*. Single-spiked Tillandsia. Linn. Sp. Pl. 410. Willd. n. 11. (*T. clavata*; Lamarck Dict. v. 1. n. 4. Renalmia clavata, floribus niveis; Plum. Ic.

233. t. 238. f. 1. R. non ramosa squamata, et floribus niveis; Plum. Gen. 37.)—Leaves radical, linear, channelled, recurved; broad and sheathing at the base. Stem simple, clothed with imbricated scales. Spike simple. Bractæas ovate, concave.—Native of the West Indies. Plumier gathered it on old trees in Hispaniola. The numerous radical leaves spread widely in every direction, being about a foot long, and two inches broad, so much recurved that their points touch the branch on which the plant is fixed. Stem from fifteen to eighteen inches high, erect, round, firm, quite simple, as well as its spike. Bractæas white, streaked or dotted with red. Corolla snow-white; its limb in three deep ovate segments.

12. *T. pruinosa*. Frosted Broad-leaved Tillandsia. Swartz Ind. Occ. 594. Willd. n. 12.—Leaves lanceolate, taper-pointed, recurved, clothed with shaggy scales. Spike simple, with imbricated, pointless, downy bractæas.—Found on the arms and items of aged trees in Jamaica, as well as in Brazil. Stem a foot or more in height, simple, leafy. Radical leaves a foot long, spreading variously, near an inch broad at the bottom, but soon contracted into a long taper point, flat, densely clothed all over with shaggy, torn, peltate, shining scales, the marginal ones flat, imbricated, and much dilated; stem-leaves much shorter and narrower. Spike terminal, solitary, simple, an inch long, ovate. Bractæas ovate, bluntish, concave. Corolla blue, longer than the bractæas. Capsule oblong, triangular, smooth.

13. *T. canescens*. Hoary Tillandsia. Swartz Ind. Occ. 595. Willd. n. 13.—“Radical leaves linear, erect, hoary, as tall as the stem. Spikes about three, terminal.”—Native of Jamaica, on trees near the sea-shore. Perennial, about a foot high, with short, simple, curling, fibrous roots. Stem simple, leafy. Radical leaves imbricated, linear, rigid, whitish or hoary; with very broad, ovate, concave, tumid, membranous, sheathing bases; stem-leaves tapering, acute, with more lax sheaths. Spikes usually three, crowded at the top of the stem, sessile, ovate, acute, flattish. Bractæas two-ranked, imbricated, ovato-lanceolate, smooth. Corolla red, with long segments. Nearly related to *T. polystachya*, but that species is taller, with recurved, zigzag, smooth leaves, and numerous, scattered, lanceolate spikes. Swartz.

14. *T. angustifolia*. Narrow and long-leaved Tillandsia. Swartz Ind. Occ. 596. Willd. n. 14.—“Leaves linear-lanceolate, nearly erect, smooth, taller than the stem. Spikes somewhat clustered.”—Found on the trunks and branches of trees, in Jamaica and Hispaniola. Perennial. Stem two feet high, nearly upright, simple, leafy. Leaves all imbricated, broad and sheathing at the base, lanceolate, narrow towards the end, straight, striated; the sheaths of the radical ones broadest, and rather inflated. Spikes numerous, scattered, somewhat clustered, alternate, separated by leafy sheaths, imperfectly imbricated, compressed, lanceolate, many-flowered, an inch and half long. Flowers two-ranked. Bractæas imbricated, equitant, ovate, pointed, keeled, striated, smooth. Capsules elongated, pointed, triangular, smooth, extending beyond the bractæas. This likewise is cautiously to be distinguished from *T. polystachya*, by having more upright leaves, longer than the stem, and the spikes separated by leafy sheaths. Swartz. Nothing is mentioned respecting the colour of the flowers.

15. *T. striata*. Frosted Stiff-leaved Tillandsia. Gawler in Curt. Mag. t. 1529. Ait. Epit. 375. Banks Ic. Ined.—Leaves chiefly radical, linear-lanceolate, channelled, recurved, minutely scaly at the back. Stem simple. Spike solitary. Bractæas ovate, concave, imbricated, glaucous, smooth.—Found by Dr. Solander, on trees near Rio Janeiro, in Brazil. Said to have been introduced into the European

florès,

TILLANDSIA.

stoves, by lady Neale, about the year 1799. The *root* is somewhat tuberous, with many tough smooth fibres. *Stem* about six inches high, furrowed, and almost concealed, by the dense tuft of very numerous radical *leaves*, which are sometimes all curved to one side, five or six inches long, pale green, frosted, as it were, with hoary scaly pubescence, thickest towards the base. *Spike* three inches long, simple, many-flowered, with beautiful large white *bractæas*, tinged and tipped with rose-colour; the lower ones ending in leafy points. *Calyx* of the colour of the *bractæas*, but hardly so long. *Corolla* with obtuse, emarginate, convolute segments, at first of a rich deep blue, but finally changing to a deep red. *Capsule* dark brown, an inch long. This is, no doubt, very different from *T. monostachya*, though Linnæus's account of that species may be, as justly hinted in the Bot. Mag., incomplete. *T. striata* flowers in November. It is said to live and blossom when suspended by a thread in a warm room. Few plants are more elegant or singular.

16. *T. recurvata*. Recurved-leaved Tillandsia. Linn. Sp. Pl. 410. Willd. n. 15. Ait. n. 6. Pursh n. 1. Swartz Obs. 121. (*Viscum caryophylloides minus, foliis pruinæ instar candicantibus, flore tripetalo purpureo, femine filamentoso*; Sloane Jam. v. 1. 190. t. 121. f. 1.)—Leaves radical, awl-shaped, scaly, recurved. Stalks naked, two-flowered.—Native of the trunks of old rotten trees, in Jamaica and the Brasils, as well as in Florida and Georgia, growing in dense tufts. The *stems* are very short, clothed with crowded, spreading, recurved, sheathing *leaves*, two or three inches long, downy, with minute hoary scales. *Stalks* terminal, solitary, four inches high, slender, round, naked and smooth, each bearing at the top two upright *flowers*, enveloped in a pair of sheathing, furrowed, dotted *bractæas*. Segments of the *corolla* blue, obtuse, scarcely extending beyond the *calyx*. *Anthers* yellow. *Capsule* an inch long, slender, brown and shining, enveloped in the pale segments of the permanent *calyx*, which are as long, and nearly as broad, as the valves.—Sloane says it draws its nourishment from rain water, falling into the cavity made by the leaves.

17. *T. usneoides*. Long-moss Tillandsia. Linn. Sp. Pl. 411. Willd. n. 16. Pursh n. 2. (*Viscum caryophylloides tenuissimum, e ramulis arborum musci in modum dependens, foliis pruinæ instar candicantibus, flore tripetalo, femine filamentoso*; Sloane Jam. v. 1. 191. t. 122. f. 2, 3. *Cuscuta ramis arborum innascens, &c.*; Pluk. Phyt. t. 26. f. 5; also f. 6.)—Stem much branched, thread-shaped, twisted, minutely scaly, as well as the awl-shaped channelled leaves.—Native of shady woods from Virginia to Florida, as also of the West Indies and the Brasils, flowering in July. The long wiry contorted *stems* creep over the stems and branches of old trees, and even along a rope or hair line, if put in their way, the *roots* scarcely fixing themselves, or deriving any sustenance, from either. The *flowers* are, according to Mr. Pursh, of a yellowish-green. When the hoary shaggy coat of the plant is separated by beating or rubbing, the remains of the stems look like a mass of curling black horse-hair, and serve, like that, to stuff mattresses, &c. In this denuded state the stems are represented, along with the perfect plant, by Sloane as well as Plukenet.

M. Poiret, in Lamarck Dict. v. 7. 666—673, has greatly enriched this genus, not only with all the species published by Dr. Swartz, and which we likewise have adopted, but also with ten besides, adopted from the *Flora Peruviana* of Ruiz and Pavon. That our work may not be incomplete, we shall briefly mention these in the order in which M. Poiret has arranged them, trusting to him for the references, which we have not the means of consulting. He introduces them all,

except the last, between the *angustifolia*, our n. 14, and *recurvata*, n. 16.

18. *T. tetrantha*. Four-flowered Tillandsia. Poiret n. 9. Fl. Peruv. v. 3. 39. t. 265.—Leaves radical, lanceolate, imbricated; recurved at the point. Stem erect. Stalks reflexed, four-flowered.—Grows on trees and rocks in the forests of the Andes, flowering in July and August.—*Root* of many fibres. *Leaves* radical, large, spotted with red. *Stems* solitary, rather longer than the leaves, zigzag, clothed with oval, pointed, close, scaly *bractæas*, of a purplish rose-colour; the upper ones spreading almost horizontally, each of the latter bearing an axillary *stalk*, supporting four, nearly sessile, *flowers*. *Calyx* yellow, coriaceous. *Corolla* violet.

19. *T. maculata*. Spotted-leaved Tillandsia. Poiret n. 10. Fl. Peruv. v. 3. 40. t. 267.—Leaves radical, lanceolate-sword-shaped, shining; revolute at the point. Panicle alternately branched. Spikes nearly simple, many-flowered.—Native of rocks and trees, in the middle of the great forests of the Andes, flowering from July to September. The *leaves* are channelled, polished on both sides, covered with red or purplish spots. Every part of the plant is often red. *Stems* three feet high, simple, jointed, with an oval scale, or *bractea*, at each joint. *Panicle* terminal, eighteen inches long, red, composed of alternate, nearly simple, *spikes*, furnished with numerous, oval-lanceolate, pointed *bractæas*, reddish as well as the *calyx*. *Corolla* violet, small.

20. *T. rubra*. Red Tillandsia. Poiret n. 11. Fl. Peruv. v. 3. 40. t. 266.—Leaves radical, sword-shaped, somewhat pointed. Panicle simple, spikes undivided.—Native of rocks in Peru, flowering in March and April. The *leaves* are about two feet long, spreading or recurved; of a shining green above; silvery white beneath. *Stems* solitary, erect, two or three feet high; clothed with sheathing scales below; terminating in a straight reddish *panicle*, composed of many simple, alternate, oblong, lanceolate, divaricating *spikes*. *Bractæas* red, pointed, keeled, an inch in length. *Flowers* imbricated, sessile. *Calyx* yellowish-red. *Corolla* small, violet, with reflexed segments.

21. *T. parviflora*. Small-flowered Tillandsia. Poiret n. 12. Fl. Peruv. v. 3. 41. t. 269.—Leaves radical, awl-shaped, greatly dilated at the base. Panicle simple. Spikes from three to seven. Flowers two-ranked.—On rocks in the forests of the Andes, flowering from August to October. *Leaves* very numerous, from six to nine inches long, channelled, spreading, whitish, clothed with a multitude of mealy scales. *Stems* a foot high, slender, simple, purplish, with distant, awl-shaped, channelled, whitish, short *stem-leaves*, and oval whitish *bractæas*. *Flowers* small, white, alternate, on zigzag partial stalks. *Capsule* almost eight times as long as the *calyx*.

22. *T. biflora*. Two-flowered Tillandsia. Poiret n. 13. Fl. Peruv. v. 3. 41. t. 268.—Leaves sword-shaped, acute. Stem racemose. Flowers in pairs.—Found on the Andes, flowering in August and September. This species is often prolific. *Leaves* nearly equal, straight, spreading, striated. *Stems* solitary, simple, eighteen inches high, covered with lanceolate scaly *sheaths*, or *stem-leaves*, and terminating in a simple *cluster*, six inches long. *Flowers* on short stalks, in alternate pairs, furnished with elongated, lanceolate, striated *bractæas*, recurved and pale green at their extremity. *Capsules* yellowish, an inch long.

23. *T. purpurea*. Rose-coloured Tillandsia. Poiret n. 14. Fl. Peruv. v. 3. 41. t. 270.—Leaves sword-shaped, tapering, channelled, recurved, clothed with mealy scales. Panicle of many spikes. Flowers two-ranked.—Found on
little

little hills about Lima, and in other sandy or stony situations in Peru, flowering in June and July. The perennial root throws out many prostrate trailing shoots. Leaves spreading, six to nine inches long, whitish. Stems solitary, a foot high, simple, clothed with long awl-shaped sheaths. Panicle rose-coloured, of from five to nine alternate spikes, with oval, concave, whitish bractees. Flowers sessile, with rose-coloured bractees and calyx. Corolla dark purple, with a white tube. Capsule pale; deep purple within.

24. *T. heptantha*. Seven-flowered Tillandsia. Fl. Peruv. v. 3. 21. (*T. heptandra*; Poiret. n. 15.)—Leaves radical, sword-shaped, tapering, very acute. Spike solitary, simple, of about seven flowers.—Native of rocks and trees, among precipices, in Peru, flowering from June to August. Leaves whitish, and rather downy. Stem near a foot high, quite simple, scaly. Flowers sessile, in two ranks, with lanceolate violet-coloured bractees. Corolla white, tipped with violet. We presume that M. Poiret has erred in his specific name.

25. *T. seffiliflora*. Sessile-flowered Tillandsia. Poiret n. 16. Fl. Peruv. v. 3. 42. t. 271.—Leaves radical, tongue-shaped, flat, obtuse. Spike solitary, simple.—Native of Peru, flowering in November and December. Root biennial. Plant smooth. Leaves eight or nine inches long, and an inch broad; the outer ones gradually smaller. Stems slender, a foot high, jointed, clothed with obtuse sheaths. Spike six inches in length. Flowers alternate, solitary, each with an oval, concave, acute bractea. Corolla of a violet purple on the inside.

26. *T. capillaris*. Capillary Tillandsia. Poiret n. 17. Fl. Peruv. v. 3. 42. t. 271. f. C.—Leaves linear-awlshaped. Stem forked. Stalks axillary, mostly single-flowered, capillary, smooth, thrice as long as the leaves.—On rocks, walls, and trees, in Peru, flowering in November and December. This species is said to be related in many respects to the *T. recurvata*, n. 16, but differs in having forked stems; more numerous and broader leaves, contracted at their base, and not recurved; capillary flower-stalks; and solitary bractees to each flower. (We would observe that the last character is found in the *recurvata*.) The plant forms dense, leafy, whitish, tufts, the leaves being clothed with very minute mealy scales. Stems about six inches high, forked several times, furnished with two-ranked, crowded, imbricated, reflexed, linear-awlshaped leaves, striated at their base, and half clasping the stem. Stalks straight, bearing one or two flowers, with a solitary, ribbed, smooth bractea, and a leaf at their base. Calyx scarious, deep violet. Corolla white, hardly longer than the calyx. Anthers yellow. Capsules linear, twice the length of the calyx, dark violet within.

27. *T. virescens*. Greenish Tillandsia. Poiret n. 20. Fl. Peruv. v. 3. 43. t. 270. f. B.—Leaves linear-awlshaped. Stalks axillary, single-flowered, the length of the leaves, with a solitary convoluted bractea.—Native of rocks in Peru, flowering in December and January.—A small species, forming dense, proliferous, whitish, warty tufts. Leaves imbricated in two rows, reflexed at the point, striated at the base. Flowers pale yellow. Capsule green, twice the length of the calyx; internally dark-purple.

TILLANJONG, in *Geography*, one of the Nicobar islands, in the Indian sea. N. lat. $8^{\circ} 40'$. E. long. $94^{\circ} 9'$.

TILLE, LA, a river of France, which runs into the Saône, about 3 miles below Auxonne.

TILLÉ, a town of France, in the department of the Oise; 3 miles N. of Beauvais.

TILLEE, a town of Bengal; 28 miles N.W. of Dacca.

TILLEMANS, PETER, in *Biography*, was born at

Antwerp in 1684, and visited England in 1708, where he attracted attention by his excellent copies from the pictures of Bourgoigne and Teniers, of whose works he preserved the freedom and spirit. He also painted landscapes with small figures, views of gentlemen's seats, sea-ports, &c. and met with very considerable employment. The duke of Devonshire favoured him, and for him he painted a picture of Chatsworth, which gained him considerable eclat. He died here in 1734.

TILLEMONT, LOUIS SEBASTIAN LE NAIN DE, a French ecclesiastical writer, was born at Paris in 1637; and in the school of the Port-Royal, into which he was admitted at the age of ten, he discovered promising talents and a pious disposition. From early life he devoted himself to the study of ecclesiastical antiquity, and made collections, principally relating to the first six centuries, with a view of composing a history of the church. Modest and diffident, as well as learned, he deferred taking priests' orders till his 40th year; and having done this, he declined all preferment, and retired first to Port-Royal-des-Champs, and then to Tillemont, near Vincennes, prosecuting his literary labours, and keeping in view his main object: he subjected himself at the same time to very rigid penitentiary discipline. His austerities and intense application debilitated his constitution to such a degree, that he died in 1698, at the age of 61 years.

The plan of his great work comprehended two parts, viz. the secular and the ecclesiastical history of the period of which he proposed to treat. Accordingly the first part, entitled "Memoires pour servir a l'Histoire Ecclesiastique des six premiers Siècles," was comprised in 16 vols. 4to. of which four volumes were published in his life-time, and twelve more after his death. The other part, entitled "L'Histoire des Empereurs et des autres Princes qui ont régné durant les six premiers Siècles de l'Eglise," consists of 6 vols. 4to. the last being left in MS. and not published till 1738, finishing with the emperor Anastasius. Dupin, though he disapproves the method of Tillemont, observes, that great instruction may be derived from his history, especially with respect to critical and chronological matters. His style merits no commendation. Gibbon, who often quotes his History of the Emperors, and praises his scrupulous accuracy, finds frequent occasion to censure his bigotry, and remarks, that "he never dismisses a virtuous emperor without pronouncing his damnation." Moreri. Gen. Biog.

TILLENENSEE, in *Geography*, a lake of Prussia, 8 miles W. of Lick.

TILLER, or TILLAR, in *Husbandry*, a little young tree, left to grow till it be fellable.

TILLER is also a term used by farmers to signify, that the produce of the grain branches out into several stalks; in which sense it denotes the same thing with the Latin word *fruticare*.

It has been suggested by the writer of the "Elements of Agricultural Chemistry," that in the tilling of corn, that is, the production of new stalks round the original plume, there is every reason to believe that oxygen must be absorbed; for the stalk at which the tilling takes place, always contains sugar, and the shoots arise from a part which is deprived of light. The drill-husbandry is therefore supposed to favour this process; as loose earth is thrown by the hoeing round the stalks; and they are preserved from light, and yet supplied with oxygen. The writer has counted from forty to one hundred and twenty stalks produced from a grain of wheat, in a moderately good crop of the drilled kind. And we are informed, it is said, by sir Kenelm Digby, in 1660, that there was

in the possession of the fathers of the Christian doctrine at Paris, a plant of barley, which they, at that time, kept by them as a curiosity, and which consisted of two hundred and forty-nine stalks springing from one root, or grain; and in which they counted above eighteen thousand grains, or seeds of barley.

It is noticed, too, that the great increase which takes place in the transplantation of wheat, depends upon the circumstance, that each layer thrown out in tillering may be removed, and treated as a distinct plant.

The following statement is given in the fifty-eighth volume of the Philosophical Transactions, at p. 203: Mr. C. Miller of Cambridge sowed some wheat on the 2d of June, 1766; and on the 8th of August, a plant was taken and separated into eighteen parts, and replanted; these plants were again taken up, and divided in the months of September and October, and planted out separately to stand the winter, which division produced sixty-seven plants. They were again taken up in March and April, and produced five hundred plants: the number of ears thus formed from one grain of wheat was twenty-one thousand one hundred and nine, which gave three pecks and three-quarters of corn, that weighed 47lbs. 7 oz.; and that were estimated at five hundred and seventy-six thousand eight hundred and forty grains.

There is a number of facts and cases of the vast increase of grain crops by tillering, scattered through the writings on agriculture and husbandry, which clearly shew the great utility and importance of it in the raising of such crops.

TILLER of a Ship, a long piece of timber (which should be straight-grained and free from knots) fitted into the head of the rudder as a lever, to turn it from one side to the other, in order to steer the ship. This term, or *bich*, is used for the handle of a boat's rudder.

TILLER-Rope, a kind of tackle, communicating with the ship's side, and usually composed of untarred rope-yarn for the purpose of traversing more readily through the blocks or pulleys: this tackle serves to guide and assist the operations of the tiller, and in all large vessels is wound about a wheel, which acts upon it with the powers of a crane or windlass.

TILLERING, in *Agriculture*. See **TILLER**.

TILLEWALL, in *Geography*, a town of Prussia, in Oberland; 5 miles N.E. of Eylau.

TILLIERES, a town of France, in the department of the Eure; 6 miles N.E. of Verneuil.

TILLING, a town of Sweden, in the province of Up-land; 23 miles S.E. of Upsal.

TILLONGCHOOL, or **KATCHAL**, in *Geography*, one of the Nicobar islands, of a triangular form, about 36 miles in circumference. N. lat. 7° 58'. E. long. 93° 50'.

TILLOT, LE, a town of France, in the department of the Vosges; 12 miles S.E. of Plombières.

TILLOTSON, JOHN, in *Biography*, a celebrated English prelate, descended from an ancient family in Cheshire, was the son of Robert Tillotson, a clothier at Sowerby, in the parish of Halifax, Yorkshire, where he was born in the year 1630. Having been brought up in the principles of his father, who was a Calvinistic puritan, and discovering an inclination to literature, he was entered in his 17th year a pensioner of Clare-Hall, Cambridge. In 1651 he was elected fellow of his college, and took pupils, to whose moral and religious instruction he was duly attentive. At this time, he was in his sentiments Calvinistic, heard such

preachers, and used extemporaneous prayer. His views of theology were enlarged soon after he left college in 1656, by the perusal of Chillingworth's "Religion of Protestants." But retaining his attachment to the Presbyterian form of church government, he was received into the family of Edmund Prideaux, attorney-general to the Protector, as chaplain and tutor to his son. He attended the Savoy conference in July 1661, and preached a sermon (the first which he preached) at their morning exercise in Cripplegate, in the month of September. Under the Act of Uniformity in 1662, to which he submitted, he became curate at Cheshunt, in Hertfordshire. In London he was much admired as a preacher, and was chosen minister by one of the parishes, but declined accepting the office, because the vacancy had been occasioned by the refusal of Mr. Edm. Calamy to comply with the Bartholomew Act. From a rectory in Suffolk, to which he was presented, he removed to the office of preacher to the society at Lincoln's Inn. In 1664 he married the daughter of Dr. French, canon of Christchurch, by a sister of Oliver Cromwell; and in 1665 he was appointed lecturer to the parish of St. Laurence Jewry. His reputation as a preacher was very considerably increased at this time by his printed sermon, "On the Wisdom of being religious." His controversy on popery commenced with the publication of his "Rule of Faith," in answer to a book written by a convert to the Romish church. The part he took in a scheme for comprehending dissenters under the establishment, evinced his respect for that description of Christians and Protestants. (See **COMPREHENSION**.) In 1666 he took his degree of D.D., and in 1669 he was made a king's chaplain, and was presented to a prebend of Canterbury. When king Charles, in 1672, issued a declaration for liberty of conscience, with a view of favouring the Roman Catholics, the bishops took the alarm, and recommended to the clergy to preach against popery. The king was displeased, and Tillotson, at a meeting of the clergy convoked by the bishop of London, suggested the following apology for their conduct: "That since his majesty professed the Protestant religion, it would be an unprecedented thing that he should forbid his clergy to preach in defence of a faith which they believed, and which he declared to be his own." Soon after this he preached a sermon at Whitehall on the hazard of salvation in the church of Rome; and yet, offensive as this sermon must have been, he was advanced, in 1672, to the deanery of Canterbury, which was followed, in 1673, by a presentation to a prebend of St. Paul's. At this time he published Dr. Wilkins's "Principles of Natural Religion," with a recommendatory preface; and the author, who died in his house, committed to him the disposal of his papers. A similar trust was reposed in him by Dr. Barrow. His dread of popery induced him, in 1680, to preach before the king a sermon, afterwards published by the royal command, and entitled "The Protestant Religion vindicated from the Charge of Singularity and Novelty." In this sermon a paragraph was introduced which incurred the charge of intolerance. "I cannot think," says he, "till I be better informed, which I am always ready to be, that any pretence of conscience warrants any man that is not extraordinarily commissioned, as the apostles and first preachers of the gospel were, and cannot justify that commission by miracles, as they did, to affront the established religion of a nation, though it be false, and openly to draw men off from the profession of it, in contempt of the magistrate and the law. All that persons of a different religion can in such a case reasonably pretend to is, to enjoy the private liberty and exercise of their own conscience and religion, for which

they ought to be very thankful, and to forbear the open making of profelytes to their own religion, (though they be never so sure that they are in the right,) till they have either an extraordinary commission from God to that purpose, or the providence of God make way for it by the permission of the magistrate." The king slept while the preacher delivered the sermon, but a nobleman at the close of it said to him, "It is a pity your majesty was asleep, for we have had the rarest piece of Hobbism that ever you heard in your life," to which Charles replied, "Oddsfish, then he shall print it," which was the cause of the order. The paragraph was unworthy of Dr. Tillotson, and gave very general offence, both to the established clergy and Presbyterians. Tillotson was an ardent promoter of the Bill of Exclusion, nor would he concur in the address of the London clergy to the king on his declaration that he could not consent to such a bill. In 1682 he took occasion to vindicate the character of Dr. Wilkins from the aspersions of Anthony Wood, by a preface to a volume of sermons, which he published from the doctor's MSS. He was also the editor, in 1683, of Dr. Barrow's sermons, in 3 vols. fol. It has been regretted as an inconsistency in the character of Tillotson, that when in company with Burnet he attended lord Russel preparatory to his execution, they should urge this martyr to liberty to acknowledge the absolute unlawfulness of resistance, though they were soon after decided friends to the revolution. By a "Discourse against Transubstantiation," and another "Against Purgatory," he commenced a prolonged controversy with the Papists. In 1685 he avowed himself a warm advocate for affording charitable relief to the French refugees, on the repeal of the edict of Nantes; and in reply to Dr. Beveridge, the prebendary of Canterbury, who objected to reading a brief for this purpose, as contrary to the rubric, he remonstrated, by saying, "Doctor, Doctor, charity is above rubrics." After the settlement of the prince of Orange at St. James's, he was instrumental in persuading the princess Anne, who consulted him, to acquiesce in giving up her claim to the crown during the life of William, in case of her sister's dying before him. After the revolution, no obstacle remained to the full gratification of his desires of advancement, which, however, he professed to be very limited. In 1689 he was appointed clerk of the closet to the king, and permitted to exchange the deanery of Canterbury for that of St. Paul's. During archbishop Sancroft's suspension for refusing to take the oaths to the new government, Dr. Tillotson was appointed to exercise the archiepiscopal jurisdiction; and it was then determined that he should have possession of the see. His whole conduct at this time evinced his attachment to the principles of toleration and civil liberty; and he was active in his endeavours for promoting a comprehension, though they ultimately proved unsuccessful. He also failed in introducing a new book of Homilies; and in a sermon preached before the queen, against the absolute eternity of hell torments, he excited the resentment and opposition of the orthodox party. After some reluctance on his part, he was consecrated to the archbishopric of Canterbury in May 1691, and also in a little while sworn a member of the privy-council. From this time he became very obnoxious to the high-church zealots, who attacked him in a variety of ways. Among other charges against him, one was his attachment to Socinian principles, which seems to have had no other foundation than his rational defence of Christianity, and his friendship and intercourse with Locke, Limborch, and Le Clerc; and for repelling which, he caused to be republished, in 1693, four of his sermons "On the Divinity and Incarnation of our

Saviour."—"If this be Socinianism, for a man to inquire into the grounds and reasons of the Christian religion, and to endeavour to give a rational account of it," says he in one of his posthumous sermons, alluding to this charge, and also to the character of Chillingworth, "I know no way but that all considerate inquisitive men, that are above fancy and enthusiasm, must be either Socinians or Atheists." Dr. Jortin, in reference to this unfounded accusation, observes, "Tillotson had made some concessions concerning the Socinians, which never were, nor ever will be, forgiven him, and had broken an ancient and fundamental rule of theological controversy: 'Allow not an adversary to have either common sense, or common honesty.'" After an examination of bishop Burnet's exposition of the thirty-nine articles, which he sent him in MS., he concludes his eulogy on the bishop's prudence and ability with observing, "The account given of Athanasius's creed seems to be no-wise satisfactory; I wish we were well rid of it." The archbishop's assiduity and zeal in the duties of his exalted station were highly exemplary and laudable; and yet they were not sufficient to silence the clamours of his enemies. At length the period of his usefulness terminated, in consequence of a paralytic stroke, which seized him, November 1694, in the chapel of Whitehall, and which, on the fifth day, proved fatal, in the 65th year of his age. His funeral, at the church of St. Laurence Jewry, was attended by many persons of rank. He left a widow, but no children; and as he took no pains to accumulate property, his debts could not have been paid, if the king had not remitted his first-fruits; and the copy-right of his sermons was the only provision which he left for his widow, to which a pension, settled upon her by the crown, was added.

"The temper and character of Dr. Tillotson," says one of his biographers, "were intitled to every encomium. He was humble, open, and sincere, of kind and tender affection, extremely bountiful in his charities, and forgiving of injuries, in which last virtue he was severely tried. His public principles bore the stamp of his disposition; they were philanthropical, tolerant, and liberal; and if he retained some predilections for the sect in which he had been educated, the chief professional fault with which he has been charged, candour will make due allowance for the effect of early habit. In some points he was, perhaps, too compliant, and was led into some inconsistencies; but the times were difficult, and his intentions seem to have been always pure. As a writer, he is principally remembered for his sermons, which have long maintained a place amongst the most popular compositions of that class in the English language. A folio volume, comprising his "Rule of Faith," and sermons, was printed in his life-time; and after his death two more folio volumes of sermons were published by his chaplain, Dr. Barker. Abroad, as well as at home, his works have been held in high estimation. The character given of them by Le Clerc, in his "Bibliotheque Choisie," is as follows: "The archbishop's merit was beyond any commendation he could give. It consisted in the union of extraordinary clearness of head, great penetration, an exquisite talent of reasoning, a profound knowledge of genuine theology, solid piety, a most singular perspicuity, and unaffected elegance of style; with every other quality that could be desired in a man of his order; and whereas compositions of this kind are commonly mere rhetorical and popular declamation, better to be heard from the pulpit than read in print, his are for the most part exact dissertations, capable of bearing the test of the most rigorous examination." Addison considered the sermons of Tillotson as a standard of purity of the English language. Dryden acknowledges,

that if he had any talent for English prose, it was derived from frequent perusal of Tillotson's writings. Mr. Melmoth, however, in his "Fitz Osborne's Letters," expresses a very different, and in our judgment a less just, or to say the least of it, a less candid opinion. He speaks of "his words as frequently ill chosen, and almost always ill placed; his periods as tedious and unharmonious; and his metaphors as generally mean, and often ridiculous." Notwithstanding these reflections, Tillotson's sermons, though surpassed by the correctness and elegance of modern compositions in this department, and less perused than formerly, will not cease to be regarded as a valuable part of English literature. Birch's Life of Archbishop Tillotson. Biog. Brit. Gen. Biog.

TILLS, in *Agriculture*, a term signifying tares or vetches in many places, in both the northern and southern parts of the kingdom.

TILLURAH, in *Geography*, a town of Bengal; 21 miles E.N.E. of Purneah.—Also, a town of Hindoostan, in Bahar; 22 miles S. of Patna. N. lat. 25° 14'. E. long. 85° 22'.

TILLY, a town of Canada, on the St. Laurence; 10 miles S.W. of Quebec.—Also, a town of France, in the department of the Meuse; 9 miles S. of Verdun.—Also, a town of France, in the department of the Eure; 7 miles S.E. of Grand Andelys.—Also, a town of France, in the department of the Sambre and Meuse; 6 miles W. of Gemblours.

TILLY la Campagne, a town of France, in the department of the Calvados; 4 miles S.S.E. of Caen.

TILLY Verolle, a town of France, in the department of the Calvados; 9 miles W. of Caen.

TILLY Land, in *Agriculture*, that sort which is, for the most part, constituted and composed of materials of the till kind.

These kinds of land, in their original states, are in general of a very barren and unproductive nature; but when they have been fully turned over by the plough or other means, well and effectually wrought and reduced by other proper tools, and their parts completely divided and exposed to the alternate action of different agents, such as those of frost and thaw, of drought, dews, and rain, with the many other improving effects of the atmosphere which surrounds them; and withal stimulated, separated in their parts, and enriched by calcareous and other suitable manures and substances, they become, in various instances, of a far less strong and stubborn nature, and greatly more disposed to the raising of good and plentiful crops upon them. They are commonly much ameliorated and improved at first by growing beans, tares, and rape in succession with wheat and other suitable sorts of grain, having the green crops so managed as to stand as close, thick, and smothering as possible on the land. See **LAND** and **SOIL**.

TILMUS, *τῆλαμος*, a term used by some of the medical writers to express the effect of a sort of delirium, in which people pull the bed-cloaths, or pick out threads from the sheets. This is usually esteemed a dangerous symptom.

TILNOR, in *Geography*, a town of Bengal; 60 miles N.N.W. of Midnapour.

TILO-GRAMMUM, **OUGLI**, or *Ongli*, in *Ancient Geography*, a town of India, situated, according to Ptolemy, to the right of the most western arm of the Ganges, about 23° lat.

TILOTAMA, a nymph celebrated for her beauty in the mythological and amatory poems of the Hindoos. She appears to have been one of that numerous class of females, who, under the name of Upfara, arose from the churned

ocean, as described under our article **KURMAVATARA**: a fable as prolific of poetical incident, and as often referred to, as any in the whole range of invention. The chief of these Upfaras, or water-nymphs, was Rhenba, of whom some mention is made under her name in this work. They are described in numerous Hindoo poems with all the warmth and fancy that may be predicated of "youthful poets when they love;" and in terms too glowing for readers beyond the tropics. Under the name of another of these beautiful damsels, **MENAKA**, we have said something of them. See also **UPSARA**.

The name of the elegant nymph, the subject of this article, occurs in an inscription on a copper-plate found in the Deccan, bearing date A.D. 1359. The inscription is given in the 9th volume of the Asiatic Researches, and records a grant for pious purposes. After much adulation of the mother of the royal donor, it is said that "by the charms of her graceful gaiety she obscured Tilotama."

TILOUTTAH, in *Geography*, a town of Hindoostan, in Bahar; 10 miles S.S.E. of Saferam. N. lat. 24° 48'. E. long. 84° 15'.

TILOX, in *Ancient Geography*, a promontory on the northern coast of the island of Corsica, between the mouth of the river Valerius and Cæsiæ Littus.

TILPHOSSÆUM, a small country of Greece, in Thessaly.

TILSIT, in *Geography*, a town of Prussia, in the Lithuanian department, large, rich, and commercial. It obtained the privileges of a city in the year 1552, though the castle is said to have been standing so early as 1289. The river Memel, which runs along the N. side of the town, opens to it a very advantageous trade with Königsberg, in corn, linseed, butter, and other provisions. Tilsit, properly so called, consists of two long streets, of a proportionate breadth, which are called the German-street and the High-street, contiguous to which are the suburbs called the "Liberty." The number of houses in this city is about 600, and the inhabitants amount to 7000 souls. The ecclesiastical buildings are an evangelic or Lutheran German church, a Lithuanian church, and a Calvinist or reformed church. Without the town is a Lutheran chapel, and about an English mile from it a Roman Catholic chapel. The flat country about Tilsit, which is about 16 miles in length, and as many in breadth, is one of the most fertile spots in the whole kingdom: the inhabitants of it breed great numbers of horned cattle, and furnish not only Prussia, but likewise other provinces, with excellent butter and cheese; and the fisheries in this place are also considerable. The horses are large and strong, but clumsy. Barley is almost the only grain sown in these parts, which afford little or no wood. The marsh-land is, in spring, exposed to inundations by the overflowing of the rivers, which often do great damage. In 1807, it was taken by the French; soon after which a peace was made between France, Russia, and Prussia, called the "Peace of Tilsit; 50 miles N.E. of Königsberg. N. lat. 55° 8'. E. long. 22° 8'.

TILT. See **TOURNAMENT**.

TILT, in *Rural Economy*, a term signifying the arched or other covering of a cart, waggon, or other carriage.

The hoops for supporting the tilts in these cases, may be fastened upon the sides of the carriage-frames, after being properly prepared and bent in a sort of half-circular manner, in several different ways, but the fastening by means of screws is probably the best, where they are to remain fixed.

TILT-Boat, a boat covered with a tilt, *i. e.* a cloth, or tarpawling, sustained by bails or hoops over the stern, for

the sheltering of passengers. Such are some of those which carry passengers between London and Gravesend.

TILT-Hammer, is a large and heavy hammer, adapted to be put in rapid motion by the power of a water-wheel or steam-engine.

The tilt-hammer is distinguished from the lift-hammer, or forge-hammer, by the manner in which it is lifted up by the cogs of a wheel which is turned by the mill.

The forge-hammer is mounted on a centre of motion at the extremity of the haft or helve of the hammer opposite to the head of the hammer, and the cogs of the wheel operate beneath the helve near the head, to lift or toss up the hammer against a strong wooden spring called the rabbit, which is firmly fixed over the head of the hammer. This spring reflects the hammer down upon the anvil with greater force and smartness than the hammer would descend by the action of gravity alone. A lift forge-hammer is described under the article IRON. See *Plate IV. Iron Manufacture*.

The tilt-hammer is poised on pivots or a centre of motion, which is about the middle of the length of the helve, or sometimes at two-thirds from the head. The cogs of the wheel are made to act on the tail of the helve beyond the centre of motion, and they press down the end of the tail, and thus cause a correspondent elevation of the head of the hammer. Sometimes the spring is placed over the head of the hammer, the same as a lift-hammer; but more commonly, the tail of the hammer is made to strike against a fixed floor; and when the head of the hammer is thrown up suddenly, the momentum given to it causes the head to rise up after the tail strikes the floor, and thus bends the helve, which by its elasticity causes the head of the hammer to descend smartly upon the anvil.

The *tilt-mills* in the neighbourhood of Sheffield are very simple: they are worked by a small water-wheel, upon the axis of which is a wheel with a great number of cogs, fixed in its circumference. These successively depress the tail of the hammer, and raise its head: the hammer falls by its own weight, aided by the spring of the helve, upon the hot metal. The size of the water-wheel, and the number of cogs in the wheel, are adapted to produce from three hundred to four hundred strokes *per* minute.

This great number requires the water-wheel to move with a velocity which is inconsistent with the best mode of applying the fall of water, because it is well known that water, as well as any other heavy body, can only descend with a certain speed. If, therefore, the floats of the wheel are required to turn with a great rapidity, it is evident the proportion of work the wheel will perform, will be but small in proportion to the quantity of water expended. For this reason, it is found to be a great improvement in tilt-mills to add cog-wheels which will give the hammers a sufficient velocity, while the water-wheel turns at such a rate as is found to produce the greatest power from a given quantity of water.

A capital mill of this kind is delineated in *Plate VIII. Iron Manufacture*. It was made at the Carron iron-works in Scotland, after designs of the celebrated Mr. Smeaton. It is adapted for forging iron into bars, and has three tilt-hammers of different powers for different kinds of work. These hammers are not made to strike so quick as is usual in the Sheffield mills for the tilting and drawing out steel bars; but by giving a greater number of cogs to the wheels, the requisite rapidity may be obtained without increasing the speed of the water-wheel. A capital mill was built at Sheffield about six years ago, which is on Mr. Smeaton's plan, except in the proportions of the wheels, and its performance is superior to any of the other tilt-mills.

A A, in the plan *fig. 1.* are the walls of the building; B B the great water-wheel, which is of the kind called a breast-wheel. (See *WATER-Wheel*.) It is 18 feet diameter and 5 feet broad. The total descent of the water which actuates it is 7 feet 2 inches, and it falls upon the float-boards rather below the centre of the wheel, being retained against the floats by what is called the breasting, that is, a sweep or curved wall of masonry, which is accurately adapted to the float-boards of the wheel, and as close to them as is possible, to avoid touching.

The axis C of the water-wheel is carried through the wall A, and on the extreme end of it is a large iron wheel D, of 90 wooden teeth, 9 feet 6 inches diameter. This turns a pinion E of 30 teeth, and 3 feet 2 inches diameter. The pinion is fixed on one end of a cast-iron axis G G, which is made very large, for strength, and hollow within, like a pipe. The gudgeons *b* and G are fixed into it at each end, and upon these gudgeons it revolves. F F is a cast-iron fly-wheel, fixed on the axis close to the pinion; it is 12 feet diameter, and the rim 6 inches by 5. The weight is very considerable, and gives it a momentum to regulate the motion of the whole mill, and equalize all irregularities which arise from the successive actions of the mill to raise the three hammers, L, M, and N.

Each hammer has a separate cog-wheel, K, I, and H, to give it motion, which is effected by the cogs of these wheels acting upon the tails of the hammers and pressing them down. This is explained by the elevation *fig. 2.* where *e* is the iron head of the hammer, *f* its centre of motion, and *d* the tail or extreme end, upon which the cogs of the wheel act, and which is plated with iron on the upper side, to prevent it from wearing.

P is the anvil-block, which must be placed on a very firm foundation, to resist the incessant shocks to which it is subjected: the centre, *f*, or axis of the hammer, is supported in a cast-iron frame, *g b*, called the *hirst*. When the cogs of the wheel strike the tail of the hammer suddenly down, and raise the head, the lower side of the tail of the hammer strikes upon a support *n*, which acts to stop the ascent of the head of the hammer *e*, when it arrives at the desired height; but as the hammer is thrown up with a considerable velocity as well as force, the effort of the head *e* to continue its motion, after the tail strikes the stop *n*, acts to bend the helve L of the hammer, and the elasticity of the helve recoils the hammer down upon the anvil with a redoubled force and velocity to that which it would acquire from the action of gravity alone.

To obtain this action of recoil, the *hirst g b* must be held down as firmly as possible; and for this purpose, four strong iron bolts are carried down from the four angles of the bottom plate *b*, and made fast to the solid basis of stone R R, upon which the whole rests: upon this basis are placed four layers of timbers, *i, k, l, m*, which are laid one upon another, and the timbers of each layer are laid cross-ways over the others. Each layer consists of several pieces laid side by side, and they are slightly treenailed together, to form a platform. Each platform is rather less than that upon which it rests, so as to form a pillar of solid timber; on the top of which the *hirst-frame g b* is placed, and firmly held down by the four bolts, which descend through all the platforms, and have secure fastenings in the solid masonry beneath.

The stop *n* is supported by a similar pillar, but smaller, and composed of three layers: the upper piece *n*, which is seen crossways in *fig. 2.* is about three feet long, and the under side is hollowed, so that the piece bears only upon the two ends, leaving a vacancy beneath it, which occasions

it to bend or spring every time the tail *d* of the hammer strikes upon it, and this aids the recoiling action very much.

The axis on which the hammer moves is formed by a ring of cast-iron, through which the helve of the hammer is put, and held fast by wedging round it. The ring has a projecting trunnion on each side, ending in an obtuse conical point, which is received in a socket firmly fixed in the hirst-frame *g h* by screws and wedges, one of which is seen at *r*. These two sockets are thus capable of adjustment, so as to make the hammer face fall flat upon the anvil. The three wheels K, I, H, are of different sizes and numbers of cogs to produce that velocity in each hammer which is best adapted for the work it is to perform: thus, the wheel K for the great hammer has eight cogs, and therefore produces eight blows of the hammer for each revolution of the fly-wheel; the wheel I for the middle hammer has twelve cogs; and the wheel H for the small hammer sixteen; the latter will therefore make two strokes for every one of the great hammer. In fixing the three wheels upon the great shaft G H, care is taken that they shall produce the blows of the different hammers in a regular succession, and equalize as much as possible the force which the water-wheel must exert. The wheels are fixed upon the shaft by means of a wedging of hard wood, driven in all round; the wood, being capable of yielding a little to the shocks occasioned by the cogs meeting the tails of the hammers, renders the concussions less violent.

The following are the principal dimensions:

The head of the great hammer, P, weighs $3\frac{1}{4}$ cwt., and it is intended to make 150 blows *per* minute: it is lifted 17 inches from the anvil at every blow.

The middle hammer, M, is 2 cwt., and makes 225 blows *per* minute: it is lifted 14 inches each time.

The small hammer, N, weighs $1\frac{1}{2}$ cwt., and makes 300 blows *per* minute: it is lifted only 12 inches.

To produce these velocities, the great axis G must make $18\frac{3}{4}$ turns *per* minute; and the cog-wheels E and D, being in the proportion of one to three, the water-wheel must make $6\frac{1}{4}$ revolutions *per* minute; the water-wheel being 18 feet diameter, its circumference will be $18 \times 3.1416 = 56.54$, or $56\frac{1}{2}$ feet: this multiplied by 6.25 is about 353 feet motion *per* minute, or divided by 60 = 5.9 feet motion *per* second for the circumference of the water-wheel.

The tilt-mills employed in the manufacture of steel, do not have the great hammer P, but the largest they use is about the size of that at M, and is adapted for welding faggots of steel to make shear steel: the other two hammers are about the size of N, and are made to work much quicker, *viz.* from 350 to 400 blows *per* minute. This is very easily accomplished by making the wheels E and F as 1 to 4, instead of 1 to 3, as shewn in the drawing.

TILTH, in *Agriculture*, a term used to signify the condition of the earth or soil after the land has been ploughed and broken down by the harrow or other tool of the same kind; or the state and circumstances of the ground in regard to tillage, or heat, as relating to manure. Thus we have a *good* and *bad* tilth, as well as land *in* and *out* of tilth, in works on agriculture.

TILTIL, in *Geography*, a town of Chili; 30 miles S.E. of Valparayso.

TILTING of Steel; the process by which blistered steel, or steel in the raw state, is rendered ductile and fit for the purposes of various manufactures. Tilting consists in hammering or forging the steel by a large hammer called a *tilt*. See **TILT-Hammer**.

Steel is formed by two processes: one in which it is made at once from pig or crude iron in the finery, nearly in

the same manner as making bar-iron: this is called natural steel. In the second process, malleable iron, in bars, is imbedded in charcoal or other carbonaceous matter, and exposed to a considerable heat, till the carbon is thought to have penetrated sufficiently into the iron to have changed it into steel. This is called converting the iron by cementation with charcoal; and the furnace in which the operation is performed is called a converting furnace.

The object of this process of cementation, is to impregnate the iron with a certain quantity of carbon, to be derived from the charcoal: like many other simple operations, it requires great care and nicety to perform it properly, when put in practice on a large scale. The iron must be exposed to the action of an intense heat in contact with carbon (but defended from the access of oxygen), until the iron imbibes a portion of carbon and becomes steel.

The quantity of carbon which must be combined with iron to produce steel, admits of considerable latitude, and the qualities of the steel vary in the same proportion: with too little carbon, steel will be soft; and not sufficiently hard when it has been suddenly cooled by plunging in water. It has a rough and somewhat fibrous fracture, and in general may be said to possess many of the qualities of malleable iron. On the other hand, in proportion as the quantity of carbon is diminished, an over-cemented steel, containing an excess of carbon, is brittle, easily fusible, excessively hard after being suddenly cooled, and is liable to crack on the sudden change of temperature from hot to cold. All these properties are an approach to crude iron.

The received opinion respecting steel and the best cast-iron is, that they have the same constituent parts, but in different proportions; the former containing a smaller proportion of carbon than the latter. All the crude or cast-iron of commerce contains oxygen in greater or less proportion, but the best steel is supposed to be nearly free from this. Mr. David Musket, whose great practical and theoretical knowledge entitles his opinion to the greatest respect, supposes that the carbon contained in cast-iron and in steel, exists in very different states; and that steel is a combination of iron with pure carbon, similar to the diamond, but that crude iron, is iron containing the oxyd of carbon, which is charcoal. This opinion he founded upon the result of a very numerous series of experiments, many of which he communicated to the Philosophical Magazine, vol. xiii. He found that a piece of Swedish bar-iron, weighing 885 grains, introduced into a Stourbridge clay crucible, and half its weight (442 grains) of charcoal well prepared; a clay cover, fitting exactly, being placed on, and the whole exposed to a moderate heat for half an hour; that the result was, a perfect button of super-carbonated crude iron, weighing 928 grains, which therefore had gained $\frac{1}{7}$ th on its original weight; while the charcoal, which remained in the crucible in an intensely black state, weighed 290 grains, having lost 34.4 *per cent.* of its original weight.

In a second experiment, made in a similar manner, but with only a quarter of the charcoal, the iron gained $\frac{1}{19\frac{1}{10}}$ of its original weight, and the loss in charcoal was 45 *per cent.*: the metal was richly carbonated. When one-sixth of charcoal was used, the iron produced, resembled the produce of No. 1. and 2. of the crude iron of commerce; its weight was increased $\frac{1}{20\frac{3}{4}}$; and 57 *per cent.* of the charcoal disappeared in the process.

With one-eighth of charcoal, the iron gained $\frac{1}{22\frac{1}{10}}$ of its original

TILTING OF STEEL.

original weight; and the weight of the charcoal which disappeared was $67\frac{2}{5}$ per cent. The metallic button was very highly carbonated, and apparently formed an entire mass of carburet.

One-ninth of charcoal produced a super-carbonated button of crude iron, rather inferior to the preceding in point of carbonization: its surface was smooth, and of a dull lead-colour, entirely free from the usual shining specks of carburet, which very rich crude iron contains upon its surface. It had gained equal to $\frac{1}{2}$ th in weight by the fusion; and the loss in charcoal was 80 per cent.

When treated in the same manner with $\frac{1}{12}$ th of its weight of charcoal, the iron gained weight equal to $\frac{1}{27}$ parts: and 83.5 per cent. of the charcoal disappeared in the process. The metallic button possessed the usual smooth surface, partially covered with carburet.

One-fifteenth part of charcoal, exposed with the iron to a heat sufficient to melt it, was all lost; the metal gained $\frac{1}{30}$ th in weight, which was exactly half the weight of charcoal lost. The surface of the button was not carbonated, as the foregoing experiments: the colour was blueish-black, smooth in the centre, but a little oxidated towards the edges. The fracture was that of close dark-grey crude iron; the crystals much closer and more minute than in the preceding experiments. Its quality was such as manufacturers term No. 2. grey melting pig-iron.

When only $\frac{1}{20}$ th part of charcoal was employed, none of which remained after the fusion, the iron gained $\frac{1}{33}$ parts in weight: a small portion of amber-coloured glass was found round the edges of the button. The fracture of the metal was smooth silvery-white, occasionally studded with carbonaceous specks in form of small grains: it exactly resembled mottled pig-iron.

With $\frac{1}{25}$ th part of charcoal, the metal gained $\frac{1}{37}$ parts in weight, the whole of the charcoal disappearing. The upper surface of the button was smooth, but the under considerably pitted. The concaves were chequered with the rude crystallization peculiar to cast-iron. Its fracture was bright silvery-white, destitute of grain, and exhibiting a very perfect streaky crystallization slightly radiated: its resemblance was strikingly similar to that of highly-blown crude iron, prepared in the finery for making malleable iron.

A piece of Swedish iron was placed in $\frac{1}{30}$ th its weight of charcoal: the fusion of the mixture produced a metallic button weighing $\frac{1}{27}$ parts more than the iron employed, which increase is not quite a quarter of the loss in charcoal, which wholly disappeared in the experiment. The upper surface of the button was smooth without configuration, but the under surface was uneven, and covered with minute but perfect crystallization: its fracture was blueish silvery-white, composed of flat dazzling crystals, proceeding in lines from a centre to the edges of the button. Here it was evident, that from the small proportion of carbon combined with the iron, it was found to assume the earliest stage of granulation approaching to the state of steel. The brilliant concretions observable in the surface of the button were too indistinct and flat for steel capable of bearing the hammer.

When the proportion of the charcoal was reduced to $\frac{1}{30}$ th of the iron, its consequent increase was but $\frac{1}{30}$ th part. The upper surface of the button was smooth, with a faint impression of a chequered crystallization: the under surface possessed some large pits similarly though more perfectly crystallized; the fracture was one shade of blue beyond the last experiment. A regular granulated surface, composed of flat oblong crystals, was observable, still too indistinct and too much on edge for workable steel.

With only $\frac{1}{34}$ th of the weight of charcoal, the button was deficient $\frac{1}{34}$ th part of its weight originally used, yet

the whole of the charcoal was lost. The surfaces of this button were uniformly smooth; the fracture dense, and displaying a grain peculiar to highly saturated blistered steel. When put under the hammer with a low red heat, it withstood a few blows, but afterwards parted.

Charcoal $\frac{1}{30}$: the metallic button weighed $\frac{1}{31\frac{2}{5}}$ less than

the iron employed. Its surface was wavy and crystallized: the under surface was rough, and contained one large pit accurately crystallized: the fracture was regularly granulated, small but distinct, and of a light blueish colour. The crystals, though distinct, were not so prominent as those of easy drawing cast-steel; it however hammered with the usual degree of caution necessary in the working of cast-steel. The bar of steel formed from the button was very proper for file-making, and other purposes requiring highly converted steel.

The proportion was reduced to $\frac{1}{40}$ th part the weight of iron: the produce was $\frac{1}{22\frac{1}{5}}$ less than the original weight

of iron. The surface of the button was smooth, without crystals: the under surface rough, and possessed of one large pit in the centre, faintly marked with the usual crystalline appearance. The fracture presented regular light-blue grains, distinct and more prominent than in the last experiment. One half of this button was drawn into a neat square bar, and proved excellent steel. One end of it, being loose and shaled, welded tolerably well, and hardened afterwards with a low heat. From its quality, it seemed adapted for manufacturing penknives, razors, &c. possessing neither the extremes of hardness nor softness.

Mr. Musket continued this series of experiments till the proportion of charcoal became so small as $\frac{1}{50}$ th part; and he gives the following conclusions, deduced from the results,

	Parts by Weight.
Iron semi-steelified is made with charcoal	$\frac{1}{15}$
Soft cast-steel, capable of welding, with	$\frac{1}{15}$
Cast-steel for common purposes, with	$\frac{1}{20}$
Cast-steel requiring more hardness, with	$\frac{1}{25}$
Steel capable of standing a few blows but quite unfit for drawing,	} $\frac{1}{30}$
The first approach to a steely granulated fracture, is from	} $\frac{1}{30}$ to $\frac{1}{40}$
White cast-iron	$\frac{1}{5}$
Mottled crude iron	$\frac{1}{10}$
Carbonated crude iron	$\frac{1}{15}$
Super-carbonated crude iron	$\frac{1}{20}$ or

when any greater quantity is combined with it.

In the above experiments it will be seen, that when more than $\frac{1}{30}$ th part of charcoal is employed, the weight of the produce is increased; but when less than $\frac{1}{30}$ th part is used, a loss is experienced proportioned to the diminution of the carbon. The increase of weight in the iron is by no means equal to the loss in the charcoal, never exceeding the half thereof; but this is accounted for in other experiments made by Mr. Musket, where charcoal was found to be transmitted through close crucibles in a high degree of heat.

The French chemists made a direct experiment to prove that the diamond is really carbon in a crystallized state. By inclosing a small diamond in a piece of malleable iron, and melting this in a close crucible, it was found to be converted into steel, and the diamond had disappeared.

The manufacture of *natural steel* is carried on in Germany, and Swedenborgius gives us the following account of the method used in Dalecarlia for making steel from cast-iron.

The

TILTING OF STEEL.

The ore from which the crude iron to be converted into steel is obtained, is of a good kind; it is black, friable, and composed of many small grains: it produces very tough iron. The conversion into steel is made upon a forge-hearth, something smaller than that commonly used for converting cast-iron into malleable iron: the sides and bottom are made of cast-iron; the tuire is placed with very little inclination on one of the side-plates; the breadth of the fire-place is fourteen inches, its length is greater; the lower part of the tuire is six inches and a half above the bottom: in the interior part of the fire-place, there is an oblong opening for the flowing of the superfluous scoria.

The workmen first put scoria on the bottom, then charcoal and powder of charcoal, and upon these the cast-iron, run or cut into small pieces. They cover the iron with more charcoal, and excite the fire. When the pieces of iron are of a red white, and before they begin to melt, they stop the bellows, and carry the mass under a large hammer, where they break it into pieces of three or four pounds each: the pieces are again brought to the hearth, and laid within reach of the workman, who plunges some of them into the fire and covers them with coal. The bellows are made to blow slowly till the iron is liquefied, when the fire is increased; and when the fusion has been long enough continued, the scoria is allowed to flow out, and at that time the iron hardens. The workman adds more of the piece of crude iron, which he treats in the same manner, and so on a third and fourth time, till he obtains a mass of steel of about a hundred pounds, which is generally done in about four hours. This mass is carried to the hammer, where it is forged and cut into four pieces, which are further beat into square bars four or five feet long. When the steel is thus forged, it is thrown into water, that it may be easily broken, for it is yet crude and coarse-grained. The steel is then broken in pieces, and carried to another hearth, similar to the former. These pieces are laid regularly in the fire-place, first two parallel, upon which seven or eight others are placed across; then a third row across the second in such a manner, that there is a space left between those of the same row: the whole is then covered with charcoal, and the fire is excited. In about half or three quarters of an hour the pieces are made hot enough, and are then taken from the fire one by one, to the hammer, to be forged into little bars from half a foot to two feet long, and while hot, are thrown into water to be hardened. Of these pieces, sixteen or twenty are put together, so as to make a bundle, which is heated and welded, and afterwards forged into bars four inches thick, which are then broken into pieces of convenient length for use.

Converting of Steel by Cementation with Charcoal.—The quality of steel is intimately connected with that of the iron from which it is converted, and the iron made in Sweden is esteemed the best for the purposes of cementation. This process is almost wholly in the hands of the English, who pay a higher price for the iron, and by that means secure nearly all the iron of Roslagia, which is the best iron of Sweden.

The best marks of Swedish iron are: that called the hoop L, which is denoted by a circle, with an L in the centre;

thus, : the GL; thus, : the double bullets;

thus, . The iron of these three marks bears nearly the same price, which is sometimes as high as 40*l.* per ton.

There are also the Swedish marks; as PL, : the hoop

S, : and the gridiron, ; which are worth a few pounds per ton less than the former; viz. from 34*l.* to 38*l.*, when the best marks are 40*l.*

The Russian marks are, first, that called the CCND: the mark is six Russian letters, CHEHPB, worth about 37*l.* per ton, when the others are at 40*l.*: and the P S I, which is marked by the Russian letters P S I, is so inferior, as to sell for only 26*l.* or 27*l.*

It is to be lamented that, in the present state of our iron manufacture, we are unable to produce malleable iron which is equally fit for converting into steel with the Russian and Swedish iron. The general opinion upon this deficiency is, that it arises from some superiority in the foreign ores of iron, but more immediately from the circumstance of their using charcoal of wood instead of the coke of pit-coal in smelting or reviving them; and some of our manufacturers do not hesitate to assert, that they can make iron with charcoal equal to the foreign in quality; but that in respect to price, the circumstances of this country will not allow them to cope with those countries, where the destruction of wood is in some measure considered as beneficial, by clearing the land for the operations of husbandry.

The Swedish and Russian iron is imported into this country by iron merchants in immense quantities together, this trade being in the hands of a few individuals: by them it is retailed in smaller portions to the converters, whose furnaces are chiefly about Sheffield and at Newcastle, who, after cementation, dispose of the greater part of it to the manufacturers of steel goods in the state of blistered bars. Its value is estimated by the Swedish or Russian marks of iron, which still remain upon the bars. The manufacturers send their bars to the tilt-mills, where they are made into common steel and shear or German steel, or they melt it to form cast-steel.

The conversion of iron into steel is performed in a furnace, hence called a converting furnace. The external building is a large and tall cone, similar to a glass-house, within which, one or two large crucibles, called pots, are placed, and surrounded by flues in a manner best calculated to communicate a constant and regular heat to every part of them. In these pots the iron bars are placed, being stratified in pulverized charcoal, and the pots are covered over with sand to exclude the external air.

A more perfect idea of the converting furnace will be had by referring to *Plate VII. of Iron Manufacture*, which contains a horizontal plan and two vertical sections of one of the furnaces used in the neighbourhood of Sheffield, with two pots for containing the iron. In all the figures, the same letters of reference denote the same parts. CC is the external cone, built of brick or stone work; its diameter at the base varies in different furnaces, according to the size of the pots it contains: its extreme height from the ground to its vertex should not be less than forty or fifty feet to cause a proper draught. To create a sufficient heat for the process, the top of the cone usually terminates with a cylindrical chimney of some feet in height. The conical form of the external building is by no means essential; any form will operate in the same manner, if it is of a proper height: some are in practice built nearly in the shape of the small end of an egg, with a round chimney upon the top. The lower part of the cone is built square or octangular, as is the plan of *fig. 3.* The sides are carried up until they meet the cone, giving the furnace the appearance of a cone cut to a square or octangular prism at its base, and exhibiting the parabola where every side intersects the cone.

The conical building contains within it a smaller furnace, called

TILTING OF STEEL.

called the vault, built of fire-brick or stone, which will withstand the action of a most intense heat, without cracking or vitrification. D D in the section is the dome of the vault, and E E its upright sides, the space between which, and the wall of the external building, is filled up with rubbish and sand. The vault, as is shewn in the plan, is always four-sided, that it may contain the pots which receive the iron bars to be converted. A B represent the two pots, built of fire-stone, each ten feet long, three feet deep, and two feet nine inches wide; the space between them is twelve inches wide; and directly beneath it is the fire-grate. The pots are supported by a number of detached courses of fire-brick, as shewn at *ee* (fig. 1.) which leave spaces between them, called flues, to conduct the flame under the pots: in the same manner, the sides of the pots are supported from the vertical walls of the vault, and from each other, by a few detached stones, (*f*, fig. 1.) placed so that they may intercept as little as possible of the heat from the contents of the pots. The adjacent sides of the pots are supported from one another by small piers of stone-work, which are also perforated, as shewn at *d* (fig. 2.) to give passage to the flame. The bottoms of the pots are built of a double course of brick-work, about six inches thick; the sides nearest together are built of a single course of stone, about five inches in thickness; and the other parts of the pots are single courses about three inches, the sides not requiring so much strength, because they have less heat and pressure to resist.

The vault has ten flues or short chimneys, F F, rising from it; two on each side, to carry off the smoke into the great cone, shewn in the plan 3, communicating with each side, and two at each end.

In the front of the furnace, at H, an aperture is made through the external building, and another corresponding in the wall of the vault: these openings form the door, at which a man enters the vault to put in or take out the iron: but when the furnace is lighted, these doors are closed by fire-bricks luted with fire-clay. Each pot has also small openings in its end, through which the ends of two or three of the bars are left projecting in such a manner, that by only removing one loose brick from the external building, the bars can be drawn out without disturbing the process, to examine the progress of the conversion from time to time: these are called the tap-holes; they should be placed in the centre of the pots, that a fair and equitable judgment may be formed from their result of the rest of its contents.

ab, in the elevation, is the fire-grate, formed of bars laid over the ash-pit I, which must have a free communication with the open air, that it may convey a current of fresh air to supply the combustion. The ash-pit should also have steps down to it, that the attendant to the furnace may get down to examine by the light, whether the fire upon the whole length of the grate is equally fierce; and if any part appear dull, he uses a long iron hook to thrust up between the bars and open a passage for the air. The fire-place is open at both ends, and has no doors. The fire-grate is laid nearly on a level with the floor of the warehouse, before the furnace, and the fireman always keeps a heap of coals piled up before the apertures at its ends, so as to close the opening. This forms a very simple and effective door; and when the furnace requires a fresh supply of fuel, a portion of the heap of coals is shoved in by a sort of hoe, and the heap renewed, to stop any air from entering into the furnace, except that which has passed upwards through the ignited fuel, and by that means contributed to the combustion.

The fire-stones that compose all those parts of the furnace which are exposed to the action of the heat, are first hewn nearly to size, and finished by grinding two surfaces together, so that they make very perfect and close joints:

when laid together, they are cemented with well-tempered fire-clay, mixed up very thin with water. The fire-clay which answers best for this purpose, is that brought from Stourbridge, in Staffordshire, and is the same of which the celebrated Stourbridge crucibles are composed; but very good fire-clay for the purpose is procured from Birkin-lane, near Chesterfield. When the furnace has been once burnt, this clay becomes equally hard with the stone, and is less liable to fly or vitrify in an intense heat, than any other known cement.

The process of charging the furnace with iron for conversion is conducted as follows. The bars of iron are first cut to the length of the pot; and for this purpose an anvil is placed at such a distance from the wall of the building, that the distance from the edge of a cold chisel wedged into the eye of the anvil, to the wall, will be just the length of the pots. One workman places the end of a bar against the wall, and lays the other end across the edge of the chisel, whilst another with a sledge-hammer strikes upon the bar till it is cut half through; then it is turned the other side upwards; and the end cut completely off. By this gauge the bars are all cut to one length, and a man enters through the door in the vault, to dispose of them in the pots: he is provided with a basket of fine pulverized charcoal, a sieve, and a shovel. An iron plate is put into the furnace, and lays over the space between the two pots to form the floor, upon which the man stands while at work. He commences his operations by sifting a layer of charcoal over the bottom of the pot, about half an inch thick, and he is careful in using the sieve to lay the charcoal of an even thickness in every part; but if it should not be carefully done, he levels it with the shovel. The workman on the outside now introduces the bars into the furnace through a hole, made by taking out a brick in the wall, just over the end of one of the pots, and the workman within deposits them upon the stratum of charcoal in the bottom of the pot, arranging them parallel to each other, and leaving an interval of about an inch between each bar. When the bottom of the pot is in this manner covered with iron bars, charcoal is again sifted upon them, and levelled with the shovel, to fill up the intermediate spaces between the bars, and to cover them about an inch thick: another layer of bars is then introduced into the furnace, placed upon the charcoal, and in its turn covered over with a stratum of charcoal; and in this manner the pot is filled to within two inches of the top. A layer of the sand which is found in the bottom of grindstone troughs, is then spread three or four inches thick upon the whole, to cover the pots up close, and prevent the access of the common air and flame. In placing the successive layers of bars in the pot, it is proper that each should be laid over the space between two of the bars in the layer beneath, because each bar will then be surrounded by a greater thickness of charcoal, than it would if they were laid directly over each other. Two or three of the bars should be left somewhat longer than the rest, and their ends should project through the trial-holes in the ends of the pots, and sand rammed round them in the holes to keep out the air.

The pots being both filled and covered up with the sand and rammed down, the holes for introducing the bars are closed by a brick or fire-stone, and luted with fire-clay. The apertures through the outer wall opposite the ends of the trial-holes are also stopped and luted. The iron plate upon which the man stood is now removed, and the doors in the vault closed up by bricks set with fire-clay; next, the opening in the external building is shut up, and the furnace is charged ready for lighting.

The furnace is kindled by lighted wood placed on the fire-grate, then a few coals are thrown in, and when well lighted, the quantity is increased; the heat thus generated rarefies the air contained in the vault and in the great cone;

TILTING OF STEEL.

and being thus rendered of less specific gravity than the external air, it rises up in the cone, and a fresh supply rushes in through the bars of the grate, to restore the equilibrium. By going through the fire, this air parts with its oxygen, and excites the combustion, and becoming heated, rises up the chimney, and causes a very strong draught of air to enter the fire.

At first kindling, the fuel is supplied in small quantities, that the heat in the furnace may be gradually increased, and not endanger the cracking of the stones: in a few hours time the quantity of fuel is increased, so as to produce the full heat, which is to be maintained as equally as possible throughout the whole process. The fuel, which is pit-coal, is introduced at both ends of the grate, through small arches in the wall, which are in a line and on a level with the fire-grate, a quantity of coals being always left before the end of the arch to stop it up, and prevent any air getting into the furnace, without passing through the grate. Part of these coals is forced into the furnace, as before mentioned, when it requires a supply of fuel, which is generally at intervals of about half an hour each. The fireman frequently examines the appearance of the under side of the fire-grate, and judges from it the state of the fire: he improves it where necessary, as before described, by thrusting a hook up between the bars to make way for the air.

The flame arising from the ignited fuel upon the grate partly proceeds upwards between the pots, and heats them by that means; it then strikes the roof of the vault, and is reverberated down upon the pots, and escapes through the six flues or chimnies in the vault. The draught also draws the flame from the grate under the pots, and round the outside and ends. The principal object in this stage of the process, is to maintain the same degree of heat in every part of the pot, that every bar may be equally converted in the same space of time. The roof of the vault must be built of very good stone (none being better than from Roches quarry, in Ashover), to withstand the great heat exerted upon it: it is customary to build them very thin, and cover the outside with a small thickness of dry sand to keep them tight, in case of a stone cracking.

In this way the fire is kept up in as equable a manner as possible, until the iron is supposed to have imbibed a sufficient portion of carbon from the charcoal to render it fit for its intended purpose: in this circumstance, the manufacturer regulates his judgment by his experience of former processes. About the time that he supposes the conversion to be sufficiently advanced, one of the trial-bars is drawn out from the pot, and by comparing the size of the blisters raised upon its surface with another bar which is known to be sufficiently carbonated, an idea is formed of the state of the furnace, and accordingly the fire is, at the proper time, discontinued, and the furnace is suffered to cool. Some manufacturers proceed to make experiment of the trial-bar by hardening and tempering it, so as to prove to a certainty the degree of its conversion, the blisters being found in some degree fallacious; for their size depends as much upon the degree of heat to which the bar has been exposed, as upon its carbonization, and shew the rapidity with which the conversion has been carried on, rather than its actual state.

The time which the iron is required to be in the process of cementation depends upon a variety of concurring circumstances. 1. The degree of carbonization required to form a steel of the proper quality; this varies with the use the steel is to be applied to. 2. The heat it is subjected to. 3. The nature of the iron employed in the process. The combinations of these circumstances are so numerous, that nothing but long experience can determine the proper duration of the process.

In general terms it may be observed, that a short period will produce a steel very soft and tenacious, which, when properly treated, will possess elasticity as its most striking property, and is therefore very proper for springs, wire-drawing, and other purposes requiring ductility, but without the hardness requisite for edge-tools. The period of cementation for such steel varies in different manufactories, from four to six days and nights.

Steel which requires more hardness, but at the same time sufficient tenacity to resist sudden shocks, such as the edge-tools for working wood are subject to, must be cemented a longer time. This, which is mostly tilted into shear steel, is cemented six, seven, or eight days, according to the heat and the quality of iron employed. The steel employed for fabricating tools for cutting metals and hard substances being but small in demand compared with the others, is not cemented a longer time, but is returned into the furnace at the next charge, along with a charge of iron, and cemented again with fresh charcoal: this is termed double converted steel. But for some few purposes, such as the turning and boring of cast-iron, the steel is converted three times: in this state it becomes so hard and brittle as to be totally unfit for any purpose requiring tenacity, or for any cutting edge which is less than an angle of 70 degrees, or it would be continually breaking.

The heat which is requisite for the process, must be as great as to give the iron nearly a welding heat, but if carried farther, will endanger melting the bars when the process has proceeded some time; an accident which has frequently occurred through the inattention of the fireman. It is observed by manufacturers, that the carbonization proceeds quicker when the heat is greatest, and for this reason the duration of the process varies in different furnaces, in some measure from their construction, in urging a greater heat, and this depends chiefly upon the height of the chimney, and the draught it occasions.

When the conversion is supposed to be complete, the furnace is suffered to cool, until a man can conveniently enter the furnace, to take out the bars and remaining charcoal, and prepare the furnace for a new charge. The bars which are brought out are (from being covered with blisters upon the surface) termed blistered steel.

On examination of the fracture of a blistered bar, it is found full of internal cracks, which are generally parallel to the flat side of the bar: some of them are larger than others, and extend the parts of the bar sufficiently to raise numerous protuberances or blisters upon its surface. These cracks have every appearance of being opened by the expansive force of some gas generated in the iron during the process, but what the nature of this gas is, still remains to be investigated. It seems to arise from the body of the iron itself, by the crack being within the solid substance of the bar. The fracture of the blistered steel is exceedingly irregular, of a white colour, like frosted silver, and appears like an irregular crystallization; but the facets exhibited are larger in proportion as the cementation has been longer continued, and from this reason they are larger towards the surface of the bar than in its centre.

The furnace above described is of that kind which is esteemed the best for the process, and is most generally employed in and about the neighbourhood of Sheffield in Yorkshire, where the manufacture of steel is carried on in a larger scale than in any other part of England. The furnaces used at Newcastle, which is another seat of this trade, are very similar.

The charge consists of twelve tons, each pot containing six tons of iron; and it is necessary that all the bars converted

TILTING OF STEEL.

at one process be of the same size, or the smaller ones would be thoroughly converted before the others had taken up a sufficient dose of carbon. This large quantity of a single article is more than the trade of some manufacturers will dispose of, they therefore employ smaller furnaces, which contain only eight tons, and such are generally constructed but with one pot ten feet in length, three feet broad, and two feet deep: the fire-place is directly beneath the pot, twenty inches wide, and flues are carried round it on both sides and ends: the vault and chimney of such a furnace are the same as the double pot. It is found by experience that the small furnaces consume somewhat more fuel in proportion to the quantity of iron they convert, than the large ones, because the heat lost in the beginning and end of the process, and that transmitted through the walls of the building, is the same in both instances.

Mr. Daniel Little of America, in 1785, recommended a new substance to be used in the cementation of steel instead of charcoal: it is the marine plant known by the name of rock-wood, or rockware, and is found in great plenty on rocky shores in America. It was to be prepared by first mowing it from the rocks by the scythe or sickle, and spreading it out on dry land till the rains have washed off the greater part of the sea-salt; it was then to be dried and pulverized, and may be used as any other cement for making of steel. He says that he discovered this property in an experiment where a small piece of iron was put into a crucible, and filled with the powdered plant as a cement: after it had been exposed to little more than a cherry heat for five or six hours, it was converted into steel.

All cemented steel in its raw state, after it is taken from the converting furnace, is called blistered steel; because the surfaces of the bars are covered with blisters, and on breaking a bar it is found to be full of cavities within, which seem to have been opened by some gas generated in the iron when in the process of cementation, and to have raised the surface into blisters, which are hollow within. In this state the steel is not fit for any purpose, because of these numerous cavities, and from the great disposition it has to break with the most irregular and rugged fracture imaginable. To render it found and tenacious, it must be well hammered while at a moderate heat, which operation is termed *tilting the steel*, because it is done under the tilt-hammer, worked by machinery. There are many reasons why the hammering of steel cannot be sufficiently performed by hand: the principal are, that the expence of labour would be too great to answer, and that a man could not strike hard and quick enough, to complete the operation at one heat of the steel: if more than one heat is taken, the steel will not receive so much advantage from the hammering, because when it is heated, its pores are opened; and if suffered to cool without hammering, the grain of the steel will be found considerably coarser; therefore, every time it is heated, the good effects of the previous hammering are in a great measure lost. Tilt-hammers are worked by water-wheels or steam-engines, according to the local situation of the manufactory. (See a description in the article *TILT-Hammer*, Plate VIII. *Iron Manufacture*.) The same axis is made to actuate three or four tilt-hammers placed side by side, and the hammers are not all of equal lengths, each one being shorter than the next: by this arrangement, when they are all working together, the workman of one tilt does not incommode those employed at the other two. The anvils of the hammers are nearly on a level, or at most only a few inches above the surface of the ground; and the workman sits in a pit or fosse, dug for the purpose, in a direction perpendicular to the helve of the tilt, upon a seat which is suspended from the roof of the building by two

iron rods: by this means he can with the greatest ease advance to or from the hammer, by just touching the ground with his foot, and pushing himself backwards or forwards as he sits in the swing. The three seats are in parallel directions, but sufficiently distant from each other, in consequence of the different lengths of the hammers, to allow the workmen to perform their business. At a convenient distance from each tilt, is placed the forge for heating the steel. The two forges for the small hammers are placed together under the same dome, while the other forge is by itself near the great hammer. The bellows for the forges are worked by a small crank on the end of the gudgeon of the shaft; they are placed over-head in the roof of the building, and a copper pipe conveys the air to the true iron. The forges are like those used by smiths, except that they have a small cover built of fire-brick over the hearth: the cover is square within, about eight inches wide, eight high, and eighteen inches or two feet long. It is open in front, to introduce the bars. The coals are placed on the hearth, as smiths usually do, and the brick covers act, to reverberate the flame down upon the steel, and give a very regular heat. Each workman at the tilt is attended by two boys, who heat the steel at the forge, and convey it to the workman, that he may lose no time: another boy attends each tilt to take away the finished rods and cut them to length, and then to straighten them.

The operations of the tilt are conducted in the following manner: Suppose a piece of steel has been heated by one of the boys, and brought to the man at the hammer, he places it upon the anvil, at a part nearest to the centre of the hammer, where its surface is reduced to a round edge, about an inch wide: the face of the hammer is made round, to correspond with the anvil, and from its similarity to the edge of a smith's hammer, may be called the pen of the hammer and anvil. The machine is always in rapid motion, and between every stroke that the hammer makes, he moves the bar forwards on the anvil, that it may be struck by the edge of the hammer in a fresh place. If the bar is flat, as blistered steel usually is, it is first hammered in this manner upon its edge, to reduce it to a square, and at the same time draw it out in length. When it has been hammered thus all its length, the surface becomes indented on both sides by the edges of the hammer, the anvil being bounded by waving lines. This first operation is called *notching down*. The tilter then removes the bar beneath the flat face of the hammer, and the rod is flattened at every stroke, and all the indentation removed; when he gradually recedes from the hammer, drawing the rod along, and flattening it all the way. When the end of the rod comes under the hammer, he turns the other face of the rod upwards, and advancing to the hammer, pushes the rod forwards under it: in this manner he proceeds, flattening it on one side or the other, until he brings it to the proper size, which he tries by a gauge. The moment it is finished, the boy brings another piece of hot steel, which he places under the hammer, and then the other boy takes away the finished rod from the tilter, who takes the fresh piece: in doing this, they are careful that the hot piece of steel is placed under the hammer before the other is taken away, that the faces of the hammer and anvil may not strike together, when there would be danger of breaking them, as they are both made of cast-iron: the second piece is tilted in the same manner as before, and when finished, is changed for another.

The perfection of tilting steel, depends upon drawing out a rod perfectly straight to the same size in every part of its length. Many workmen, particularly at Sheffield, have acquired such skill and dexterity in the management of the rod while under the tilt, that their work is as straight and even

as though it had been drawn through a steel-plate, in the same manner as wire, and all its angles perfectly square: its surface is of a black polish, and as smooth as though it had been filed. All artists use the square steel rods for making their tools; and the straightness and regularity of the rods are such, that a person who has not been an eye-witness of the operation, would scarcely believe it possible to produce such accurate work from the blows of a hammer. The points to be attended to by a tilter are, that in notching down the bar to draw it out to length and size, he causes the blows to fall exactly at equal distances from each other, unless (which seldom happens) the bar should have any part thicker than the rest; the strokes must then be a little nearer together in that place, to reduce it all to one size. Afterwards, to flatten the bar, he must be careful to place the bar truly flat upon the anvil, and hold it in the same place, whilst he draws the bar under the hammer, and that he moves himself with a perfectly equable motion, that every part of the bar may be alike subjected to the action of the hammer: the surface will then be true, and free from undulations. Another circumstance to be attended to is, when he turns the bar upon the anvil to hammer the adjacent sides, that he makes them truly square to the former sides. These things must all be done in so little time, that it requires long practice and experience to perform them well. Beginners are always apt, when they place their feet on the ground, to move themselves too quick just at that time, which causes the bar to be thicker at that place.

The different methods of conducting the operation of tilting, give the steel different qualities, which are distinguished into 1. Common steel; 2. Shear or Newcastle steel, also called German steel; and 3. Tilted cast steel.

Common steel is made by tilting bars of blistered steel, and drawing them out into rods of any size. The blistered bars are of various sizes, but in general about an inch and a half broad by half an inch thick. If these are to be drawn into rods half an inch square, they are broken into convenient lengths to handle, and one end of each piece is heated to a good welding heat by the boy who attends the forge, who puts three or four in the fire together, and, according to their size, he learns by experience at what time he must put every one into the fire, that it may acquire the proper degree of heat by the time that the tilter shall have just finished the other bars.

The tilter first begins by notching down the narrow edge of the bar, holding the other end of it in his hand, and notches down such a length of it as experience teaches him will be sufficient to form a rod of the length and size required. The notching on the edge of the bar rather increases its thickness, while it diminishes its breadth, and brings it nearly to the square figure of a rod: he then flattens it, and begins again to notch it down upon the broad side; afterwards he again flattens it; then proceeds to notch it upon the edge, and afterwards to flatten it once or twice on both sides, and the rod is finished.

When a skilful tilter has been some hours at work upon rods of one size, he judges by sight when the rod is of the proper size; but on first beginning, he tries it by a gauge, and flattens it repeatedly, if necessary, the boy bringing a piece of hot steel to place under the hammer while he is gauging, and which is drawn out in its turn. When the tilting is completely finished, the steel rod is taken away by another boy, who, with a pair of shears, cuts off the rod from the blistered bar from which it was drawn out. He places the rod on a flat cast-iron table, and sets it truly straight by a hammer, then stamps the bar with a mark of the quality of the steel, and it is finished.

All these operations are performed in so short a time, that

the rod still retains a red heat; but this will excite less surprize when it is considered that the hammer strikes four hundred blows *per minute*, and falls with great weight, so that it soon completes the work, and it is very probable that the great percussion it exerts upon the steel in some measure preserves the heat. It is well known that blacksmiths are in the constant habit of lighting a match to kindle their fire, by only hammering a small piece of iron quickly, and turning it about under the hammer, and in a short time it acquires sufficient heat to inflame the sulphur of the match. This heat most probably arises from the friction which the hammer causes amongst the particles of the iron, by rubbing them violently against one another; and the smiths observe, that the iron will not become red-hot if it is always struck upon the same side; but it must be turned round, that a new surface may be continually exposed to the action of the hammer.

Shear steel is so called, because the shears for dressing woollen cloth are made of it. It is also called Newcastle steel, because formerly made there; and German steel, because the natural steel in Germany is treated in the same way; it is likewise called *faggotted steel*. To make shear steel, the bars of blistered steel are broken into lengths of about eighteen inches; then four or more of these are laid together with one of double the length, and all four are tied together with pieces of small steel: this is called a faggot, and is placed in the forge, to be heated to a good welding heat; it is then taken to the tilt, and notched down on both sides, to weld all the bars together, and close up the internal flaws. The workman holds the faggot by the end of the long bar as a handle: the operation of welding takes but a few seconds, and a small rod is then drawn out from a piece of the end, in the same manner as drawing out common steel.

Cast steel is prepared by melting fragments of blistered steel, and casting them into an ingot. (See STEEL.) The ingot is then drawn out under the tilt into the required size, and the manner of doing this is the same as for common steel.

It is the custom of the manufacturers of cutlery and steel goods to purchase steel from the converting furnaces in the state of blistered bars, which they send to the tilt-mills to be drawn out to the size they require for their use: this is done at regular prices. In tilting steel, a trifling loss is sustained by the metal oxydating upon the surface, and throwing off black scales. The manufacturers are in the habit of allowing 4.6 to 8 lbs. *per* hundred weight for such loss: this latitude is given, because in drawing the bars out into rods of a small size, the waste must necessarily be greater; the metal being much longer exposed to oxydation, and the surface throwing off more scales.

TILUTHA, in *Ancient Geography*, an island of Asia, in the Euphrates, about 33° 55' lat.

TILWARAH, in *Geography*, a town of Hindooostan, in Gurry Mundella; 5 miles S. of Gurrak.

TIMACUM, in *Ancient Geography*, a town placed by Ptolemy in Upper Mœsia, at a distance from the Danube.

TIMÆA, a town of Asia, in the interior of Bithynia. Ptol.

TIMÆUS, the *Locrian*, in *Biography*, was a philosopher of the Italic school, and flourished in the time of Plato, who derived from him principally the doctrine of Pythagoras, and whose book, entitled "*Timæus*," was

founded on his book "On the Nature of Things." Proclus preserved a small treatise of Timæus "On the Soul of the World," and it is prefixed to some editions of Plato's Timæus. In this treatise, chiefly Pythagorean, he differs from Pythagoras in the following particulars: *viz.* that, instead of one whole, or monad, he supposes two independent causes of nature, God and Mind, the source of intelligent nature, and Necessity or Matter, the original of bodies; and that he explains the cause of the formation of the world, from the external action of God upon matter, after the pattern or ideas existing in his own mind. Upon a comparison of this piece with Plato's Timæus, it will be found that the Athenian philosopher has obscured the simple doctrine of the Locrian with fancies drawn from his own imagination, or from the Egyptian schools.

In the time of Ptolemy Philadelphus there was a Sicilian, named Timæus, who was a celebrated historian; but none of his writings are extant. He died at the age of 96, B.C. 262. Brucker by Enfield, vol. i.

TIMAGENUS, in *Ancient Geography*, an island in the Arabic gulf. Ptol.

TIMANA, in *Geography*, a town of South America, in the province of Popayan; 80 miles E. of Popayan. N. lat. 2° 12'. E. long. 74° 46'.

TIMANTHES, in *Biography*, a famous Grecian painter, was, as it is said, a native of Cythnos, one of the islands called Cyclades, or of Sicyon, and flourished about the year B.C. 400. The mind of this artist is supposed to have surpassed his art, in the exercise of which he displayed great skill, so that in his performances, something was to be understood, which he did not express. As an instance of this, we are referred to his picture of Iphigenia about to be sacrificed, in which, having exhausted every variety of the expression of grief in the other spectators, he has thrown a veil over the face of her father, thus intimating that his anguish surpassed all external tokens. In his Sleeping Cyclops, exhibited in a small tablet, he has introduced Satyrs measuring his thumb with a thyrsus, in order to give an idea of the magnitude of the principal figure. At Samos he was a competitor with the famous Parrhasius in a piece, of which the subject was the judgment for the arms of Achilles, between Ajax and Ulysses; on this occasion the prize was awarded to Timanthes. In the temple of Peace at Rome a hero of admirable workmanship by the same artist was preserved. Pliny Nat. Hist.

TIMAR, a tract or portion of land, which the grand signior grants to a person on condition of serving him in war, on horseback.

Some define the timar a portion of land assigned to a spahi, or other person fit to serve on horseback, to enjoy, during life, for his subsistence.

Meninski describes it as a stipend or revenue, granted to old soldiers who have deserved well, in lands, and possessions of castles, towns, villages, fields, or in tithes, and other fruits and incomes; sometimes with the prefecture, jurisdiction, or signory of the said places.

The timar is a kind of fief granted for life. The whole Ottoman empire is divided into sangiackies, or banneries, under which all such as hold timars, who are called *timariots*, are bound to list themselves when summoned upon any expedition. Timars may be resigned as benefices among us, only obtaining the consent of the beglerbey, or governor of the province. Indeed, for timars of above 2000 aspers *per annum*, called *zaim*, the grand vizier alone grants dispensations.

TIMARIOTS, those who enjoy lands on the footing and tenure of timars. See TIMAR.

The timariots are obliged to serve in war, personally, with as many men and horses for service as their timar, by the estimate made of it, contains 2500 aspers, or about 6*l.* sterling; and to maintain them constantly mounted and armed after their manner, to be ready to march at all hours when commanded, and that on pain of death; nothing, not even sickness itself, being allowed to excuse them.

Besides this service, they likewise pay an acknowledgment of one-tenth of their revenue. If they have any children of age to bear arms, and fit for the service after their decease, or, in defect of this, if they have any relations that have the least interest, the timar is used to be continued to them on the same conditions, otherwise it is transferred to others.

If the revenue thus held of the grand signior exceed 15,000 aspers, or 36*l.* sterling, they who hold it are not called *timariots*, but *subassi*, or *zaims*: these always have the administration of justice in the place, under the sangiac of the province.

The timariots have different appointments, from 4000 or 5000 aspers, equal to about 12*l.* sterling, to 20,000 aspers: but unless their timar exceed 8000 aspers, they are never obliged to march, except when the grand signior goes to the army in person, on which occasion none are exempted.

The origin of the timariots is referred to the first sultans, who, being masters of the fiefs or lands of the empire, erected them into baronies or commanderies, to reward the services of their bravest soldiers; and especially to raise and keep on foot a number of troops without disbursing any money.

But it was Solyman II. that first established the order and discipline among these barons, or knights of the empire; and by his order it was, that the number of horsemen each should maintain was regulated.

This body has heretofore been not only exceedingly powerful, but great and illustrious throughout all the empire; but avarice, the ordinary fault of the Orientals, has occasioned their declension of late years.

The viceroys and governors of provinces manage their matters so at court, that timars, even out of their jurisdiction, are given to their domestics, or to such as will give them the most money for them.

There are two kinds of timariots, the one appointed by the Porte, the other by the viceroy of the country; but the revenues of both are less than those of the zaims, and their equipage and tents less in proportion.

Those who have their patents from the court, have from 5000 or 6000 aspers to 19,999 aspers *per annum*; if they have one asper more, they become zaims. Those who receive their patents from the viceroys, have from 3000 to 6000 aspers *per annum*.

This cavalry is better disciplined than that properly called the *spahis*, though the spahis be the neatest and briskest. These last only fight in platoons; whereas the zaims and timariots are divided into regiments, and commanded by colonels, under the direction of bashaws. The bashaw of Aleppo, when in the army, is colonel-general of this militia.

TIMARISTAN, in *Geography*, a town of Persia, in the province of Farsistan; 15 miles E. of Pasa.

TIMAVO, a river of Carniola, which runs into the gulf of Trieste, near Duino.

TIMAVUS, in *Ancient Geography*, a fountain, lake, river, and port of Venetia.

TIMBANG, in *Commerce*, a measure at Batavia for rice, pepper,

pepper, and other dry goods. It is reckoned at ten facks, or five pikuls: another measure is called kulack, and weighs $7\frac{1}{4}$ catts: 7 kulacks make one timbang, liquid measure.

TIMBER, in *Geography*, a river of Prussian Lithuania, which runs into the Nemouin; 4 miles N.E. of Wipe.—Also, a town of Prussian Lithuania, 6 miles W. of Insterburg.

TIMBER, or *Timber-Trees*, in *Rural Economy*, that sort of wood produce which is useful and proper for the purposes of building, the construction of tools, implements, carriages, &c.; or such large trees of different sorts as have reached their full or suitable states of growth, and are in situations fit for being cut down for use. The various kinds of trees which are the most useful and important in this intention, have been noticed and considered in speaking of the nature of common and other plantations and planting; but they are chiefly the different sorts of pines, the larch, the birch, the common ash, the mountain-ash, the beech, the sycamore, the elm, the oak, the horse and common chestnuts, the alder, and the poplar. However, in general, the oak, the ash, the elm, the larch, and the Scotch pine, are by much the most useful and valuable for all the different uses of this nature.

We shall here mention from Evelyn's *Sylva*, &c. some of those kinds of timber that are most serviceable, and give a brief view of the uses to which they are applied, referring to their several denominations and other collateral articles for a further detail.

1. *Oak*, the uses of which need no enumeration; to endure all seasons and weathers, there is no wood like it: hence its use in pales, shingles, posts, rails, boards, &c. For water-works, it is second to none; and where it lies exposed both to air and water, there is none equal to it.

2. *Elm*: this, felled between November and February, is all spine or heart, and no sap; and is of singular use in places where it either is always wet, or always dry: its toughness likewise makes it of use to wheelwrights, millwrights, &c.; nor must it be omitted, that its not being liable to break and fly in chips, makes it fit for dressers and planks to chop on.

3. *Beech*: its chief use is in turnery, joinery, upholstery, and the like, as being of a clean, white, fine grain, not apt to bend nor split: it has been sometimes, especially of late, used for building-timber, and if it lie constantly wet, is judged to outlast oak.

4. *Ash*: its use is almost universal; it is good for building, or other occasions where it may lie dry: it serves the carpenter, cooper, turner, ploughwright, wheelwright, gardener; as also it is used at sea for oars, handspikes, &c.

5. *Fir*, commonly known by the name of *deal*, is of late much used in building, especially within doors, for stairs, floors, wainscot, and most works of ornament.

6. *Walnut-tree*: this is of universal use, excepting for the outsides of buildings; none is better for the joiner's use, it being of a more curious brown colour than beech, and less subject to worms.

7. *Chestnut-tree*, next to oak, is the timber most sought for by joiners and carpenters. It is very lasting.

8. *Service-tree*, used in joinery, as being of a delicate grain, and fit for curiosities: it also yields beams of considerable size, proper for building.

9. *Poplar*, *abel*: this and *aspen*, differing very little from one another, are much used of late instead of fir: they look as well, and are tougher and harder.

10. *Alder*, much used for sewers or pipes to convey water: when kept always wet, it grows hard like a stone;

but where sometimes wet, and sometimes dry, it rots presently.

The uses of timber are so many, and so great, that the procuring of a sufficient supply of it extremely well deserves the care of every state; as it must be a great disadvantage to it to be obliged to have recourse to its neighbours, and purchase, at a very considerable and continually renewed expence, what might, by an easy economy, be sufficiently supplied at home.

This economy, however, must be applied in time; for our natural indolence, our love to reap the advantages of every thing ourselves, and our little care for posterity, give great room to fear succeeding ages will want wood, both for private and public exigencies. All our arts should be employed on this subject, with two views, the one to preserve and cherish our growing wood, the other to renew the trees which have been, and are continually cut down.

The quantity of acorns which the oak bears, has made many people suppose, that Nature has taken care for a renewal for us; and that of this vast quantity of seed, which annually fall, there will be always an over-sufficient supply of young trees, which will grow up in the place of the old ones: but experience proves, that this is by no means the case. The greater number of these fallen acorns is devoured by many different animals, for whose nourishment Nature has provided that abundance of them: and of those which escape this fate, we are to consider how few can come to good, from the natural accidents they are unavoidably exposed to; they fall on a covered ground, where dead leaves, and decayed parts of branches of trees, usually prevent their touching the earth; into which they are to shoot; or, if they can shoot here, it is merely from the surface, where they are, in their slow growth, liable, while very tender, to all the inclemencies of frosts; and add to this, that it is very difficult for such tender plants as the young seedlings of these to find room for growth or nourishment among the every-way spreading roots of other trees; and the continual shade and want of free air, must render them very weakly and irregular in their growth, even supposing them to get over all the other difficulties.

It is very certain, that timber-trees of oak are frequently met with among the underwood of forests; but we shall always find this to be the case, not in the close places, but in certain spots, where there has been a vacancy or opening; and that usually, where there are not, nor have at any time been, oaks in the neighbourhood of the spot. The acorns that fall from the oaks usually come to nothing from the before-mentioned accidents; and these trees which grow at distances, are owing to the acorns brought thither by birds, and accidentally dropped there. This is an instance familiarly verified, by observing, that there are frequently little bushes near woods, which, though of white-thorn or other trees, are usually surrounded and ornamented with young oaks; the jays and the like granivorous birds are the authors of this crop; for bringing the acorns from the adjoining woods, to eat under these bushes, they drop many by the way, which they do not trouble themselves to look for on the ground, and which having here a freer ground to strike root into, and an open air to grow in, seldom fail of coming to good, unless destroyed when young.

In order to the preservation of our growing timber-trees, it would be a very useful law, that all who cut down any number of oaks, should also leave a number in good condition for after-cutting; and that no timber should be cut down, but at a proper age, in regard to the nature of the soil;

TIMBER.

soil; since it is certain, that trees grow to their perfection at very different periods of time, in proportion to the depth of soil they have to grow in; and that as it is, on the one hand, not for the interest of the state to suffer trees to be cut till at their perfection for size and soundness, so after they are arrived at their perfection, it is equally certain that they gradually decay.

The quality of the soil the tree stands in may be necessary to be observed to this purpose; but the quantity or depth of it is the great subject of enquiry; and a great number of observations has proved, that the proper season for cutting oaks, in a soil of two feet and a half deep, is at fifty years old; those which stand in a soil of three feet and a half deep, should not be cut down before seventy years; and those which stand in a soil of four feet and a half deep, or more than that, will increase in goodness and in size till they are a hundred years old; and observation has proved, that after these several periods, the trees begin to decay.

This seems the best rule to establish, in regard to the common soils; but those which grow in a lighter or more sandy soil, may have their periods changed from these to forty, to sixty, and to eighty years at the greatest depth; and after these times it is always best to fell the wood meant for public service, whether then wanted or not, since it is much better to keep it in public magazines, than to leave it to be daily decaying.

Heaths, and other uncultivated places, where there is no regular growth of wood, but where fern and useless plants alone seem to flourish, usually afford also some straggling trees of the oak. These probably have had their origin from acorns dropped by birds; but they seldom grow tall or regular; since, not having been defended from the injuries of cattle, they are usually browsed on, and stunted while young, and so become crooked and short-trunked, or pollard-trees. These, though not of such value as the more regular oaks, yet deserve care, both with respect to their preservation and felling; since they afford a number of trees naturally bent, and formed for many parts of ship-building.

The little care usually taken of these trees, though on this occasion of great value, seems to threaten a general loss of them; but as trees, thus naturally crooked and bent, are of value, it is a laudable attempt to try at the finding of a regular method of producing such; and this is easily practicable, by following the same methods by which these wild ones become so. They wholly owe their figure to the cattle's biting off their tops while young, and afterwards biting off again the tops of the shoots from the first wound. In this manner, if a number of young trees, set apart for the experiment, have their tops cut off at two, four, six, eight, ten, and twelve feet from the ground, and four years afterwards the shoots from these stunted tops are again cut in the same manner, the trees will be found afterwards to grow up in all the irregularly crooked figures that can be conceived, and by this means a supply of naturally crooked wood may be raised for all the occasions of ship-building, with infinitely greater ease, and more certainty, than by the method proposed by some, of bending them down with weights tied to their tops while young. See *Growth of Crooked Timber*.

As to the supply of young wood in the place of what is cut down, there are some circumstances which have not had the attention paid to them which they deserve. The spring frosts, which come on at a time when the shoots, by which nature is to raise the supply for what is cut down, are just

preparing to grow, are of prodigious injury, and do not less mischief to these than to the young shoots of garden plants, though the distant hope of the succession of the proprietor, and usually also the distance of the place, and want of repeated observations, occasion its not being perceived. This, however, may in a great measure be guarded against. Frequent experiments and repeated observations prove, that the mischief done by these frosts affect in a much greater degree those shoots which are exposed to the south, than those which face the north: and that it is greatly more powerful against such as are wholly exposed to the wind, than against such as are sheltered. These known circumstances may give the hint to a method of saving, at least, a great part of the wood to be felled from this destruction, to its renewal, by the making it a rule to begin cutting down on the north side; and, as the whole felling is a work of some years, the standing wood of every season will defend the young shoots of the newly-cut stumps the following spring, not only from the south exposure, but will shelter them also from the wind.

Many prudent managers have made fine estates of their coppice-woods, by regularly felling a certain portion every year, and providing for a renewal of the first cutting, against the felling of the last portion, by proportioning the time of growth to the quantity to be cut every year; and there is great interest to be made of a true knowledge of the growth of wood in this manner. Whoever observes the growth of young trees, will find that the second year's growth is much more considerable than that of the first; the third year is more than that of the second, and so on for many years; the yearly growths of young wood greatly increasing every season up to a certain time or age of the tree, after which the increase in bulk, by growth, becomes gradually less. The great advantage to be made of coppice-wood, would be by knowing this interesting period, and seizing on it, always to cut down the trees just at that time when they arrived at the end of their quick growth, and so setting nature to work with new shoots, to employ the same on enriching again the owner. Regular observation and experiment alone can ascertain this happy period; but any man who has much coppice-wood upon his estate, may assure himself of it, by cutting a given quantity every year, for ten years successively, and then carefully reviewing the differences of the yearly produce. *Memoirs Acad. Scienc. Ann. 1739.*

On the business of raising and growing good timber, or trees of that sort, Mr. Loudon has thrown out some interesting, ingenious, and philosophical hints and suggestions, as well as stated some strong facts in confirmation of them, in his work on forming and improving country residences. It is considered as remarkable, that the matter has never particularly engaged the attention of those who have been employed in describing the methods of rearing trees. The effects of culture on other vegetables is so great, it is said, as always to change their appearance, and not unfrequently to alter, in a considerable degree, their nature. The common culinary vegetables, and cultivated grasses, assume so different an appearance in our fields and gardens from what they do in a state of wild nature, that even a person accustomed to the nature of plants might easily be deceived in regard to the species or kind. The same general laws operate upon the whole kingdom of vegetables; and thence it is thought plain, that the effects of culture upon trees, though different in degree, must be analogous in their nature. It is true, it is said, that as yet we are possessed of no great number of either experiments or observations, to enable us to determine with minute accuracy the precise extent

TIMBER.

of these effects; but still a person practically conversant with the subject, who shall pay attention to what he may notice to be taking place in different parts of the country, and who possesses a sufficient knowledge of the vegetable kingdom and physiology to reason from analogy, may, it is thought, deduce such general consequences, as will suggest important practical rules and regulations.

It may be proper, it is said, to remark, that by culture is not meant merely the operations upon the soil, or on even the form of the particular tree; but every thing that tends to remove it from its natural state in order to accelerate vegetation. It is considered too, that a tree is in a natural *state* whenever it has sprung up fortuitously, and propagates itself without aid from man: whether it be in crowded forests, woody wailes, or in scattered groups on hills or commons. Some trees and other vegetables may be said to be naturalized to situations which, but for art, they probably never would have grown upon. Thus, for instance, mountain plants are sometimes found common in plains, and even meadows; and alpine trees which disseminate themselves in level and warmer parts of the country: but then the person who is conversant with such matters, by comparing the effects of these different situations on the vegetable, always knows to select as general nature that which perfects all the parts, and where the soil and situation are best suited for the reproduction of the species or sort, and the prolongation of individual life. These rules are, it is said, founded in nature. For example; no person, judging from them, could mistake a warm English common as the natural soil and situation of Scotch firs, though they not unfrequently disseminate themselves there. It is, indeed, well known to every one in the least conversant with the vegetable economy, that in all herbaceous vegetables, and even shrubs of considerable size, the effect of removal to an improved soil, climate, and situation, is to expand the parts of the whole vegetable: that the effect of removing or cutting off part of the vegetable above ground is to expand those parts which remain: that the effect of removing any of the parts under ground, or of removing the whole vegetable into a colder climate and less congenial soil and situation, is to contract or consolidate the whole. This, were it necessary, could, it is said, be illustrated in a thousand instances from the commonest vegetables: but for the present purpose, it is only necessary to notice further, that this takes place more or less in a degree corresponding with the rapidity of the growth of the vegetable, and its duration. Thus, all the annual grasses are much farther removed from a state of nature by culture than the perennial ones. So are the annual garden vegetables, as cabbages, legumes, and spinach, in opposition to strawberries, asparagus, and many others. Quick growing trees or shrubs, as willows, raspberries, and some others, are also much easier removed from their natural state, than such as oaks, thorns, hollies, and heaths, which grow much slower. If these remarks and conclusions be just and well-founded, which, it is supposed, none will deny, it must follow that the same general effects take place more or less on all trees; that when they are removed into a colder climate, or have part of their roots cut off, it will in some degree contract the fibre of the wood, and render it of a more solid and hard texture; and that when they are removed into a warmer climate, have most of their branches taken off, or are placed in a better *state*, it must, by accelerating their growth, it is thought, tend to expand the fibre of the wood, and of course render the wood softer and more liable to suffer by the action of the common elements, when the tree is cut down and applied to use. That this does really take place, will, it is said, be gathered from the detached facts stated below, which have

come to the writer's knowledge, and to which every practical unprejudiced person, who has visited different parts of the kingdom, will, it is thought, be able to add many others from his particular observation, attention, and examination.

First, that every hedger and forester knows, that furze and thorns, which have been cultivated in fields or hedges, are of a much softer or wider grain, and are much easier cut over with the hedge-bill, than such as spring up from seed in a wild scenery, and never undergo any sort of pruning or cutting in, nor any kind of culture in any way. They know too, that in a common to be cleared of furze or thorns, or in a hedge to be cut over, there are some parts which require a much slighter stroke of the hedge-bill than others; and that those parts easiest to cut, are uniformly those where the plants have grown the quickest:—gardeners experience the same thing in pruning or cutting over fruit-trees or shrubs. Thus the difference between the texture of the cultivated and the wild raspberry is, it is said, striking, though the stem of the one is nearly double the thickness of that of the other. In all the other of these cases, the stems of both are supposed alike in diameter and cleanness, or absence of knots; though the same thing would, it is thought, take place in a considerable degree, even if the stem of the cultivated or quick growing one were thicker than that of the other in the wild state. Supposing that there were no other proofs, this, it is contended, clearly shews that cultivation, or whatever tends to increase the growth of a tree, tends likewise to expand the vegetable fibre. But there are other concurring proofs, it is said, which demonstrate this, and at the same time shew, what few, it is supposed, will doubt, that when the vegetable fibre is expanded, or when the annual ringlets or circles of wood, produced by a tree, are soft and larger than the general annual increase of such tree, the timber must be less hard, and more permeable by air, water, heat, and other matters, and, of course, inferior for all the purposes of timber.

Secondly, that it is well known that the common oak in Italy, where it grows faster than in this country, is comparatively of short duration. And that the oak which grows on the mountains of the Highlands of Scotland is much harder and closer than any produced in England, though on these mountains it seldom attains one-tenth part of the size of English trees. Every country carpenter in Scotland knows, it is said, the extreme difference between the duration of Highland and English oak for spokes of wheels. Many hedge-carpenters in both parts of the country know the relative duration of transplanted or *plantation* oaks, that is, the young oaks which are thinned out from thriving plantations of this sort, and those from natural forests, when employed as posts for railing. From different observations which the writer has made in Monmouthshire and Herefordshire, the duration of the oak in these counties, it is thought, is much inferior to what it is in Cumberland and Yorkshire: it is thought no exaggeration, when it is said that the difference is as eight to ten. Some timber dealers are known by the writer, who, in purchasing it, pay attention to the difference of soil and situation even in the same woods. When they can find oak in exposed situations and on deep clay soil, and ash on rocky steepes, they always give them the preference in their purchases as timber.

Thirdly; that a known fact is stated by the writer which is said to be of such importance, that it is trusted, if it does not satisfy every unprejudiced person in respect to the truth of the general principles which are wished to be here laid down and explained, it will at least arrest the attention of all those who are interested in the quality as well as mere bulk

of timber : and this, it is thought, may lead to more extensive observations, and perhaps more favourable conclusions relative to it.

The plantations of the timber kind which were made at Kinnaird castle in the years 1770—1790, are, it is said, well known in the north of Scotland. They were chiefly of deciduous trees, among which were generally introduced larches for shelter. These larches, in some places, grow with astonishing rapidity. On many slopes, where the surface-soil was good though not deep, and the sub-soil a sandy gravel, they advanced upwards of five feet a year for the first six or eight years after being put in. As they overtopped and crowded the deciduous trees, they were gradually felled ; and as much had been said about the durability of larch-wood, the first trees that were cut down were fawn up, and applied to a purpose which was perhaps, it is thought, one of the best tests of their durable properties. This purpose was the foot-paths of peach-houses and vineries, where they were exposed to alternate drought and moisture, heat and cold, and where common deal and other kinds of wood had repeatedly failed. The larch deal of these trees was, it is stated, applied in the same way as the others, and in less than two years was completely rotten and destroyed !

It may, it is conceived, be alleged by some, that this could only hold true in regard to the *sap*, or last formed wood : but the *heart*, or red central wood which was present, though it lasted longer, did not, it is affirmed, endure three years ! The vast number of these trees annually taken down, were afterwards, it is said, chiefly made use of as fuel ; and though this wood had been asserted not to flame, or be consumed without the assistance of other wood, it did not, in this case, flame violently, but it burned by itself without care or attention, and unassisted from other timber-wood, producing numerous fires for labourer's uses. In rendering it fit for this purpose too, the workmen found it extremely brittle, a tree a foot in diameter being often broken with the greatest ease, by means of two or three blows given with the back of the hatchet. The tops and side-branches of them were likewise remarkably light and brittle, as are known to many persons in that part of the country as well as this. See *TIMBER, Crooked Growth of*.

These facts are said to deserve a very serious attention, and to lead to very important conclusions, in respect to the cultivation and growth of this tree as timber in this country. They are not solitary ones ; for though, as yet, sufficient time has not elapsed for a fair trial of this wood in different soils and situations, yet some have found it much less durable than others ; and that an attentive, nice observer will, it is thought, perceive larch-trees in some rich warm situations in a decaying state, and others growing so rapidly, or so much side-lopped or pruned, as to suggest doubts, whether their duration will be much longer than those of the above castle.

And, fourthly, that in Scotland, the difference of durability between common fir-wood which has been of slow growth, and that which has been *forced*, as it is termed, either by shelter, advantageous soil, situation, or climate, or by lopping off the side-branches, is known to every carpenter in the more northern parts of it, especially in the districts of Perth, Stirling, and Argyle. There, it is said, they distinguish the wood cut as timber in the native forests, from that obtained in plantations, by calling the former highland-fir, and the latter park-fir. The highland-fir is most esteemed, on account of its greater durability, being frequently found undecayed in ancient buildings when other sorts are entirely wasted. These circumstances are strongly supported, it is thought, by Mr. Lambert, who, in speak-

ing of the genus *Pinus*, has said, that "this striking difference between the highland and park fir, is probably to be attributed to the mountainous and rocky situations in which the native timber is found, and where, the trees being of slower growth, the wood is consequently of a harder texture." The same writer is of opinion too, it is said, that few species of pines will endure more than forty years in the soils in which they are commonly set out or planted in England. Indeed, there are many proofs of this, it is thought, from Croom, Kew, and other places ; though there are some excellent fir-trees at Langhangles, where the soil is deep and cold, that are much older than that period. The greater durability of the former sort of fir-timber may be daily seen, it is said, in the still more northern districts of Aberdeen, Bamff, and some others, during the removal of old farm-houses and cottages ; as wherever a piece of the highland-fir appears, it is always of a much deeper yellow than the park or low country fir. At Gogar, it is said, some large fir-trees were taken down in 1795 : they grew upon a deep cold loam ; the wood was fawn up, and was found of excellent quality as timber. About a mile from this, at Lenny Park, a dry bank is covered with fir-trees of greater age than those of the former situation ; some of them have been taken down at different periods before and since that time, and have uniformly been found of inferior quality as timber-wood. In 1804, too, a number of fir-trees were taken down from the rocky banks of the Almond, between Craigie Hall and Cramond House ; and they were found of excellent quality in their wood. While at Bevelaw, there are extensive plantations of fir-trees, which have been often thinned ; but the trees have grown so fast, and been so much cut or pruned in the branches, that they never last long, it is said, as paling. All these cases have either come under the writer's own particular notice, or that of a relation of his, who is highly interested in the value of park-fir, and, of course, has paid a more than common attention to the matter. A great number of other instances might, it is said, be here added, but it is unnecessary : and the comparison of the wood of the common crab, the father of the orchard, with that of the cultivated apple, is in support of the same. Any person who will take the trouble to examine the fir-woods at Gordon Castle, and contrast them with others in the county of Perth, and those in England, will, it is thought, unquestionably come to these conclusions : that *slow growth* is essentially necessary to the *durability* of fir-timber ; and that wherever the *accumulation* of wood has been *accelerated* by culture of the soil, improvement of the climate, or by cutting and pruning, it is *injured* in quality in proportion to the ratio in which these agents have been employed. It is not said, that no branches should ever be cut from fir-trees, but that it is certain that judgment must direct to cut off, *in general* only, such as indicate that they are no longer of much use, which is easily discovered by marks of approaching decay.

Much of the above principles, reasonings, and conclusions, is probably, in some measure, equally applicable to other sorts of timber.

In the raising and growth of timber of the fir or Scots pine kind, it is found not well suited to very elevated situations, as the sharpness and keenness of such exposures bring it too quickly into a state of decay and death. The writer of an agricultural survey of one of the more northern districts of Scotland has remarked, that there is a kind of laminated clay, much disposed to dissolve with water, which is not favourable to the growth of this, or any of the pine tribe. It succeeds very well, it is said, however, in

TIMBER.

most parts of the clay ground of that tract, if care be taken to prevent stagnant water. It does exceedingly well too on land covering the freestone rock; but that the best timber of this sort is produced on hard dry gravelly soils. But that the Siberian pine, and some others of a similar nature, have been introduced with very little success. The short intervals of mild weather which happen in the beginning of the spring, excite them to vegetate too early, and the next cold blast destroys the young buds. The New England pine thrives in a tolerable soil, until from twelve to twenty years of age, in proportion to the nature of the exposure, after which it generally begins to decay. And that the spruce is likewise unfit to weather the storm on the greatest heights. It succeeds on the hard dry rock where the Scots pine dies, but frequently decays at the end of eighteen or twenty years, on stiff wet clay. Its most favourite soil for timber is that which is dry and gravelly. The silver fir thrives in clay soils, where the spruce fails; nor is it averse either to the hard rock or gravelly soil, which probably affords the best timber; but it makes little or no progress on any soil that is very poor. It unfortunately too frequently suffers severely from the frosty mildews of the spring, especially in its youth, or more early state of growth. However, the *larix* or larch is now found to be the most hardy alpine plant. In moist places, it makes greater progress than almost any other timber-tree, and there is scarcely any soil, that is not drowned with water, on which it will not succeed. It suffers most in too luxurious situations, where its soft shoots, unable to keep erect, bend away from the slightest gale, and its timber produce is probably the worst. It is liable while young, in some situations, to be much injured or wholly destroyed by early spring frosts taking place after mild weather has brought on its vegetation, and is occasionally seized with disease, and dies when placed on miry clay.

It is suggested that the birch is next to the larch in the progress of its growth, and equal to it in ability to stand the blast in alpine situations; and that it is superior to it in the plain. But in whatever situation it is placed, it delights most in a light soil and dry bottom, probably producing in such the best timber-wood. It, however, thrives in moist soils, with very moderate draining.

The ash also, when it enjoys a sufficient depth of good soil, is capable of braving the storm, and pushing up its head in the most exposed situations; however, in a thin soil, covering a stiff argillaceous bottom, it can make no progress. It notwithstanding thrives well in some marshy soils, where the banks are steep, so that the water gets away without stagnating. On dry rocky steeps, the timber is probably the best. It forms perhaps the most important wood in the country as timber, being useful in all its ages and states, and fit for most purposes.

The mountain-ash is likewise a hardy native, which grows freely in almost all soils and exposures; but its favourite situation seems to be in hanging banks, among woods and coppices, where the timber-wood is perhaps the best. This and the gean-tree, or wild cherry, raise and propagate themselves much when left at liberty, by putting up or out suckers from their roots.

The beech is said to come near to the ash in capability of braving the storm, and has much the advantage of it in thriving in poor or stiff soils; but there are some barren argillaceous bottoms too much even for the beech; and it is most successful, and affords the best timber, in friable soils. Its shoots, while young, are soon affected by frost, but the tree speedily recovers.

The sycamore and elm require a light soil, and a dry,

open under-stratum: and when this is the case, the timber is the best, and the trees thrive in a situation pretty much exposed. They form good timber too on some soils of a heavier nature.

In regard to the oak, it is less patient of the blast than most of the timber-trees of the forest. Being late in putting forth its leaves, it continues to grow till the season is far advanced; and the immature wood of its late shoots, unable to resist the piercing effects of the cold wind in exposed situations, withers before the next spring; so that, like Penelope's web, the progress of one season is undone in the following. The most favourable situations for the oak, as timber or otherwise, are therefore hollows or hanging slopes, where the sharp cutting winds are broken by the neighbouring heights. In such situations, if stagnant moisture be avoided, it will thrive in the stiffest soils, and with its strong roots penetrate the deepest bottoms, affording good timber. Though the growth of this tree be slow in infancy, when it is placed in a favourable situation, it will make a progress in the course of fifty years, little inferior to many other kinds, and at length arrive at a great size of timber. See these timber-trees.

It has been found that the horse chestnut-tree thrives well on the lower grounds, and deep soils only. The sweet chestnut, which quickly becomes a timber-tree in districts more northern than this, does not succeed here. Its seasons of growth are too early, or too late, for the climate. In its first, it bears some resemblance to the Siberian pine, &c.; in its last, to the oak; its early growths being almost as early as the former, and its later being nearly as late as those of the latter, and still more soft and susceptible of the cold. Hence its shoots are alternately put forth and destroyed, and it generally becomes a low, stunted, shrubby tree. But this, it is said, does not seem to have always been the case. The fate of the common walnut, which may be considered almost as much a timber as a fruit-tree, is nearly the same with that of the sweet chestnut. It probably affords the best timber on dry friable soils of some depth.

The poplar and most of that tribe delight most in water-formed soils, but are commonly averse to marsh, and, when happily situated, make quicker progress than almost any other sorts of trees, producing much light useful timber. See CHESNUT, WALNUT, and POPLAR.

Management of Timber.—The rules and regulations for the management of fir and other timber-trees, which are given below, deserve attention. Mr. Salmon, of Woburn, in Bedfordshire, who is in favour of much lopping or cutting of the side-branches of fir-timber, remarks, in a late volume of the Transactions of the Society of Arts, &c. that considering the purposes that this sort of timber is commonly applied to, it must occur that clearness of knots, straightness, length, and equality of size of the trunk, constitute its perfection, and that, if deficient in all these, it is of no value but for the fire. Next to these considerations, and the prospect of an improved knowledge of raising and cultivating this kind of timber-wood, it may, it is said, be a fair question, if our own country be not capable of producing this timber little or not at all inferior to foreign fir? In this country at present, fir appears, it is thought, not for any length of time to have been considered much otherwise than as ornamental. For this purpose they serve only for a certain time, which, when past, it has been their fate to be cut down long before having attained maturity. But from the great extent of ground now covered with this sort of timber-tree, it is to be hoped, it is said, that another century may obtain to English fir some of the character of the oak of the same country: towards such an end, if attainable,

TIMBER.

every means should, it is said, be used, and towards which nothing appears more likely to succeed, than a well-grounded general practical mode of management, from the time of the trees being put out, to their greatest imaginable age of improvement. That a knowledge of such may by perseverance be gained, is not, it is said, much to be doubted, as from different specimens there appears great reason to conclude, that early and proper side-logging the branches, and thinning out the young trees, will form a considerable feature in the plan and system to be adopted and pursued.

The subsequent plan and rules for the general management in these cases, are given as the partial result of practical experience, but of only a few years' observations.

In the raising of this sort of timber, from every authority and observation, there can be no doubt, it is thought, that all firs should be set out or planted thick or near together, as not more than four or five feet apart. That where firs of the same kind are put out together, there is less loss of plants, too, from one sort not overgrowing and destroying the others; consequently, that it appears advisable that all the different sorts should be set out separately by themselves. If any admixture at all be admitted, the Scotch fir and larch may, perhaps, best succeed together; but this is not certain, and they will unquestionably be best separate on two accounts; first, because they are not so likely to injure each other; and, secondly, because the larch may be put into the soil best suited for it, and the Scotch fir the same. And that in raising any particular sort extensively, it may be right to have a few of the spruce sort, or others, on the out or exposed sides, to prevent mischief from sudden gusts or blasts of wind: but if the situation be not liable to such gusts, the spruce had better be omitted, being mechanical agents only, and, by excluding the sun and air, act against the operations of nature. However, in these hints, ornament is not, it is said, considered, but only timber: if the former be wanted, and profit also, then the spruce, the larch, the silver, and some other sorts, may be combined.

It is contended, that from some years' observations on cutting out and side-logging the branches, and the effects thereof, it appears certain that fir-trees, whenever they arrive at a certain age, should be cut or lopped to a certain height; and that for regulating thereof, the simple rule given below is recommended: the cutting-in to commence when the trees are six years old, or when there is discernible five tier of boughs and the shoot; the three lower tier of boughs are then to be taken off. After the first lopping or cutting-in, the trees to be let alone for four or five years, and then, and at every succeeding four or five years, the cuttings-in to be repeated, till the stem of the tree be clear to forty feet high, after which, as to such side-logging, it may be left to nature. The rule for the height of thinning and cutting-in, after the first time, to be half the extreme height of the tree, until they attain twenty years' growth, and after that time, half the height of the tree, and as many feet more as it is inches in diameter at four feet from the ground. This cutting-out and retrenching the branches of such trees is known, from repeated observations, it is said, not to be excessive; and that the rule is calculated to check the too tapering top, and for strengthening the slender bottom, by carrying the cutting and retrenching to a greater proportionate degree, in a ratio compounded of the height and bottom bulk; and by this rule, too, it may be observed, that the trees will be at top clothed with somewhat less than half their branches. The proper time for such cutting-in is, it is said, between September and April, and the tool to be employed in the business, the saw.

It is noticed, that orderly thinning the trees at certain

periods; when for timber, is the next essential to that of cutting in and lopping their side-branches; and that for this purpose, observations have been made on the most orderly and thriving collections of this sort of trees, and the subsequent simple rule is laid down: keep the distance of the trees from each other equal to one-fifth of their height. In the application of this rule to this purpose, it is evident that each individual tree can never be made to comply, for the original distance (even if set out in the most regular order) will allow only for certain modifications, by taking out every other tree, and so on; but even if the obtaining such equal distance were practicable, experience would shew, it is thought, that another way should be preferred, of which the eye must be the judge, by taking out such trees as are least thriving, stand nearest to other good trees, &c. &c. at the same time keeping in view the rule laid down: the directions and rules for which, given below, may easily be proved, by measuring a chain square, or any quantity of the land, and counting the trees thereon; then, by trying the height of two or three trees in that quarter, and taking one-fifth of such for the distance, it would be readily seen how many trees for timber should be contained in the piece measured: or the practice may be more simply regulated, it is said, by taking the distance of eight or ten such trees added together, the average of which should be equal to a fifth of the height of the trees. In these rules and directions there is nothing impracticable or complicated, it is thought.

The writer states, too, that he has for years known the expence and produce of this side-trimming alone, and finds that in Bedfordshire the produce of it doubly repays the charge or cost; and that although some experimentalists may differ from him, or time may shew some reason for somewhat deviating from his rule, it is presumed all will agree that some simple plan is advisable, instead of having timber collections and woods mismanaged, to the great loss of the community and their proprietors. If such a plan of proceeding, as is here proposed, be generally promulgated, if not perfect, it will most likely, it is thought, in time become so, and thereby have its advantage; and in order to promote this, these concluding remarks are given: in the common course of gardening, it is understood that cutting and trimming invigorate the tree; that taking off the side-branches makes the upright ones shoot the stronger; and by cutting out the dead and decayed wood, the tree is kept alive: some of this doctrine will, it is supposed, certainly apply to the tribe of firs; it will certainly, too, substitute clean timber-wood for knots: and of all this treatment, from their particular uses, they of all other trees stand in most need, and will be the most improved by it. And that should it be admitted that the like treatment would on the fir, as well as other trees, produce the like effect, it would lead to a well-grounded expectation that, as well as producing clearness from knots, straightness, and length, the same operation would advance the quality nearer to that of foreign fir; for it may be traced, that where trees are tall and clear of boughs or knots, the whole substance of the wood is better and of finer grain, and that it appears likely that such will always be the case; the reason of which may probably, it is thought, be inferred from the sap having farther to rise and descend, and having no boughs to divert or delay it, the circulation must be more free and rapid, most increase be left in the neighbourhood of the boughs at the top of the tree, and least on the sides at the lower part, consequently adding to the length of the head, and rendering more fine each annual increase to the body; thereby producing a close-grained, clean, long, and regular

TIMBER.

easy-tapering useful piece of timber, instead of a coarse-grained, short, sudden-tapering trunk, with a quantity of boughs and knots.

The foregoing rules, directions, and observations, are meant, it is said, to apply to fir-timber only, but to a certain extent they may be applied to other timber; though by no means in the same degree or age. But if had recourse to as far as the first fourteen years of their growth, and then such cutting and side-logging be altogether omitted, and the thinning out very much increased, any collection of such timber-trees would, it is thought, be rendered much more valuable than if left to nature.

The first of the above writers has, however, already stated, that the general effects of side-cutting or lopping the branches of fir, and probably some other timber-trees, are of a corresponding nature with that of culture; that is, to increase the quantity of timber produce. And that the particular manner in which it does this, is by directing the greater part of the sap, which commonly spreads itself in the side-branches, into the main stem. This must, of course, necessarily enlarge that stem in a more than ordinary degree, by increasing the annual layers or circles of wood.

Now if the tree happen to be in a worse soil and climate than those which are natural to it, this will, it is supposed, be of some advantage, as the extra increase of timber will still be of a quality not inferior to what would take place in its natural state; or, in other words, it will agree with that state of quality and quantity of timber which the nature of the species, or sort of tree, admits of being produced. But if the tree be in its natural state, the annual increased produce of timber occasioned by this cutting or lopping the side-branches, must necessarily injure its quality, in a degree corresponding with the increased quantity. And if the tree be in a better climate and soil than that which is natural to it, and at the same time the annual increase of wood be promoted by such cutting means, it is evident, it is said, that such wood must be of a very indifferent quality from that produced in its natural state.

Consequently, although it might, in some degree, it is supposed, be shewn from vegetable anatomy, and the analogy of what takes place in herbaceous vegetables, it is preferred to deduce, from the facts stated above, this proposition: that whatever tends to increase the wood in a greater degree than what is natural to the species or kind when in its natural state, must injure the quality of timber. Cutting or lopping the side-branches tends to increase this in a considerable degree; and, therefore, it must, it is thought, be a pernicious practice, in so far as it is used in these cases.

It has been shewn, it is said, in a very striking manner by Mr. Knight, that timber is produced, or rather that the alburnum, or sap-wood, is rendered ligneous, by the motion of the tree during the descent of the true sap. It is sufficiently known, too, to all who have attended to the physiology of vegetables, and greatly confirmed by some experiments not long ago communicated to the Royal Society by the same writer, that the solid texture of the wood greatly depends upon the quantity of sap, which must necessarily descend, and likewise on the slowness of its descent. Now both these requisites are, it is contended, materially increased by side-shoots or branches, which retain a large quantity of sap, and by their junction with the stem occasion a contraction and twisted direction of the vessels, that obstructs the progress of this juice. That this is true in fact, is well known to those accustomed to make wine from maple or birch trees, as in this business it is found that those trees which have the fewest side-branches, bleed more freely than the others, but during a much shorter

space of time. These hints, consequently, afford additional evidence against the practice of cutting or lopping the side-branches of timber-trees, and especially against that of using it for fir-trees, which, as the above writer justly remarks, it is said, have larger vessels than most others, and therefore, when in an improved soil and climate, side-branches for the above purposes are essentially necessary, if solid, resinous, and durable timber be the object in view.

The following conclusions may, of course, it is thought, be drawn in respect to the management of timber-trees from the above facts and remarks. First, that timber-trees should be set out in soils, situations, and climates, as much as possible analogous to those of their natural state: and that it is chiefly in this state, or where there are some defects in regard to them, that such cutting or lopping and culture can be exercised with advantage. Secondly, that in proportion to the superiority of the soil, &c. in which trees are put, over the natural soil of such trees; in the same proportion lopping and cultivating the soil ought to be avoided, and thinning encouraged. Thirdly, that particular regard should be had to the soil and situation, where either larches or any of the pine tribe are placed out to remain finally for produce as timber: for as the roots of these chiefly run along the surface, and as in them the great current of the sap is principally confined to one channel, that is, the trunk, that tribe of trees is, of course, peculiarly liable to change when subjected to unnatural agency of these kinds. Fourthly, that the only way in which oak-timber of *safe* quality can be raised and provided for the navy of this country, is by inclosing, preserving from cattle, and properly managing, those royal forests where oak is the natural produce of the soil. The neglect of this advice, there is reason to fear, it is said, may at some future day be regretted. For park-oak, as has been seen, is by no means unfrequently much inferior to that of the forest kind in durability. And that, lastly, as the practice advised tends to render trees characteristic of their peculiar species or kind, it must consequently be the most agreeable to ornament too, or the principles of natural taste.

The necessity of considering, thus fully, this branch of the management of timber-trees is, because the matter seems, it is said, to have been almost entirely overlooked by practical men, who appear, in general, to think culture and lopping, or cutting-in, of no other utility than to increase the produce in the quantity of timber. Though they are not, however, to be discarded in many other views, yet if solid and durable timber be the object, they ought, it is thought, to be had recourse to with caution, and in a discriminate manner. As a contrary plan of proceeding has been attempted to be enforced by some, as has been seen, it is thought necessary to arouse the attention of the country to the raising and improved management of the important article of timber, especially as the consequences of that plan are supposed to be more dangerous, as they cannot easily discover themselves until it be too late to apply a remedy.

In the management of timber-trees of the deciduous kinds, the lopping, cutting-in, and thinning, should be practised, in some measure, on the same principles as the above, but according to the particular nature, circumstances, and habits of growth of the different sorts; being constantly executed in such a manner, as to prevent any injury or inconvenience arising by the too extensive growth of the lateral shoots or branches, these being too few in number for the proper retention of the sap; and without the trees being left at too great a distance, and too naked and exposed. The trees for timber too are always to be kept clear of all foul wood, and any branches to be removed, taken off in a clean, careful, up-

ward direction, as where the parts are left in any way rugged or uneven, they are liable to catch and detain the wet and moisture, and conduct it to the hearts of the trees, by which they are not only greatly hurt in their growths, but often much spoiled as timber-wood. The thinning of the trees for timber should be performed at different suitable periods, so as to prevent too much crowding, and afford proper room for the full growth and increase of their wood, on the principles laid down above. See PRUNING and THINNING.

Sir Humphrey Davy has remarked in a late work, that trees possessing the firmest and the least porous heart-wood, are the longest in duration. That, in general, the quantity of charcoal afforded by woods, offers a tolerably accurate indication of their durability: those most abundant in charcoal and earthy matter are most permanent; and those that contain the largest proportion of gaseous elements are the most destructible. That, amongst our own trees, the chestnut and the oak are pre-eminent as to durability; and the chestnut affords rather more carbonaceous matter than the oak. That, in old Gothic buildings, these woods have been sometimes mistaken one for the other; but they may be easily known by this circumstance, that the pores in the alburnum of the oak are much larger and more thickly set, and are easily distinguished: whilst the pores in the chestnut require glasses to be seen distinctly. That, in consequence of the slow decay of the heart-wood of the oak and the chestnut, these trees, under favourable circumstances, attain an age, it is said, which cannot be much short of a thousand years. The beech, the ash, and the sycamore, most likely, never live half so long.

It is noticed too, that the oak and chestnut decay much sooner in a moist situation than in a dry sandy soil; and that their timber is less firm. The sap-vessels, in such cases, are more expanded, though less nourishing matter is carried into them; and the general texture of the formations of wood necessarily less firm. Such wood, it is said, splits more easily, and is more liable to be affected by variations in the state of the atmosphere.

The same trees, in general, are likewise much longer lived in the northern than in the southern climates. The reason of which seems to be, it is thought, that all fermentation and decomposition are checked by cold; and that at very low temperatures, both animal and vegetable matters altogether resist putrefaction: and in the northern winter, not only vegetable life, but likewise vegetable decay must be at a stand.

The antiputrescent quality of cold climates is, it is said, fully illustrated in the instances of the rhinoceros and mammoth lately found in Siberia entire, beneath the frozen soil, in which they most probably have existed from the time of the deluge.

Trees that grow in situations much exposed to winds, have harder and firmer wood than such as are considerably sheltered. The dense sap is determined, by the agitation of the smaller branches, to the trunk and large branches; where the new alburnum formed is consequently thick and firm: such trees abound in the crooked limbs fitted for forming knee-timber, which is necessary for joining the decks and the sides of ships. The gales in elevated situations gradually act so as to give the tree the form best calculated to resist their effects. And the mountain oak rises robust and sturdy; fixed firmly in the soil, and able to oppose the full force of the tempest.

Different states of timber are chosen for different uses, but the above writer remarks, that ship-builders prefer for their purposes that kind of oak-timber afforded by trees that have had their bark stripped off in the spring, and

which have been cut in the autumn or winter following. The reason of the superiority of this timber is, it is thought, that the concrete sap is expanded in the spring in the sprouting of the leaf; and the circulation being destroyed, it is not formed anew: and the wood, having its pores free from saccharine matter, is less liable to undergo fermentation from the action of moisture and air.

It must, however, be considered as very extraordinary, that in a country where the navy is a matter of such vast importance, and in districts where the oak, or other sorts of timber-wood useful for the same purpose, may be said to be almost the staple articles, no complete or satisfactory trials should have yet ever been made of the means of increasing the duration of such timber, which are mostly so readily practicable, and so very material in their consequences.

Felling of Timber.—The proper periods or times of cutting down, or making falls of timber, as they are often called, must evidently, in some measure, depend upon and be regulated by the nature and the differences in the circumstances of the growths of the same or different kinds of trees. But as in them, as well as other living matters, there seem to be three stages of growth; as that of their early rising, their middle mature state, and that of their decline or decay; they may serve as more satisfactory guides in the business. In the first, the growth is mostly soft and rapid; in the second, it becomes firm, strong, and perfect; and in the last, it begins to become weak and unbound. Mr. Loudon has considered the beginning of the middlemost of these stages as the most profitable period or season for felling of timber; as after that time, though the tree may appear sound and healthy, its annual increase is so little, that the cutting it down and replacing it may be more beneficial than letting it remain. The number of years that a tree may stand before it arrives at such a state, must, it is said, vary in different soils, situations, and exposures; but the period itself may readily and without difficulty be ascertained,—by the annual shoots, the state of the bark, and by taking the circumference of the tree at the same place for two or three successive seasons, and comparing the difference. In the view of profit from timber produce, it is of material consequence, it is said, to cut down such collections of trees at maturity, or in their vigour and perfection, which, some suppose, for the oak, where the soil is natural, is from about the age of fifty to sixty or seventy years' growth. Many trees will stand a half, others a whole century after they are full grown, appear quite healthy, and, at the same time, make little or no increase of timber. There are particular cases too, depending on the nature and state of the markets, in which it may even be more profitable to cut timber before it is arrived at a full growth than afterwards.

It may be difficult, it is thought, to say when timber, which is principally planted for ornament, should be cut down. A tree, when young and fresh, is beautiful; when middle-aged, it is more or less picturesque; when in old age, strikingly so, with a degree of grandeur; and its greatest height of picturesque and sublimity, is when decaying under the pressure of age. Hence it is conceived, that if ornament, or expression, which is a more appropriate term, were the sole object in view, trees need almost never be cut down. But most persons have a feeling of what is beautiful; and though all may be struck with grandeur or sublimity, few have so much enthusiasm as to sacrifice the profit of valuable timber, for the pleasure of enjoying either of those characters.

The time and manner of cutting *underwood* and *undergrowth* will be seen under these heads.

There are persons in this country, who, unquestionably

TIMBER.

from neglect and mismanagement of their timber, are now, it is said, losing annually very handsome incomes. The loss of price which generally follows the refusal of a good or high offer, the certain loss of interest, the decay of timber, and the injuries arising from the incumbrance of full-grown trees, are irretrievable losses, which those who have the care and management of timber should studiously endeavour to avoid. But while the disadvantages of suffering timber to stand until it be overgrown are thus held out, it is far from proper or advisable to propose or favour the premature felling of it.

The season of the year for this work usually commences about the end of April; because the sap then rises, which makes the bark *run* freely, as it is technically termed; that is, it *strips* off the trees freely; so that where a quantity of timber for ordinary uses is to be felled, the statute 1 Jac. I. c. 22. formerly required it to be done between the 1st of April and the last of June, for the advantage of tanning: but this act was repealed by 48 Geo. III.

However, the opinions and practices of authors are very different as to the best season for felling timber: Vitruvius recommends an autumnal fall; others advise December and January: Cato was of opinion, that trees should have borne their fruit before felled; at least, that their fruit should be first ripe; which coincides with the sentiments of Vitruvius.

In effect, though timber unbarked be most obnoxious to worms, yet we find the wild oak, and many other kinds, if felled too late, when the sap begins to be full, to be very subject to worms; whereas about mid-winter, it neither casts, rifts, nor twines. If trees were felled at a more early season than April, it is said that the timber would be better seasoned.

It is, indeed, the common opinion, that timber which is felled in winter, is stronger, and more lasting, as being more firm and close, than that which is felled in summer. But M. Leeuwenhoek apprehends that there is no difference, except in the bark, and outermost ring of the wood, which in the summer are softer, and more easily pierced by the worm: wood consisting of hollow pipes, which, both in summer and winter, are full of moisture, and do not shrink in winter; and therefore the wood cannot be closer at one time than another, for if otherwise, it would be full of cracks and clefts. The unexpected and sudden rotting of some timber, he conceives to proceed from some inward decay in the tree before it was felled: having observed all trees to begin to decay at first in the midst or heart of the tree. Phil. Trans. N^o 213. or Abr. vol. i. p. 592.

The ancients had a great regard to the age of the moon in the felling of their timber. If their rules avail aught, they are these: fell timber in the wane, or four days after new moon; some say, let it be the last quarter. Pliny orders it to be in the very article of the change, which happening on the last day of the winter solstice, the timber, says he, will be immortal: Columella says, from the twentieth to the twenty-eighth day: Cato, four days after the full: Vegetius, from the fifteenth to the twenty-fifth, for ship-timber; but never in the increase, trees then most abounding with moisture, the only source of putrefaction.

Some even have a regard to the temper and time of the day; the wind to be low, neither east nor west, neither in frost, wet, nor dewy weather, and finally, never in the forenoon.

Lastly, some regard is had to the species: fir is best felled when it begins to spring, both as it then quits its coat best, and as the wood, according to Theophrastus, is by that means rendered wonderfully durable in water. Elm, says Mr. Worlidge, is to be felled between November and Ja-

nuary, in which case it will be all heart, at least the sap will be very inconsiderable: this, he adds, is also the only good season for felling ash. Some authors add farther, that in felling timber, care should be taken, first, only to cut it into the heart, and so to let it stand till dry; by which means the moisture is evacuated in drops, which would otherwise occasion putrefaction.

M. de Buffon observes, as a circumstance which greatly increases the strength and solidity of timber, that the trees intended to be felled for service, should first be stripped round of their bark, and suffered to stand and die upon the spot before the cutting. The fappy part, or blea of the oak, becomes by this management as hard and firm as the heart, and the real strength and density of the wood has been proved by many experiments to be greatly increased by it: nor is this practice detrimental to the proprietor, because the remaining stumps of these trees send up their young shoots as vigorously, as if they had been cut down in their natural condition. Mem. de l'Acad. Sc. Par. 1739.

When any tree is to be cut down for timber, the first thing to be taken care of is a skilful disbranching such limbs as may injure it in its fall. In felling the tree, it should always be cut as close to the ground as possible, unless it is intended to be grubbed up; and this will be of advantage both to the timber and the wood; for timber is never so much valued, if it be known to grow out of old stocks.

There are several different modes made use of in felling or taking down timber, and they must necessarily be somewhat various, according to the nature, extent, and kind, of which the collection may be, as well as in the methods of performing the work: thus, in groves of the deciduous timber kind, the trees are mostly best felled by gradually taking or thinning them out as they arrive at maturity; which, where they are to be continued, should be cut over by the surface of the ground, and the stools be each separately well fenced in, that by defending them from cattle, new trees may be produced; but when not designed to be continued, they may at once be rooted out. Groves of the fir or pine sort, or any single fir-tree of any kind, should at once be taken out by the roots. In woods, any timber-trees that may be cut down, should have their places as nearly as possible supplied by sapplings, or any other proper sorts of young timber-trees. However, previous to the work of felling, the trees should be marked by a proper person; in performing which, in a fall of timber, regard is to be had to the relative state of standing in the trees. In close timber-woods, the whole or nearly the whole may be marked and taken down; as if some which appear flourishing be left standing, they will not only be liable and in danger of being hurt in taking the others down; but, in consequence of their situation in regard to exposure being changed, will no longer continue to flourish. As their atmosphere is not only thus altered, and rendered too cool, perhaps, for their acquired habit, by the removal of the adjoining trees; but they thereby get room to throw out side-shoots from their stems; in consequence of which their tops die, and their growth is irrevocably stunted. While, on the contrary, in open woods of the same kind, thin hedge-rows, and other open spaces, such timber-trees only as are ripe for the axe, or are suitable for the intended purpose, should be marked: the youthful growing trees being left to be benefited most probably by an increase of air and head room, in an atmosphere and exposure to which they are habituated and accustomed. On estates that are timbered, it is directed that they should be frequently gone over by proper persons, who, let the price and demand for timber be what they may, should mark every tree which

wears the appearance of decay. Where the demand is brisk and the price high, he should go two steps further, and mark not only such as are full grown, but such also as are near perfection; for the interest of the money, the disincumbrance of the approaching young timbers, and the comparative advantages of a good market, are not to be bartered for any increase of timber which can reasonably be expected from trees in the last stage of their growth.

In the work of felling timber, three distinct methods are practised and had recourse to in different cases; as, first, that of cutting the trees *above ground*; severing them from their roots, by means of the axe or the saw; leaving what are termed *stools*, to occupy the spots where they stood. Second, that of cutting them, *within* the ground, with the axe and mattock; but leaving the principal parts of the roots in the soil. And third, that of *grubbing* them up by the roots, by the use of the spade and mattock; thus throwing them down with the butts and large roots adhering to the stems. The preference to be given to one or other of the two first modes of taking down timber-trees, rests, it is said, chiefly on the nature of the future application of the land upon which they grow. If it be intended to remain in the state of woodland, the first method, or the second, if too much of the main roots be not cut away, is the best and most eligible. But if the land is to be cleared for the purposes of agriculture, where sufficient hands can be had for dispatching the business, the second is, by far, the best. The last is improper in most cases.

The writer of the rural economy of the midland districts states, that there the methods of *stocking*, *axe-grubbing*, and *axe-felling* are practised. That the first is a kind of partial grubbing, in which the roots are cut through a foot or more from the stem; and, again, a foot or more from the inner cutting; taking up a short length of the thickest part of the roots, and digging a trench round the tree, wide enough to come at the downward roots. That the second, or *axe-grubbing*, is somewhat similar to the mode of grub-felling described below, except that the end of the butt is left larger in these places than in that case. And that the third, or *axe-felling*, is the common method of Yorkshire, and other places, of cutting off above ground, with the axe; a method which is seldom practised, except in some few cases where another crop of timber, or of coppice-wood, is designed to be taken. Stocking is the prevailing mode;—the charge for taking down varying with the size of the tree: for a tree of two feet in diameter, it is about a shilling; and about four-pence more for cutting off the butt; the stocking and butting being, for the most part, let together. Other modes, too, are practised in other districts in performing the business; as that of sawing the trees off in an horizontal manner close by the surface of the ground, by means of a long saw with one or both handles fixed on the upper side, the trees being first dipped in by the axe on the falling side.

The method of falling timber practised in the county of Norfolk, is said, by the same writer, to be uniform, and perhaps peculiar to the county. It is very aptly called grub-felling; the operation partaking both of grubbing and of felling with the axe, in the common way above ground; a method which is wasteful of timber. The woodman of this district, therefore, fells below the surface of the ground, by cutting off the horizontal roots close to the stem, which, instead of shortening, he, in effect, lengthens, by adding to it a conical point, cut out of the crown of the root; so that by this way of proceeding, a greater length of timber is obtained, than by first grubbing and afterwards cutting off

the butt with a saw. Grub-felling is, it is thought, without doubt, the most eligible way of taking down hedge-row timber; and this, it is supposed, accounts for its being the established practice in the above county.

The disposal of timber, which often takes place before it is cut down, is to be regulated by the *occasion* of it, as arising from the *state* of the timber, or other causes and circumstances. It is, however, seldom proper and beneficial to fell and cut it down before its most profitable state of growth is reached; though this principle may sometimes be set aside by particular circumstances, as the nature of a market; the value of the land it encumbers by its growth, being greater than its annual increase; the interest of the money it is worth, with that of the growth from the stools, being greater than the increase of the standing timber, &c. It is consequently rarely advantageous to suffer timber to remain upon its roots, after it has attained its *full growth*;—as, in this case, the whole of the interest is lost, it is said, to the owner; while the use of one of the most valuable articles of the produce of the country is lost to it and the whole community.

In speaking of oak-timber, the late bishop of Landaff has given some useful and interesting remarks in regard to the disposal of it, in the introduction to the Agricultural Report of the State of the County of Westmoreland. Where profit is considered, it is said every tree should be cut down and sold, when the annual increase in value of the tree by its growth, is less than the annual interest of the money it would sell for. This being admitted, it is only necessary to inquire into the annual increase in the value of oaks of different ages. After different statements, thirty-six shillings each are fixed upon as the price of trees that should be cut down and sold; as, if they be cut down before they arrive at that value, or if they be allowed to remain until they will sell for a much higher price, the proprietor of the soil or land on which they grow will be a loser. It is noticed too, as being the general opinion, that it is more profitable to fell and sell oak-wood at fifty or sixty years' growth, than to let it stand for navy timber to eighty or a hundred, owing to the low price that is now paid for oak-trees of large dimensions, either by the Navy Board or the East India Company. On this account, it is advised making a much greater increase of price than ordinary on timber of this sort of large scantling, as in place of four or five pounds the load, if eight or nine were given for trees containing each one hundred cubic feet and upwards, every person in the kingdom, it is thought, would have a reasonable motive for letting his timber stand until it became of a size fit for the use of the navy; whereas, according to the present established price, it is every one's interest to cut down and sell their trees before they arrive at a proper size to be useful as navy timber. This suggests, too, the necessity of attending to the royal forests in a more particular manner; and may be an additional inducement to the trying the cultivation and growth of the larch in them, and training it for ship-timber. See TIMBER, *Crooked Growth of*.

There are several different modes of disposing of timber according to the nature of it, the situation, and the customs of the districts to which it belongs; but the principal of them are, first, those of felling the trees standing; either by *auction*, by receiving *written* proposals, or by *bargain and sale*: second, cutting the trees down, and felling them in the rough; by any of the above modes: third, converting the fallen trees; that is, cutting them up into wares to which they are best adapted, or which are most saleable in the particular situation. On a large timbered estate, the first mode

TIMBER.

is, in common, the most adviseable to be had recourse to; in which case, an accurate *valuation* of the marked trees is to be made, before they are offered for sale: and, in the case of oak timber-wood, it is mostly proper, and always satisfactory, to have separate valuations of the timber and the bark.

In felling timber in the county of Norfolk, the prevailing practice is, according to the writer of the rural economy of that district, to fell it standing, at so much a ton when fallen; measuring the timber down to six inches timber girt; the *topwood* and the *bark* (of oak) becoming the property of the purchaser; who is usually at the expence of taking it down. And it is customary there, too, for the purchaser to dispose of the bark (of oak), and sometimes the topwood, by the same admeasurement.

In the midland districts, after disposing of and cutting out the timber, the arms or boughs of the trees are cut up into posts, rails, and cord-wood for charcoal; the *spray* being mostly made up into faggots.

The relative value of different sorts of timber may be said to depend almost wholly upon local circumstances, as those of contiguity and facility of being taken to the places where they are the most largely made use of, or where only employed. Some sorts are, however, every where valuable on account of either their general application, or their scarcity, such as the oak, the ash, the elm, the beech, and the still more valuable larch, and others of the first description: and of the latter, the common chestnut, the yew, the box, and the holly. The light products of different kinds, afforded by some timber-trees, are also of great use and value in most places.

Hunter, in his "Evelyn's Sylva," has justly remarked, that every person who can measure timber, thinks himself qualified to value standing trees; but that such men are often deceived in their estimates. That it is the perfect knowledge of the application of the different shaped trees that enables a man to be correct in such valuations. That a foot of wood may be of little importance to one trade, but of great value to another. This is the grand secret, it is thought, which enriches the purchasers of standing timber.

On the whole, the great and constant demand for timber, on account of the increasing scarcity of it, should induce the proprietors of lands which are proper and suitable for it, to attend as much as possible to the raising and providing of this great object of rural economy, and national as well as individual wealth.

TIMBER, Hardening of. See **HARDENING of Timber**, and **Seasoning of TIMBER**.

TIMBER, Seasoning of, a term used to express the preparing of timber after it is felled, for cutting and working up for use.

As soon as felled, it should be laid up in some dry airy place, but out of the reach of too much wind or sun, which, when in excess, will subject it to crack and fly. It is not to be set upright, but laid along, one tree upon another, only with some short blocks between, to give it the better airing, and prevent its becoming mouldy, which will rot the surface, and produce mushrooms on it. Some persons daub the trees all over with cow-dung, which occasions their drying equally, and prevents their cracking, as they are otherwise very apt to do.

Some recommend the burying of timber in the earth, as the best of all ways of seasoning it; and others have found it a fine preservative to bury their timber under the wheat in their granaries; but this cannot be made a general practice.

In Norway, they season their *deal* planks, by laying them

in salt-water for three or four days, when new sawed, and then drying them in the sun; this is found a great advantage to them; but neither this, nor any thing else, can prevent their shrinking. And it has been recommended to lay boards, planks, &c. in some pool or running stream for a few days, to extract the sap from them, and afterwards to dry them in the sun or air; by this means, it is said, they will be preserved from chopping, casting, or cleaving; but against shrinking there is no remedy. Mr. Evelyn particularly recommends this method for fir. See **HARDENING of Timber**.

The seasoning of timber by fire is the best way of all, for piles and other pieces that are to stand under the earth, or water. The Venetians first found out this method, and the way by which they do it is this: they put the piece to be seasoned into a strong and violent flame; in this they continually turn it round by means of an engine, and take it out when it is every way covered with a black coaly crust; by this means the internal part of the wood is so hardened, that neither earth nor water can damage it for a long time afterwards. This method is practised in many places for seasoning the posts for paling of parks, &c. and has this to recommend it, that in the very oldest ruins we have ever been acquainted with, there have been discovered many times pieces of charcoal, all of which have been found uninjured, though buried in the earth for ever so many ages. This method of charring timber is practised in many parts of England, and has been much recommended, both as to economy and effect.

For this purpose, all that is necessary is to light a fire upon the ground, which shall be surrounded with a wall built with loose bricks or stones, and then, when the pieces of timber are laid across the walls, to turn them round carefully so as to present every part to the action of the fire in succession; and when the whole surface, to the depth of three quarters of an inch or an inch, is converted to charcoal, they will be sufficiently prepared. While burning, they should have a temporary covering of boughs or other fuel to preserve them from the action of the atmosphere, which would be apt to convert part of the wood into ashes. See Parkes's *Essays*, vol. ii. See also **CHARRING of Posts**.

An ingenious friend of the editor objects to this practice. The opinion that *paint* is a preservative of wood is almost universal. Nevertheless, we shall shew it to be not only erroneous, but that in most cases the use of paint accelerates the destruction of every species of wood to which it is applied.

The decay of wood is occasioned by *internal*, not external moisture, and this only when it becomes stagnant. As long as there is a free circulation, no decay takes place. Stop the circulation, and if there be any moisture whatever in the wood, stagnation commences, putrescence ensues, and the destruction will proceed with an activity in proportion to the quantity and close confinement of the internal moisture. When wood is thoroughly painted on every side, it is evident that the moisture within it is completely *sealed up*, and which necessarily becoming stagnant, the decomposition and decay of the timber immediately commence. Hence it is clear, that painting of wood, as above stated, in every case, except only when it is entirely free from moisture, or as it is called *thoroughly seasoned*, must be as effectual a method as any that can be devised for accelerating its decay.

Wood that is painted only on one side, will, *ceteris paribus*, last as long again as that which is painted on both sides. And that which is not painted at all will be most durable. Experiment will prove this to be the fact, whether the wood is exposed to the weather or not.

TIMBER.

It is seldom that we meet with either a scaffold-pole or a scaffold-board (such as are used by builders) that is rotten, although they are of fir, and are alternately wet and dry, and descend from father to son for several generations. The reason is, *they are never painted.*

Examine any old building, and it will be found that no part of the wood or timber is in a sound state, excepting that which has escaped the painter's brush. The wainscot, doors, windows, &c. will be found to be rotten, when the floors and stairs, although alternately wet and dry from periodical washing, are perfectly sound, *because* they have never been painted.

It is a common practice in London to cover the basement floors with painted oil-cloth; and it is astonishing to see how soon, in these cases, the floors are rotten, and which is called the dry rot, but which is never once suspected to be the stoppage of circulation by the use of the oil-cloth. Were carpets substituted for the painted cloths, no such effect would take place.

The dry rot in buildings, and particularly in the *navy*, is comparatively a modern disease, and has very much increased since the pernicious practice of painting has become so general. The ancient city of Chester, where so much timber was introduced into the outsides of the buildings, and which is now black with age, but never painted, is a striking illustration of this theory. The same may be remarked of the villages at a distance from the metropolis, where the outside wood-work of the buildings, such as doors, windows, window-shutters, weather-boarding, &c. which have never been painted, are nevertheless sound, and yet some of them so ancient as to defy all enquiry as to their age. How different this from the gentlemen's houses near London or other great towns, where the gates, posts, rails, and pallisades are kept constantly *well painted*, but are seldom found to last longer than ten or a dozen years at most!

Paint indeed conceals from the eye the destruction which it occasions; and our readers will doubtless by this time begin to suspect their former opinions of it to be erroneous. We shall therefore only mention two other instances, which came under our own observation, to shew that wood never ought to be painted, except for the purpose of ornament.

A few years ago, some old houses were pulled down near the Monument in London. Several of the principal timbers were so scorched and burnt on the outside, that an enquiry took place as to the cause of it; and it was clearly ascertained, that the timbers in question must have been preserved from the ruins of the great fire of London in 1666, so that this wood must now be much more than 150 years old; yet the writer of this article lately saw that same fir-timber sawed out into deals, and again used as new stuff, being to all appearance as found as ever. The only perceptible difference was in the colour, which was darker than deals generally are.

The other instance referred to is the late old Jewry chapel in London. When that building was taken down, the pews, which were of oak, and the seats, which were deal (but never had been painted) were found to be in so perfect a state of soundness, that they were removed to the new building in Jewin-street, and where there is no doubt they will remain as long as the building itself, although those said deal seats are known to be considerably more than one hundred years old.

The most effectual method of preserving timber from decay is to char it; but when the purpose to which it is to be applied will not admit of that operation, the next best

method is to wash it over with charcoal and water, similar to white-washing. Either of these methods will certainly preserve it from the dry rot, charcoal being the greatest antiputrescent known, and no moisture within the influence of its action will become putrid or decomposed, and we have already shewn that this must take place before wood will perish. It may be further observed, that vegetation cannot take place where charcoal or charring is used, and the dry rot is always accompanied with that species of vegetation called *fungi*, and this fungus never occurs till decomposition or decay has begun.

When boarded floors are to be laid upon or very near the ground, it should be strewn over with dry ashes, and the joists and underside of the boards either charred or payed over with charcoal-wash, as before directed. The same should be done with the side of the wainscot next the walls.

As painting is indispensable from the fashion of the times, to doors, window-shutters, wainscot, &c. it would be well to have them painted once over in the carpenter's shop when the stuff is perfectly dry, and finished afterward in the building for which they are prepared.

If the best seasoned stuff be put up *unpainted* in a new building, the quantity of moisture it will imbibe from the brick-work, plaster, &c. before it can be painted, will defeat all former care of well seasoning.

As to fashies, mahogany is unquestionably the cheapest article they can be made of; for deal, when painted only a few times, will have cost more than the difference of price of that very superior wood, both as to look and durability. Air that is stagnant is equally pernicious as stagnant moisture. When it is in that state, it soon becomes decomposed, and the hydrogen gas fixing upon wood, ropes, paper, and other vegetable substances, quickly brings on their destruction. Ventilation, and the use of charcoal, are the best preventives.

The above hints will be sufficient to guide the intelligent workman in all other cases.

Though it does not properly belong to this article, it may not be amiss to mention, that these observations are quite inapplicable to the preservation of iron. Iron decays from the effect of *external* moisture, and the action of the atmosphere upon its surface, which produces oxydation, and which is the sole cause of its decay. This is only to be prevented *by painting.*

TIMBER, Preserving of. When boards, &c. are dried, seasoned, and fixed in their places, care is to be taken to defend and preserve them; to which the smearing of them with linseed-oil, tar, or the like oleaginous matter, contributes very much.

The ancients advise the smoke-drying of all instruments made of wood, by hanging them up in the chimnies where wood-fires are used. The whole benefit arising from this seems to be, that the oil of the burnt wood enters, as it ascends in the smoke, into the pores of that which is proposed to be preserved.

The Dutch preserve their gates, portcullices, draw-bridges, sluices, &c. by coating them over with a mixture of pitch and tar, on which they strew small pieces of cockle and other shells, beaten almost to powder, and mixed with sea-sand, which encrusts and arms them wonderfully against all assaults of wind and weather.

Timber felled before the sap is perfectly at rest, is very subject to the worms; to prevent or cure which, Mr. Evelyn gives us the following secret, as most approved: Put common sulphur into a cucurbit, with as much aquafortis

TIMBER.

as will cover it three fingers deep; distil it to a dryness, and let it have two or three rectifications.

Lay the sulphur remaining at bottom on a marble, or in a glass, and, with the oil it dissolves into, anoint the timber.

This, he adds, not only infallibly prevents or cures the worminess, but preserves all kinds of woods, and even many other things, as ropes, nets, and masts, from putrefaction, either in air, water, or snow.

For such as would go a shorter way to work, two or three anointings with linseed-oil may do very well.

As to the chaps, or clefts, green timber is liable to after working, and which is a very great defect in many fine buildings, they are closed by anointing, suppling, and soaking it with the fat of beef-broth, twice or thrice repeated.—Some carpenters use grease and saw-dust mingled for the same purpose. But the former method is excellent. Mortimer's Husbandry, vol. ii. p. 104.

TIMBER, *Strength of*. See **STRENGTH of Materials**, and **BEAM**.

TIMBER, *Crooked, Growth of*, the means of raising and providing bent or twisted timber of different sorts for the purpose of ship-building and many other uses. It has been noticed by Mr. Loudon, that the form of the larch timber-tree is unsuitable for some of the purposes of naval architecture; and that to render it more proper and suitable for such uses, cutting or pruning it has been advised by some; and, what is still less practicable, shading it, by others: but that when its mode of growth is well considered, it will be found that neither of these methods would prove effectual. The former could not succeed, it is supposed, because in the larch and fir-tribe one stem constantly takes the lead; and that in this stem alone is contained the timber. The latter, or shade, might, it is thought, produce a crooked enough stem; but that in regard to strength, or timber produce, it would evidently be so deficient, as to be totally unfit for naval architecture. In consequence of which, he has recommended the plan of bending the young trees as preferable to every other practice; and as this mode may, at some future period, perhaps be deemed of public importance, he has given a few remarks concerning the method that should be adopted and employed in the business.

It is said that, in the first place, supposing a timber plantation or wood to be planted in regular rows, fifteen feet apart, and the same distance in the row; and grown from fifteen to twenty years; in bending or rendering the trees crooked, begin with the first row, and let every other tree be bent down in different degrees, and tied to the intermediate ones which remain erect, or be fastened to the ground. After the trees have had the growth of seven or eight years longer in that situation or position, they may be bent backwards, so as to have somewhat the form of the letter S, the tops or leading shoots rising directly upwards again from the upper bends, and the bent trees be either tied to themselves between the bent parts, to keep them in their proper bent positions, or to the trees on the sides, or to any of the trees which surround them, as may be found to be most convenient and necessary. When the ropes have held the trees in these situations or positions for a few more years, they will have received, and retained, in some measure, the above crooked appearance; which is a form that will afford knee and other pieces, which are of great use in ship-building, and which always, it is said, bear a higher price than any other form of even oak-timber. Some trees need, however, it is thought, only be bent gently on one side, and others a little more so. This variation in the inclination of the trees, with those which should be left erect,

would, it is supposed, serve to produce and afford proper shelter for the whole timber plantations to which they might belong, according to the uses or purposes for which they are intended, or to the form which is most in demand. This plan is certainly thought worthy of a trial; and there is no great reason to doubt its success; for the practice of bending trees is not new; as it was advised by Evelyn, and practised by the Romans in Virgil's time.

It is probable, too, that some other sorts of timber-trees may be grown in this way with advantage.

It is suggested, that in planting the larch for this, or any other purpose, a careful attention should be had to the choice of a proper soil, as when the tree is in one which is not too rich, it reaches a large size, and soon arrives at maturity; and that it is obvious, that if the above method were adopted, the timber would be fit for building the largest ships fifty years after it was planted, and for building smaller vessels much sooner. And that there is abundant evidence, that it would grow to a sufficient size for this use in all the mountainous parts of the island; moreover, that the experiments which have been made by Mr. Knight, on the sap and wood of trees, as well as common observation, prove, that the circumstance of bending, especially in an open exposure, would produce a much thicker trunk and a larger quantity of timber, in a given time, than a straight tree. These circumstances, in connection with the valuable qualities of this tree as ship-timber, and the growing scarcity of that article in this country, lead the writer to suggest the propriety of devoting some extent of the national forests to the cultivation and raising of the larch as timber, either bent in different ways, or even allowed to take its natural form; as the first cost of planting and fencing in, even for five hundred acres, would not exceed 1000*l.*, and the yearly expences afterwards would be but a mere trifle. The culture of the oak, and perhaps some other timber-trees, should not, however, be neglected in the smallest degree: but when it is considered that this tree takes two or three hundred years to come to perfection, and the larch not above half a century, reflecting at the same time on the approaching scarcity of oak-timber fit for the navy, these hints and remarks may not, it is thought, be unworthy of the attention of the legislature, or from other quarters. See **TIMBER** and **TREE**.

The excellent properties of larch-timber, for the use of the navy, have been noticed by many, as those of resisting different dangerous effects. Anderson, in his Catalogue of Trees, asserts, it is said, that it does not fly in splinters by the impulse of a ball in an engagement; that no force of heat makes it flame; but that when thrown into a strong fire it consumes imperceptibly. How many accidents then, it is asked, might be prevented by a greater use of this timber, if applied in ships? Many lives are lost by the splinters of oak in naval warfare: all these would be saved to the state by having the planks of war-ships made of it. Decks of the same materials would resist fire, either accidental or designed; for although burning materials in time will force their way through a plank of larch, yet it never would spread to the adjoining plank. To be in a ship on fire at sea, is certainly, it is said, the most dreadful situation in which any person can be placed; every exertion, therefore, to prevent such calamity, is the duty of all well-wishers of their country. Beside these advantages arising from the use of the larch as timber, there is another of no small importance to a warlike and commercial nation, the saving of expence in ship-building; as by experience it is found that it lasts longer than oak under water, and worms will not touch it. Sailors are said indeed to put larch chips among their clothes; which are found by experience to prevent

TIMBER.

vermin, mould, &c. Consequently, in place of renewing ships of war every twenty or thirty years, their existence may, it is thought, be lengthened to thrice that time.

Many other interesting circumstances and facts in support of these statements may also be met with in Newton's Vitruvius, which we have not room to admit in this place.

TIMBER, Age of the Growth of, the limit to the growth and increase of wood in trees of this sort. It has been remarked by a late writer, that from the old alburnum of such trees being gradually converted into heart-wood, and being continually pressed upon by the expansive force of the new fibres, it becomes harder, denser, and at length loses altogether its vascular structure; and in a certain time obeying the common laws of dead matter, decays, decomposes, and is converted into aeriform and carbonic elements; into those principles from which it was originally formed. The decay of the heart-wood would consequently seem to constitute the great limit to the age and size of timber or trees of that kind. This is more liable to take place in some cases than in others. The age of growth in timber-trees is, however, mostly ascertained by the rings or layers of which they are formed.

In regard to the age of the growth of the oak, the writer of the rural economy of the midland counties has remarked, that there has been lately a fall of timber in the woods there, including some large timber-trees. That he counted the rings of one which was found at the butt: the number, as nearly as he could ascertain it, was two hundred. But those of the last forty or fifty years' growth were so thin, he could not count them with certainty; though with sufficient accuracy upon which to ground the calculations given below. The girth of this tree, in the girding place, was nine feet, the diameter of which was something more than thirty-four inches. And the estimated growth, in this part, was thirty inches diameter during the first hundred and fifty years, and four inches (two inches thick) in the last fifty years. The length of the stem was twenty-two feet. The contents of the whole were one hundred and ten feet of timber. Those of the first hundred and fifty years' growth, eighty-five feet; leaving twenty-five feet for the growth of the last fifty years. It is therefore observed, that although the increase of diameter had been comparatively small during the last fifty years, the increase of timber had been nearly as great as in the first stages.

But supposing, it is said, that this tree had been taken down at one hundred and fifty years old, it would, at 2s. a foot, have produced 8*l.* 10*s.*, the interest of which would have amounted, in the course of fifty years, to more than 20*l.*; beside the use of the land during that time: whereas the tree, at that rate, is now worth only 1*l.* These calculations and inferences are not, however, it is said, intended to excite a spirit of felling timber prematurely, or at too early an age, a spirit which is already too prevalent; but to endeavour to decide on the most proper age of growth for its being cut down; it being an incontrovertible fact, that, in point of utility, public and private, the fault of suffering timber to stand to too great an age, is infinitely greater than that of cutting it down before it has attained its full growth or age. In the latter case, it is said, there is no waste; the interest of money, and the succeeding shoots, or the use of the land, stand against the loss of growth of timber. But, in the former, the principal, interest, after-wood, and the use of the land, are all thrown away: so that the community, as well as the proprietors, are losers by the management. In the one case, cutting part before it be fit, may save other trees which are more fully grown; but, in the other, the whole is lost. Leaving, it is said, the pre-

servation and management of ship-timber to those to whom it properly belongs, it does not follow that, because it is wrong to suffer timber to stand to waste, it is right to take it down before it be of a proper age, or sufficiently grown, for the purpose of ship-building. It is not over-grown, but stout-growing timber which is fit for that use. Timber is seldom cut down prematurely, or at too early an age, but by the necessitous; or by those who have only a temporary possession in their respective estates. And what argument, it is asked, can prevail with this class of proprietors? Another class, and it is trusted by much the largest, is composed of those who, considering their timber merely as a profitable part of their several estates, take it down whenever it becomes full-grown, and a fair opportunity offers. And a third class of this sort of proprietors consists of those who, through false pride, false fear, or false economy, suffer their timber to stand until it be over-grown: and if the writer have any other motive for making known the above minutes on the ages of timber-trees, than that of recording facts, it is the desire of placing in its proper light, the improvident management of this class of timber proprietors; and, at the same time, to endeavour to form just ideas of a subject, which has not, hitherto, been brought before the public; but which is pre-eminently entitled to public notice and discussion.

It is additionally stated, that this matter having been rendered, in a considerable degree, familiar to the writer by many years' observation and practice, he may here set down what appears to him the proper ages of growth for cutting down the four following species or sorts of timber.

1. Poplar, from thirty to fifty years old.
2. Elm, from fifty to a hundred.
3. Ash, from fifty to a hundred.
4. Oak, from one to two hundred.

But it is said that it very much depends on situation, and on the soil and subsoil in which timber-trees are rooted. On dry absorbent soils, the oak and the elm, at least, are observed to go off much sooner than in cooler more retentive situations. And in a wood, on a dry loam, with a rocky subsoil, the oak was found going fast to decay at two hundred years old; while in another, in a cooler situation, it was found, but unprofitable, at that age; and in a third, perhaps a still cooler spot, it was found, profitable, and wearing every appearance of being in a fit state of growth for being taken down at the age of a hundred and fifty years. These three woods were those of Merevale, Bagot-park, and Statfold, in the midland districts of this country.

A full knowledge of the age of growth in timber-trees is a matter of great utility and advantage to the proprietors of wooded lands.

TIMBER, Marking of, the putting of such marks upon timber-trees, or large falls of timber, as may be necessary to distinguish them in felling, and which are of a proper age and growth for being taken down. It is usually performed by means of an instrument of the compasses kind, by which a circle, with a number, or some other particular sort of mark, is formed on the tree. It is of great use and advantage in felling and disposing of timber, to have this business executed in a careful and judicious manner. See **TIMBER.**

TIMBER, Measuring of. See **MENSURATION** and **SLIDING-RULE.**

For finding the area of a board or plank, the rule is simple and easy; which is that of multiplying the length by the mean breadth. If the board is tapering, the breadths at the two ends should be added together, and half the sum will be the mean breadth. The method by the sliding-rule is too obvious to need being mentioned.

TIMBER.

TIMBER-Carriage, that sort of wheel-carriage which is contrived and constructed for the purpose of conveying heavy and other timber. Carriages for this use are formed in a strong firm manner, but in different methods, according to circumstances, and the nature of the timber to be drawn. They are sometimes made with four wheels, but much more frequently only with two. They have occasionally shafts too, but are more often constructed with a pole merely.

These carriages, the writer of the rural economy of Norfolk remarks, are in that district, as in most other places, of two kinds; the four-wheeled sort of carriage, provincially "*a drag*;" and the pair of wheels, provincially "*a gill*." The last is most in use. The construction of the gill of this county is, it is said, similar to that of the timber-wheels of most other counties; namely, a pair of tall wheels, with a crooked axle-tree, surmounted by a block; to which axle is fixed a pair of shafts, or sometimes a single pole only. But it is noticed, that the method of using them there, is different from that which has been observed in other places; where the only use they are put to is to raise the butt-end of a large timber to be drawn a short distance; the top-end being suffered to drag behind upon the ground, to the great injury of the turf, or the road upon which it is drawn.

In the above county, however, a large stick of timber, or perhaps three or four smaller ones, are, it is observed, entirely slung to the axle; so that, in drawing, no part of them whatever touches the ground; the top-end or part being generally drawn foremost, and the end towards the horses always the heaviest.

It is stated, that the method of taking up a piece of timber is this: the horses being taken off, the wheels are run, by hand, astride the timber to be slung, until the axle is judged to be a few inches behind the balance-point: or, which is better, a chain is first put round the timber, and the wheels run up to it. It is difficult to ascertain the exact place of fixing the chain by the eye; but nevertheless, a person accustomed to sling timber in this manner, will, it is said, come very near the truth. The chain hooked, and the axle brought into its proper situation, the shafts, or pole, are thrown back in the usual manner; the chain carried over the block, brought round the pole, its ends made fast, and the shafts or pole brought down again by the horses; by which means the timber is lifted from the ground, and suspended to the axle. If the required point of balance be not hit upon at the first trial, the shafts are suffered to rise again, the chain is unhooked, and shifted to its proper situation: the shafts being then again pulled down, are bound by an iron trace, or small chain, close down to the timber; while another small chain or trace is fastened round the foremost end to hook the horses to; the team drawing by the timber, and not by the pole or shafts.

It is supposed, that the utility of having a super-balance of weight forward is two-fold: if the piece were slung in exact equilibrium, it would, upon the road, be in perpetual vibration; thereby rendering the pull unsteady, and extremely inconvenient to the horses: whereas, by throwing the balance forward, the traces are commonly kept down constantly in their proper place, and the pull becomes uniform: if, however, too much weight were to be thrown forward, the draught of the horses would not raise the point of the timber from the ground; the friction would, of course, increase the draught, and the road be at the same time hurt. It therefore follows, it is said, that the proper weight to be thrown forward is such as is enough to prevent a vibration, but not so much as to prevent the point from being raised from the road by the draught of the horses

upon level ground. And that the other advantage, by a super-balance forward, is gained in going down a hill; in which case, the draught not being wanted, the point, of course, falls to the ground, and serves as a pall to regulate the motion of the carriage: if the super-balance alone be not sufficient to check the too great rapidity of the motion, the driver adds, it is said, his own weight. Likewise, if, in ascending a hill, the balance be lost; he, in like manner, seats himself upon the fore-part of the load, thereby keeping it down to its proper level.

It is added, that this method of conveying timber may, it is possible, be in use in other districts; but the writer has not seen it practised any where except in the above county: and that it is known to be an excellent, but not a common mode of practice.

It is of great utility and convenience for timber proprietors and dealers to be always provided with good carriages of this sort.

TIMBER Hedge-Row, such trees of this kind as are raised and grown in the lines and rows of the hedges. It has been long a disputed point among the writers on agriculture, and which is not yet fully decided, whether it be admissible or not to have trees of this sort in the directions of the hedge-rows: some strongly contending for its utility, on the grounds of the shelter, shade, and timber afforded by the practice; while others as strongly oppose it, on the score of the injury which it does to the crops and the hedges underneath the trees, as well as the obstruction which it affords in working the land, when in the tillage state. However, in many situations and cases, there can be no doubt of the advantage of having timber-trees of the hedge-row kind, when under proper and suitable management.

It has been well observed by an able writer on the means of improving the rural objects and practices of the country, that although a few trees growing in a hedge, when considered singly, may have little effect, and be of no great value or consequence; yet that a number of hedge-rows, all properly interspersed with timber-trees, will completely change the appearance of a hilly country or district, improve its climate, and yield a considerable quantity of timber to the owners of the lands. The consideration of the matter must, of course, it is thought, be of great importance to the landed interest of some parts of the island, especially those in the more northern or mountainous districts of the kingdom. What is necessary to be said on this subject here, may consequently be introduced under the heads of the *nature* of the lands where timber of the hedge-row kind may be raised and grown without injury to the farmer; and the *species* or sort of trees which is most proper to be raised in such cases. In regard to the *interest* of the farmer, the lands which are the most evidently and suitably adapted for the growth of hedge-row timber-trees are all those which are naked and much exposed, and which are kept for the most part under pasturage; and in so far as the beauty of a country or district, the improvement of its climate, and the health of its inhabitants, are concerned, the hedge-rows of the rising-grounds alone should be occupied by trees, except a few in the vallies, by the sides of public roads or rivers, to form fore-grounds to the rest of the country or district; and a few near houses or villages to group with them, and afford a richness to their appearance. In low rich vallies between mountains, which are kept in perpetual aration, the hedge-rows should not be taken up by timber-trees of this sort. But a country or district wholly level, as many of the counties and districts in the southern parts of the kingdom are, may sometimes have the hedge-rows partially set with trees, without doing any great injury to the farmer;

TIMBER.

farmer; while, if properly managed, it may vary the country, and improve its climate. In such levels, the hedges should, however, be kept very low, and the trees be trained erect with single stems, and few lateral arms or boughs near the surface; or, as is done in some places, the width of an ordinary ridge may be left on each side of the hedge, to be kept in perpetual pasture, which prevents the corn from being so much injured by the trees, and is a great ornament to a farm. This last mode is, however, not without its disadvantages, as it is liable to disseminate and fill the adjoining tillage-lands with the seeds of noxious and hurtful weeds. However, in cases where the whole farm is to be kept in perpetual pasture, the trees may often be allowed to extend their branches, and the hedges may be kept high or low, at pleasure. Moist or clayey soils should never, when under perpetual aration, be set with hedge-row trees; and indeed, before they are put into such rows any where, or in any case, a full consideration and estimate should, it is said, be made of their effect on the annual rent of the land, on their intrinsic value, on the climate, and on the appearance of the country.

The writer of the Yorkshire rural economy considers this an interesting subject to the proprietors of inclosed estates. The old inclosed parts of that neighbourhood, when seen at some distance, have, it is said, the appearance of woodlands; the inclosures being mostly narrow, and full of hedge-row timber. The age, on a par, is about 50 years. In half a century more, the value of the timber of some parts of it, if suffered to stand, will probably be equal to the value of the land; a circumstance, it is supposed, of no small import to the owner. But the detriment to the occupier requires to be considered. In this county, it seems, it is said, to be a general idea, founded perhaps on experience, that lofty hedge-rows are beneficial to grafs-land; increasing its productiveness by their warmth, and giving shelter and shade to pasturing-stock. The roots even of the ash are considered as inoffensive to land in the state of grafs; in which state the grounds, thus loaded with hedges and timber-trees, are almost universally kept. Indeed it would be impossible, in their present state, to occupy them as arable land. They are entire inclosures, every foot of the areas of which must necessarily be occupied by ashen roots; nevertheless they give an ample supply of hay and pasturage; one to two tons of hay an acre: and, in many of them, three acres will afford sufficient pasturage for two cows of the largest size. The rent from thirty to forty shillings an acre. Strong evidence this, it is said, that the roots of the ash are not very hurtful to grafs-land.

It is evident, however, it is thought, that the oak, when suffered to thrust its low spreading head into the inclosure, is injurious to the herbage beneath it; that the leaves of the ash are very detrimental to after-grafs; and that the hedges are annually receiving irreparable damage: no general plan of training up the trees with tall stems having, it is believed, in any instance, been adopted, so as to prevent, in any complete manner, such effects.

On these accounts it is concluded, that the advantages accruing from the planting of timber-trees in the hedge-rows of inclosed common fields, of a foil and lying in a situation adapted to grafs, are far superior to any disadvantages arising therefrom, even where they have been suffered to grow in a state of almost total neglect. And that land which has lain open, and which has been kept in a state of aration during a succession of ages, is equally productive of grafs and trees. That it is generally good management to let it lie in grafs for some length of time, after inclosure. Besides, that in the above neighbourhood, it is evident to

common observation, that trees flourish with unusual vigour in newly-inclosed lands of arable fields; and that their injury to grafs-land is inconsiderable, when compared with the value of the timber which they produce. The low spreading heads of the oak, and the leaves of the ash, appear to be the chief inconveniencies of these two sorts of trees to grafs-land.

But as an alternancy of corn and grafs is, it is thought, generally eligible on lands which our ancestors have made choice of for common fields; and as the roots of the ash are not only obstructions to the plough, but the general nature of the plants is, in a singular degree, inimical to corn; it is consequently necessary to eradicate the ash from the hedge-rows, before the land be again broken up for arable; or to preclude this tedious operation, in the first instance, by planting oak in its stead. It is conceived that the head of the oak may be raised to such a height, as not to be injurious to grafs, nor to the hedge, while yet in a youthful state, even though it were suffered to run up to its natural height.

The roots of the fir tribe of trees afford equal obstruction to the plough; they are, of course, equally objectionable in the hedge-rows of arable fields.

It is suggested, in conclusion, that whenever the inclosures are broken up for corn, the hedges should, in common good management, be headed down, and kept in a dwarfish state; in which case, tall stemmed oaks would be a valuable source of timber, without being, in almost any degree, injurious either to the hedges, or to the corn growing under them. But the training of young oaks, and the general management of hedge-row timber, cannot, with any degree of prudence, be left to a mere occupier. When intended as nurseries of timber, they should, it is conceived, be under the immediate direction and management of a person proper for the purpose. See POLLARD and FENCE.

The writer of the Gloucester Report on Agriculture, however, remarks, that the practice of planting timber-trees at all in hedges is liable to objections; for if the tree be left to take its natural growth, which is the best mode of raising it for good timber, the lower fence is ruined by its shade and drippings; or if they are cut up and shreded into naked poles, or pollarded for the sake of the lop or fire-wood, the timber is injured, and the beauty of the tree destroyed. A better plan is, it is thought, to assign certain spots on estates for the purpose of raising timber-trees only. This would eventually be no waste of land, because the grafs or corn growing near the hedges, which are filled with timber or fruit-trees, is worth little or nothing. In the small inclosures at the angles of a field, for instance, the trees might take their natural growth; and this would be more rapid, in consequence of their being planted in clumps, and protected. If, however, the old mode of planting in hedge-rows should be continued, the ash may be the best for the purpose. The timber, in some respects, is superior to elm, and, in various cases, useful where that cannot be applied. In durability it almost rivals the oak, and its growth is improved by being kept to a single stem, the only mode of treatment in which trees should be admitted into hedge-rows at all, but which few other trees will bear. The oak and beech particularly, when so large as to become heart-wood, appear to be greatly hurt by the loss of their side branches; the immediate effect of which is a retardation of growth: and it is said, that the oak will not thrive for ten years after this operation; and of the elm, that it is injured, though apparently suffering less. It is, however, to be noticed, that the finest and soundest trees are those which have been most left to their natural growth.

TIMBER.

In what relates to the most proper sorts of trees for putting in hedge-rows, in different cases, it may be further noticed, that when the soil is good and deep, according to the first of the above writers, the oak and Scotch elm may be the most suitable; in strong land, the ash; in poor soils, the beech, sycamore, and birch; in cases of moist soils, as meadows and such like places, the Lombardy poplar, which, besides its timber produce, forms, when in rows, a close, erect, narrow hedge, fifty or sixty feet high, in a few years. Such hedges are, however, of no very great value, whether the trees be cut low, or allowed to rise to their full height. The oak and the above sort of elm prosper better, it is said, in hedge-rows than in any other situations; their roots have a free range in the adjoining inclosures, while their tops shoot out vigorously on every side, thus often producing excellent ship-timber. More remarks of this nature may be met with in Kent's hints, and Marshal's work on planting. The beech, it is thought, is peculiarly suited for thin soils and exposed situations. When put out about ten or twelve feet asunder, it affords excellent shelter, and, at the same time, a very considerable quantity of timber. The ash and the sycamore will rise and grow erect on the most exposed upland situations, or near the sea. When put out in good soils, they should generally be trained to one stem; in which state, their timber produce is the most valuable and useful. The resinous tribe and the evergreen sorts of trees are, for the most part, improper for being set out in hedge-rows. In the different cyder districts or counties in the southern parts of the kingdom, fruit-trees are not unfrequently introduced into the hedge-rows; the practice of which might probably be advantageously had recourse to in many other districts and counties in the same part of the country, as well as in several more to the north. In many different situations they would be a valuable acquisition, without doing any injury, or taking up the more useful part of the land.

In a great number of districts and places where hedge-row timber exists, the situation is often improper, and the management wretchedly bad and negligent; in consequence of which, it has frequently become an injury to the farmer, without yielding any advantage to the proprietor. Two more glaring instances of this cannot, it is thought, be given than in the tall naked elms, and pollarded oaks, which prevail in many places in the southern parts of the island: the former, by improper lopping and cutting, are worth nothing; and the latter, by being cut over at the height of eight or ten feet, form ugly bushy-headed trees, which do great injury and mischief to the farmer, and yield nothing to the owner. In defence of such practices, it has been said, that fuel alone is the intended produce; but certainly it would be much the best method, in such cases, it is thought, to allot a space or portion by itself for the purpose of raising fuel, and devote the hedge-rows to the more important uses of producing timber. The fuel part of the land might be rented by the farmer, and the hedge-rows belong exclusively to the proprietor. Keeping each sort of woody collection strictly characteristic of its kind is, it is thought, as beneficial in the raising of trees, as the division of labour is in political economy. There is a great number of situations and places in the more northern parts of the island, as well perhaps as in some others, where hedge-row timber might be cultivated to the advantage of both the landlord and tenant, and the great ornament of the country. Suppose, it is said, an estate of two thousand acres, divided into fields of ten acres each, and the hedge-rows planted with trees at fifteen feet apart; this would be above the rate of eight trees upon the acre, or sixteen thousand trees

in the hedges only. At the end of thirty years, if well managed, they would be worth from twenty to forty shillings each; but say only thirty shillings each, this would be sixteen thousand pounds: a very considerable sum, it is said, for a proprietor of only two thousand acres to receive every thirty years, above the annual rent of his estate.

These hints and observations place the utility and importance of hedge-row planting, where it can be done with propriety, in a striking point of view.

TIMBER-Inspector, a term applied to a person who is appointed to inspect and examine the states of timber-woods, plantations, and forests in any district or place. It has been suggested by the writer of the corrected account of the state of agriculture in the county of Devon, that, as it is evident that the timber in that county is wasting in a very alarming manner, (and the same is the case in many other timber-wooded districts,) it is necessary that an ordinance should be made, that in future no timber-tree should be cut down, or legally exposed for sale, without having the mark of the timber-inspector of the district affixed to it, and a certificate accompanying it. This sort of officer should, it is thought, be appointed and paid by government, and to whom annual returns should be made of all matters and circumstances appertaining to his duty, which should also extend to the inspection and examination of all young timber-plantations, &c.: where it should be required that he should not only see that a certain number of young trees is planted for every timber-tree that is cut down, but that the same young trees and plantations are well fenced in and protected. That on his observing such timber woodland fences insufficient for their safety, and their owners persistently unmindful of the report he has made, he should be empowered to order and direct the necessary repairs to be done, and to be enabled to recover the amount of such expence, by levying an immediate distress upon the moveables on the premises of the parties.

It would unquestionably be of great utility and advantage in increasing the quantity, and improving the quality of timber, to have such inspectors in all timber-wooded districts of every description.

TIMBER-Plantation, that sort which is made simply for the purpose of raising and producing timber. Several points and circumstances are necessary to be attended to in the performance of this business, in order to render such plantations the most expeditiously and abundantly productive, such as the proper choice of soil, situation, and exposure, as well as proper fencing in, thinning, training, and pruning, all of which are noticed and explained under their appropriate heads. See *PLANTATION, PLANTING, PRUNING, THINNING, TIMBER, &c.*

TIMBER-Repairs, such as are done by some sort of timber, to be cut down on estates, &c. Rough timber is mostly allowed for repairs to be done by tenants, and it is commonly the custom of this country to permit the top-wood of the trees to be taken by them for their trouble and expences in various ways with such timber. In some cases, however, the contrary mode takes place, such top-wood being charged to them at a moderate rate or price. And, in all cases, it is thought by the writer of the work on "Landed Property," that the tenant should be charged for the bark of oak-timber, which is now become scarce and of great value, he being allowed for peeling and for carriage to market, or other places.

It is advised that the neat value of the bark and the top-wood, where it is charged in these cases of repairs, should be made a fair estimate of when the timber is marked, and charged to tenants in a sum certain. By this means they become,

come, it is thought, interested in the peeling and harvesting or securing of the bark: no waste is consequently incurred through their neglect, or any unfair dealings risked; nor is there any disputable account to be settled, on the rent-day, between them and the receivers.

In the view too of enabling the acting managers, in such cases, to *select*, in the best and readiest manner, *proper* trees for the several different sorts of repairs that may, from time to time, be required, — let, it is said, the woodmen, or those who have the immediate charge of the timber of estates, be directed to note down, in going their rounds, such trees as may be faulty, and are likely to go soon to decay, or which are stunted in their growth, or too much crowded, and, in general, such as are proper to be taken down for the different uses of estates: whether for erecting or repairing buildings, or for gates or other purposes: in order that they may be able to lead or direct, without loss of time, the acting managers and the carpenters or builders of estates, with the estimates, in their hands, of the quantity and quality of the timber which is requisite to the trees most proper for any given purpose: thus preserving the *crop* of *sale* timber from unnecessary spoil, by a less discriminate choice or method of proceeding.

TIMBER, *Stick of*, a term frequently applied to any large boled or stemmed tree of the timber kind: a fine, large, perfect timber-tree. See **TIMBER** and **TREE**.

TIMBER-Trees, the wood of timber, before it be felled, particularly that of oak, &c. See **TREES**.

For the raising, planting, transplanting, pruning, &c. of timber-trees, see **SEMINARY**, **NURSERY**, **PRUNING**, and **TRANSPLANTING**.

TIMBER-Wood, a term signifying that sort of wood which is employed or designed for the raising and growth of timber, in contradistinction to that of the under-wood or coppice kinds, or such as has little or no brush-wood or under-growths in it. There are but few cases in which it is not advantageous for timber-woods to be kept pretty clear and free from most sorts of under-growths, especially where they approach near the trees. See **WOOD**.

TIMBER-Wood or Tree, Register of, the account which is necessary to be kept of the timber-wood or trees of that kind, which are growing upon the different parts of a timbered estate. The writer of a late work on "Landed Property," has advised that it should consist of all that is met with on the several divisions of an estate; setting forth the number of such trees in each of the different woods, groves, hedge-rows, and all other places, with the several species or kinds, the number which is affixed to each, and the admeasurement of each of them. Separate accounts, containing those trees of each particular division, being entered and kept; for the satisfaction and occasional use of the land-manager and the woodward. Such lists or registers are always of great utility and benefit to the proprietors of timber-wooded estates, as ascertaining their nature, state, and situation in many different respects.

TIMBER-Lode, in our *Old Writers*, a service by which tenants were to carry timber from the woods to the lord's house.

TIMBER, Bearing of. See **BEARING**.

TIMBER-Work, Casing of. See **CASING**.

TIMBER or *Timmer of Furs*, as ermines, martens, fables, and the like, denotes forty skins; of other skins, six score. *Rust*.

"Hæc civitas (sc. Cestrie) nunc reddebat de firma 45 libras et tres timbrias pellium martinarum." *LL. Edw. Conf.*

TIMBERS of Ermin, in *Heraldry*, denote the ranks or rows of ermin in noblemen's coats.

TIMBER, in *Falconry*. To *timber*, is to nestle, or make a nest, as birds of prey do.

TIMBER, Prick, in Botany. See **SPINDLE-Tree**.

TIMBERS, in *Ship-Building*, the ribs of a ship, or the incurved pieces of wood branching outward from the keel in a vertical direction, so as to give strength, figure, and solidity to the whole fabric.

One timber in a ship is composed of several pieces united into one frame, which accordingly is called by the artificers a frame of timbers. The timbers whose planes are perpendicular to the keel, are called *square-timbers*; and those which are placed obliquely on the keel, as at the extremities of a ship, are called *cant-timbers*. The foremost of those pieces on the ship's bow are called the *knuckle-timbers*; and the hindmost on the quarter, the *fashion-pieces*. See **SHIP-BUILDING**.

TIMBER and Room, or Room and Space, is the distance betwixt the moulding edges of two adjoining timbers, which must always contain the breadth of two timbers; and sometimes two or three inches between them.

TIMBO, in *Geography*, a town of Africa, on the **Grain Coast**. N. lat. 5° 28'. W. long. 9° 20'.

TIMBRE, or **TIMMER**, in *Heraldry, denotes the crest of an armory, or whatever is placed atop of the escutcheon, to distinguish the degree of nobility, either ecclesiastical or secular.*

Such as the papal tiara, cardinal's hat, the cross, mitre, coronet, mortar, and particularly the casques or helmets, which the ancients called more especially timbres, from their resembling a kind of bell without a clapper, which the French call timbre, or because they resounded like those timbres when struck. This is the opinion of Loifeau, who derives the word from the Latin, *tintinnabulum*.

TIMBREL, Tabret, or Tambour de Basque, in *Music*, is an instrument of very high antiquity; having been in use among the Hebrews, Greeks, and Romans. To the rim were hung bells or pieces of metal.

TIME is a portion or part of infinite duration. It is generally measured by motion, and chiefly by the motions of the heavenly bodies.

There is nothing perhaps of which the mind is less capable of forming a distinct idea than time, unconnected with the motions of sensible objects; and yet, on account of this connection, every one thinks it a subject with which he is familiarly acquainted, until an explanation is required.

The opinions of ancient philosophers on the subject are generally vague and contradictory. Pythagoras and Heraclitus maintained that time was a substance, but the Stoics considered it as unsubstantiated. Aristotle and the Peripatetians define time to be "a multitude of parts of motion, which pass and succeed each other in a continual flux, and have relations to each other, inasmuch as some are anterior and others posterior." Archytas defined it to be "a continued and indivisible flux of *nows* or instants."

The Epicureans considered "time as merely an object of the imagination, or an attribute given to things by the mind while contemplating them either as enduring or ceasing; as possessing a longer or shorter existence, as enjoying such existence, as having enjoyed it, or as being about to enjoy it."

Lucretius, the great poet and philosopher of this sect, defines time as follows:

"Tempus item per se non est, sed rebus ab ipsis
Consequitur sensus, transactum quid sit in ævo;
Tum, quæ res instet, quid porro deinde sequatur:
Nec per se quemquam tempus sentire fatendum est
Semotum ab rerum motu, placidâque quiete."

Lib. i. 460.

Thus

TIME.

Thus translated by Creech :

“ Time of itself is nothing, but from thought
Receives its rise, by labouring fancy wrought
From things considered, whilst we think on some
As present, some as past, or yet to come.
No thought can think on time, that's still confess,
But thinks on things in motion or at rest.”

The above opinion of Lucretius, though fancied by many of the ancients, and even by some of the moderns, does not appear to have satisfied philosophers in general. Cicero says (1 de Invent.) “*difficile est tempus definire.*” Thus also St. Austin (2 Confess. 24.) observes, “*si nemo ex me quærat quid sit tempus, scio; se quærenti explicare velim, nescio.*”

Locke seems to have considered time more profoundly than perhaps any other philosopher. The following are among his opinions on the subject. Human Underst. vol. i. ch. 14.

“The answer of a great man to one who asked him what time was, ‘*si non rogas intelligo,*’ (which amounts to this; the more I set myself to think of it, the less I understand it,) might perhaps persuade one that time, which reveals all things, is not itself to be discovered. Duration, time, and eternity, are, not without reason, thought to have something very abstruse in their nature.

“To understand time and eternity aright, we ought with attention to consider what *idea* it is we have of *duration*, and how we came by it. 'Tis evident to one who will but observe what passes in his own mind, that there is a train of ideas which constantly succeed one another in his understanding as long as he is awake. Reflection on these appearances of several ideas, one after another in our minds, is that which furnishes us with the idea of *succession*; and the distance between the appearance of any two ideas in our minds, is that which we call *duration* (which see). Having thus got the idea of duration, the next thing natural for the mind to do, is to get some *measure* of this common duration, whereby it might judge of its different lengths, and consider the distinct order wherein several things exist: without which, a great part of our knowledge would be confused, and a great part of history rendered very useless. This consideration of duration, as set out by certain periods, and marked by certain measures or epochs, is that, I think, which most properly we call *time.*”

Nearly according to the above our modern Encyclopædists define time; viz. “a succession of phenomena in the universe, or a mode of duration marked by certain periods and measures, and principally by the motions or apparent revolutions of the sun.” Others define time to be “the duration of a thing, the existence of which is not without beginning or end; which distinguishes time from eternity.”

Time is distinguished into *absolute* and *relative*.

Absolute time is considered in itself, without any relation to bodies or their motions flowing uniformly. *Relative time* is the sensible measure of any portion of duration by means of motion. As the equal and uniform flux of time does not affect our senses; and as there is nothing in this flux that can make us know immediately time itself; we must, of necessity, have recourse to some motion, by which we can determine the quantity of time, by comparing parts of time with those of space that the moving body traverses. Therefore, as we judge that times are equal, when they flow whilst a body which is in a uniform motion traverses equal spaces; so likewise we judge that times are equal, when they flow whilst the sun, moon, and the other celestial luminaries, complete their ordi-

nary revolutions, which to our senses appear uniform. See MOTION.

But as the flowing of time cannot be accelerated nor retarded; as all bodies move sometimes quicker and sometimes slower; and as there is perhaps no perfectly uniform motion in nature, except the earth's rotation on its axis, some authors are of opinion that absolute time cannot be concluded to be something really distinct from motion: for supposing for a moment the earth and the other planets have been without motion ever since the creation, does it thence follow that the course of time would have been stopped or interrupted? Would not the duration of this state of rest have been equal to the time which has elapsed since the creation?

As absolute time is a quantity which flows in a uniform manner, and which is very simple in its nature, mathematicians represent it to the imagination by the most simple sensible magnitudes, particularly by right lines and by circles, with which absolute time appears to have a great analogy in respect of succession, the similarity of parts, &c.

In fact, it is not absolutely necessary to measure time by motion; for the constant and periodical return of a thing which happens or manifests itself by intervals equally distant from each other, as, for instance, the budding of a plant, &c. may do the same thing. It is said there are people in America who reckon years by the arrival and departure of birds.

Time is usually represented by the uniform motion of a point that describes a right line. The point is the successive state, present successively at different places, and producing by its fluxion a continual succession, to which we attach the idea of time. The uniform motion of an object also measures time; for when this motion takes place, the moving body traverses, for example, one foot in the same time in which it has traversed a first foot; therefore, the duration of things that co-exist with the moving body whilst it traverses one foot being taken as one, the duration of those that will co-exist with its motion whilst it will be traversing two feet will be two, and so on; so that by this means time becomes commensurable, since we can assign the reason of one duration to another duration that we had taken for unity. Thus, in clocks, the hand moves uniformly in a circle: the twelfth part of the circumference of this circle is unity, and time is measured by this unity, by saying two hours, three hours, &c. So likewise one year is taken for one, because the revolutions of the sun in the ecliptic are equal, or nearly so, to our senses; and we make use of it to measure other durations in relation with this unity. We know the attempts made by astronomers to find a uniform motion, to enable them to measure time exactly; and this is what has been best done by means of pendulums. See PENDULUM.

There is no measure of time exactly correct. Every one has his own measure of time in the quickness or slowness with which his ideas succeed each other; and from these different degrees of quickness in different persons, or in the same person at different times, arise these modes of speaking; *I have found the time very long, or very short*; for time appears long to us, when the ideas succeed each other slowly in our mind, and *vice versa*. The measures of time are arbitrary, and may vary among different people: the only one that is universal is the present instant; and yet some deny the existence of present time, as being constantly on the wing; or, according to Horace, (Carmen XI.)

“Dum loquimur fugerit invida ætas.”

Time is indeed an inexhaustible subject for figurative and poetical allusions, and even for paradoxes. Thus, it is said

to owe its own immaterial being to the creation of material order; to have all its portions measured by the periodical motions of matter, and yet to be distinct from, and independent of, those motions for its existence, though it could not exist until they existed: also that it operates upon every thing, yet touches nothing. Many other contradictory properties might be mentioned, but such tend to darken rather than to elucidate the subject. Some philosophers have gone even so far as to deny the existence of time; for if there be no present, there cannot be any future, and the past certainly has no existence.

We now come to consider the application of mathematics to time, as connected with astronomical computations, where the subject is accurately calculated, and rendered subservient to the important purposes of measuring space, by which the longitude is determined both in the heavens and on earth.

Astronomical time is distinguished into solar or apparent time, mean time, and sidereal time.

Apparent time, also called *true solar* and *astronomical time*, is regulated by the apparent motions of the sun. *Mean* or *mean solar time*, also called *equated time*, is a mean or average of apparent time: and *sidereal time* is shewn by the diurnal revolutions of the fixed stars.

An *apparent day* is the interval between two successive transits of the sun's centre over the same meridian, which interval is subject to continual variations, owing to the eccentricity of the earth's orbit, and the obliquity of the ecliptic to the equator. These variations are computed in a table, for which see *EQUATION of Time*.

A *mean day* is the interval that would be observed between two successive transits of the sun's centre over the same meridian, if the earth's orbit were circular, and the sun always in the equinoctial. Thus the intervals or transits would be all equal, such as are shewn by a clock that goes exactly 24 hours in a day, and $365^d 5^h 48^m 48^s$ in a year. A clock thus set is said to be adjusted to mean time.

A *sidereal day* is the interval between two successive transits of a star over the same meridian; which interval is uniform, because all the fixed stars make their revolutions in equal times, owing to the uniformity of the earth's diurnal rotation on its axis.

The sidereal day is shorter than the mean solar day by $3^m 56^s.55$ sidereal time. This difference arises from the sun's apparent annual motion from west to east, which leaves the star as it were behind. Thus, if the sun and a star be observed on any day to pass the meridian at the same instant, the next day, when the star returns to the meridian, the sun will have advanced about a degree easterly (his daily portion of the ecliptic): and, as the earth's diurnal rotation on its axis is from west to east, the star will come to the meridian before the sun, inasmuch that at the end of the year it will have gained a day on the sun, that is, it will have passed the meridian 366 times, while the sun will have passed it but 365 times. Now as the sun appears to perform his revolution of 360° in a year, say, as $365^d 5^h 48^m 48^s : 360^\circ :: 1^d : 59^h 8^m.3$, which is the space the sun would describe in a day, if all the days were of an equal length; and this space reduced to time, = $3^h 56^m.55$ = the excess of a *mean day* above a *sidereal day*, in sidereal time, or $3^h 55^m.91$ in mean solar time.

It therefore appears that the earth describes about its axis an arc of $360^\circ 59^h 8^m.3$ in a *mean solar day*, and an arc of 360° in a *sidereal day*; therefore, as $360^\circ 59^h 8^m : 360^\circ :: 24^h : 23^h 56^m 4^s.09$ = the length of a sidereal day in mean

solar time, or the interval between two successive transits of a star over the same meridian.

Hence the following general rule for converting sidereal to mean time, and the contrary:

As $24^h : 23^h 56^m 4^s.09 ::$ any portion of sidereal time to its equivalent in mean time. And as $23^h 56^m 4^s.09 : 24^h ::$ any portion of mean time to its equivalent in sidereal time. Thus Tables I. and II. in our article *CHRONOMETER* are computed.

From what has been said, it is evident that apparent and mean time are the same, with respect to the length of the hour, minute, and second of each, as well as of the year; but the hour, minute, and second of sidereal time are respectively less in the above proportion. It is only the solar and mean days that differ, and this variation is marked by the times of commencement. Thus the apparent day always begins when the sun's centre is on the meridian; but the mean day commences sometimes sooner and sometimes later, as computed in the tables of the equation of time. See *EQUATION of Time*.

The *reduction of time*, that is, to turn apparent, mean, and sidereal time into each other, may be performed by the following theorems, taken from Kelly's *Spherics*, p. 208, ed. 4.

- Let A = apparent time.
 - M = mean time.
 - S = sidereal time.
 - E = the equation of time at apparent noon.
 - e = the daily difference of the equation of time.
 - R = the sun's right ascension at apparent noon.
 - r = the daily increase of the sun's right ascension.
 - N = the sun's mean right ascension at mean noon, *i. e.* the sidereal time at mean noon.
 - m = the reduction of sidereal time at the rate of $3^h 55^m.91$ for 24 hours sidereal time.
 - s = the reduction of mean to sidereal time, at the rate of $3^h 56^m.55$ for 24 hours mean time.
- And let \pm signify that addition or subtraction which is to be used according as the quantity under consideration is increasing or decreasing.
- Also let $A' = M \pm E$, as applied in case 2.

Formulæ for the Reduction of Time.

Case.	Given.	Reqd.	Solution.
1	A	M	$M = A \pm E \pm \frac{A \times e}{24}$
2	M	A	$A = A' \pm \frac{A' \times e}{24 \pm e}$
3	M	S	$S = N + \overline{M \pm s}$
4	S	M	$M = \overline{S - N - m}$
5	A	S	$S = A + \frac{A \times r}{24} + R$
6	S	A	$A = S - R - \frac{S - R \times r}{24 + r}$

TIME.

The foregoing six cases comprehend all the varieties that occur in the reduction of time; and for their numerical illustration, see our article CHRONOMETER.

For the application of time to the measurement of space and motion, see LONGITUDE and LUNAR Observations.

TIME, *Civil*, is astronomical time accommodated to civil uses, and formed and distinguished into years, months, days, and hours, with their subdivisions: the reckoning of the hours as civil to twelve twice over, is meant to mark the natural day.

TIME, in *Heathen Mythology*, was personified and deified. Saturn was usually the symbol of it. Time was represented with wings, to mark the rapidity with which it passes, and with a scythe, to signify its ravages. It was divided into several parts; the century, the generation or space of thirty years, the lustrum, the year, the seasons, the months, the days, and the hours; and each of these parts had its particular figure in men or women, according as their names were masculine or feminine; their images were used in religious ceremonies.

TIME, in *Music*, is an affection of sound, by which we denominate it *long* or *short*, with regard to its continuance in the same degree of tune.

Time and tune are the great properties of sound, on whose difference or proportions music depends: each has its several charms: where the time or duration of the notes is equal, the differences of tune alone are capable of entertaining us with endless pleasure.

And of the power of time alone, *i. e.* of the pleasures arising from the various measures of long and short, swift and slow, we have an instance in the drum, which has no difference of notes, as to tune.

Time, in music, is considered either with respect to the absolute duration of the notes, *i. e.* the duration considered in every note by itself, and measured by some external notion foreign to the music; in respect to which the composition is said to be *quick* or *slow*: or it is considered with respect to the relative quantity or proportion of the notes compared with one another. See NOTE.

The signs or characters by which the time of notes is represented, are shewn under the article CHARACTERS, in *Music*, where the names, proportions, &c. are also expressed.

A semi-breve, for instance, is marked to be equal to two minims, a minim to two crotchets, a crotchet to two quavers, and so on, still in a duplicate ratio, *i. e.* in the ratio of 2 : 1. Now where the notes respect each other thus, *i. e.* where they are in this ratio, the music is said to be in *duple*, *i. e.* *double* or *common* time.

When the several notes are triple of each other, or in the ratio 3 : 1, that is, when the semi-breve is equal to three minims, the minim to three crotchets, &c. the music is said to be in *triple* time.

To render this part as simple as possible, the proportions already stated among the notes are fixed and invariable: and to express the proportion of 3 : 1, a point (.) is added to the right side of any note, which is deemed equivalent to half of it; and by this means a pointed semi-breve, O. becomes equal to three minims, and so of the rest.

From hence arise several other ratios constituting new kinds of triple time; as 2 : 3 and 3 : 4, &c.; but these, Mr. Malcolm observes, are of no real service, and are not perceived without a painful attention. For the proportions of the times of notes, to afford us pleasure, must be such as are not difficultly perceived; on which account the only ratios fit for music, beside that of equality, are the double and triple.

TIME, *Common* or *Duple*, is of two species: the first, when every bar or measure is equal to a semi-breve, or its value in any combination of notes of a less quantity.

The second, where every bar is equal to a minim, or its value in less notes. The movements of this kind of measure are various, but there are three common distinctions; the first *slow*, signified at the beginning by the mark C; the

second *brisk*, signified by ; the third *very quick*, signi-

fied by 

But what that slow, brisk, and quick is, is very uncertain, and only to be learned by practice. The nearest measure we know of, is to make a quaver the length of the pulse of a good watch; then a crotchet will be equal to two pulses, a minim to four, and the whole measure or semi-breve to eight. This may be reputed the measure of *brisk* time; as for the *slow*, it is as long again, and the quick is only half as long.

Some propose to measure it by imagining the bar as actually divided into four crotchets, in the first kind, and so make the whole as long as one may distinctly pronounce these four words, *one, two, three, four*, all of equal length: so that the first crotchet may be applied to *one*, the second to *two*, &c. and for other notes proportionally: and this is made the brisk movement of *common* time.

The whole measure then of common time is equal to a semi-breve, or a minim; but these are variously subdivided into notes of less quantities.

Now to keep the time equal, we make use of a motion of the hand or foot, thus: knowing the true time of a crotchet, we shall suppose the measure or bar actually subdivided into four crotchets for the first species of common time; then the half measure will be two crotchets; therefore the hand or foot being up, if we put it down with the very beginning of the first note or crotchet, and then raise it with the third, and then down to begin the next measure; this is called *beating of time*.

By practice, they get a habit of making this motion very equal, and consequently of dividing the measure or bar into equal parts, up and down; as also of taking all the notes in the just proportion, so as to begin and end them precisely with the beating. In the measure of two crotchets, they beat down the first, and the second up. Some call each half of the measure in common time, *a time*; and so they call this the mode or measure of *two times*, or the *dupla* measure.

Again, some mark the measure of two crotchets with a 2 or $\frac{2}{1}$, signifying it to be equal to two notes, of which four make a semi-breve; and some mark it $\frac{2}{4}$ for quavers. Malcolm's Music, p. 385, &c.

TIME, *for Triple*. See TRIPLE-Time.

TIME-Table. See CHARACTERS, FRANCO, and Plate I*.

TIME, in *Fencing*. There are three kinds of time; that of the sword, that of the foot, and that of the whole body. All the times that are perceived out of their measure, are only to be considered as appeals, or feints, to deceive and amuse the enemy. See FENCING.

TIME, in the *Manege*, is sometimes taken for the motion of a horse, that observes measure and justness in performing a manege; and sometimes it signifies the interval between two of his motions. In the manege of a step and a leap, the horse makes by turns a corvet between two caprioles; and in that case the corvet is one time that prepares the horse for the caprioles.

The times observed in making a stop are nothing but many falcades.

TIME also signifies the effect of one of the aids; thus, we say, a good horseman disposes his horse for the effects of the heel, by beginning with one time of the legs, and never runs precipitately upon his times.

TIME of *sowing Flowers*, in *Gardening*, among florists, the period or season of exhibiting those of the finer kinds, either on the summer stages for this purpose, or in other places. For some sorts of flowers, as those of the auricula and other similar kinds, it is usually from about the latter part of April until about the beginning of May, in situations near the metropolis, in which length of period or season there are commonly about four such shows at different suitable intervals of time.

In other sorts of fine flowers, the shows are mostly somewhat later, and do not last any great length of time, as for tulips, carnations, and some other similar kinds; and there are still a few others which last differently in regard to time, or a great part of the summer season. See *SUMMER-Stage*.

TIME-Keepers, in a general sense, denote instruments adapted for measuring time. See *CHRONOMETER*.

TIME of Peace. See *PEACE*.

TIME, in *Chronology*. See *CHRONOLOGY*.

TIME, in *Grammar*. See *TENSE, PROSODY, and MEASURE*.

TIME, in *Mechanics*. See *MOTION*.

TIME, *Periodical*. See *PERIOD*.

TIME, *Equation of*. See *EQUATION*.

TIME, *Kipper*. See *KIPPER*.

TIME, *Unity of*. See *UNITY*.

TIMELFIOERD, in *Geography*, a bay of the North sea, on the coast of Norway; 32 miles W. of Romfald.

TIMEN-GUY, in *Rigging*, a rope fastened at one end to the fore-shrouds, and nailed at the other end to the anchor-stock, on the bow, to prevent the fore-sheet from entangling.

TIMENS, in *Geography*, a town of Norway, in the province of Christianland; 15 miles S. of Stavanger.

TIMERA, a town of Sweden, in the province of Medelpadia; 5 miles N. of Sundfwall.

TIMERY, a town of Hindoostan, in the Carnatic; 6 miles S. of Arcot.

TIMERYCOTTA, a town and fortrefs of Hindoostan, in Golconda; 54 miles S.E. of Hydrabad. N. lat. $15^{\circ} 20'$. E. long. $79^{\circ} 26'$.

TIMERYDURGAM, a town of Hindoostan, in Baraul; 21 miles N.N.W. of Darempoury.

TIMESQUIT, or TIMASQUIT, a town of Africa, in the country of Darah; 80 miles W. of Tafilet.

TIMETHUS, in *Ancient Geography*, a river of Sicily, the mouth of which is placed by Ptolemy between Tyndarium and Agathyrum.

TIMICI, *Abat-el-Wed*, a place in Africa, S.E. of Arfinaria, on the banks of one of the rivers which formed the Carceim; and in which are ruins.

TIMIRU, in *Geography*, a town of the island of Cuba; 20 miles W.S.W. of Villa del Principe.

TIMMER. See *TIMBER and TIMBRE*.

TIMMIA, in *Botany*, received that name from the celebrated Hedwig, in compliment to his correspondent Mr. Joachim Christian Timm, an apothecary and principal magistrate at Malchin, who published *Flora Megapolitana Prodromus*, in 1788. This makes an octavo volume, containing the names, characters, places of growth, &c. of the native plants of Mecklenburg-Schwerin, disposed according to the Linnæan system, with the abolition of the 20th, 21st,

22d, and 23d classes, and a separation of all the grasses and grafs-like plants together, into a class by themselves. The number of species is 1200, of which 501 belong to the *Cryptogamia*, the other classes being far from rich. Neither does the work contain any critical observations to compensate for the inconvenience of the above changes.—Hedw. Crypt. v. 1. 83. Sp. Musc. 176. Schreb. Gen. 761. Timm. Megapol. 234.—Class and order, *Cryptogamia Musci*. Nat. Ord. *Musci*.

Ess. Ch. Capsule ovate. Outer fringe of sixteen pointed teeth: inner membranous, with jointed teeth combined at the top. Male flowers on the same plant, axillary, stalked, bud-shaped.

The known species are two only. *T. megapolitana*, Hedw. Crypt. v. 1. 83. t. 31, found near Malchin, growing in boggy ground among *Carices*, as well as in North America: and *T. austriaca*, Hedw. Sp. Musc. 176. t. 42. f. 1—7, native of Schneeberg, a celebrated Austrian mountain. Both have the habit of *BRYUM*, or *MNIUM*; see those articles. We cannot consider *Timmia* as an admissible genus, being distinguished from *Bryum* merely by the connexion of the points of the inner fringe, like *POILLIA* of Hedwig, which the reader will find in its proper place. Under the head of *FRINGE of Mosses* we have suggested the objections to founding genera on the differences of figure in the inner fringe, which are uncertain, variable, very difficult to observe, and lead to unnatural distinctions. Characters derived from the situation of the male flowers are subject to still greater difficulties and objections.

TIMMISKAMAIN LAKE, in *Geography*, a lake of North America, in Canada. This lake gives name to a tribe of Indians near it. N. lat. $47^{\circ} 30'$. W. long. $80^{\circ} 40'$.

TIMMS, a town of North Carolina; 15 miles S.S.E. of Fayetteville.

TIMOAN, an island in the East Indian sea, inhabited by Malays: ships may obtain wood and water; the anchorage is good almost all round the island; but the inhabitants are surly and insolent. N. lat. $2^{\circ} 53'$. E. long. $104^{\circ} 25'$.

TIMOCHARIS, in *Biography*, an astronomer of Alexandria, who flourished in the third century B.C. He observed B.C. 294, on the 9th of March, four hours before midnight, a conjunction of the moon with the Spica Virginis, the star being then, according to him, 8° W. from the equinoctial point.

TIMOK, in *Geography*, a river of Servia, which rises in mount Hæmus, and runs into the Danube, 6 miles N. of Viddin.

TIMOLEON, in *Biography*, a distinguished example of patriotism and attachment to liberty, was of noble parentage, and a native of Corinth. His discriminating character was exhibited at an early age in the rescue of his brother Timophanes at a moment of danger, when he was thrown from his horse in an engagement with the Argives, and surrounded by the enemy. Timoleon flew to his aid, covered him with his shield, and after receiving many wounds, liberated his brother. This same brother, being placed by the Corinthians for the safety of their city at the head of a standing body of mercenaries, assumed the sovereignty of the state; but Timoleon, dreading the subversion of the liberty of his country by the ambition of his own brother, remonstrated against his proceedings; and, finding his own attempts for restraining him ineffectual, engaged two friends to concur with him in his efforts; but their united endeavours proving of no avail, Timoleon is said to have stood by him weeping, with his face covered, while his associates dispatched the tyrant. Such is the account of Plutarch; but Diodorus says, that Timoleon killed his brother with his own hand. This

act, however, followed by the reproaches of his friends, and by the imprecations of his mother, was the occasion of poignant distress to Timoleon; so that he withdrew from all public affairs, and for some years wandered about in the most disconsolate state, in the most gloomy recesses of his grounds, without ever approaching the city. After a retirement of twenty years, the Syracusans applied to Corinth for succour in a season of calamity, occasioned by domestic tyrants, and by the hostile preparations of the Carthaginians. The Corinthians passed a vote for granting the assistance that was requested, and Timoleon, in preference to many others who were proposed, was appointed their general. Timoleon sailed for Sicily in the year B.C. 344, with a fleet of about ten sail, and arriving, by a stratagem, in the port of Tauromenium, disembarked his army, consisting of no more than one thousand men. Success and victory attended his arms; and having become master of Syracuse, he destroyed its citadel as a nest of tyrants, and caused to be erected in its place a hall of judicature; thus intimating, that the state was now to be governed by laws, and not by arms. He also colonized the city, which had been depopulated, by an importation of Greeks, and by inviting all the fugitives to return. Timoleon at the same time extended his attention to the other cities of Sicily, reducing those inhabitants who had usurped authority to the rank of private citizens, or sending them as exiles to Corinth. He prepared likewise to resist the Carthaginians, who were sending a powerful army against the island; and with a small force, but by extraordinary displays of valour and military skill, totally defeated them. He afterwards directed his attention to the internal state of Sicily, and by the measures which he adopted, settled its inhabitants in the unmolested possession of the advantages which they enjoyed in a fertile soil and propitious climate. The Sicilians acknowledged their obligations with gratitude and respect, and considered Timoleon as the common father of the nation. Having fixed his abode in Syracuse, he sent to Corinth for his wife and family, and lived as a private citizen, respected and esteemed for his virtues. Two demagogues, however, contrived to disturb his tranquillity, and brought charges against him, which he thought unworthy of refutation, and in reference to which he merely said, "he could not sufficiently express his gratitude to the gods for allowing him to see the time when the Syracusans enjoyed the liberty of speaking what they thought proper." Whilst Greece was involved in the calamities of a civil war, and in conflicts which terminated in the loss of public liberty, Timoleon was unmolested and tranquil, in a country which he had contributed to render happy. Fortunate in all his transactions after he left Corinth, he ascribed his successes to the goddess Fortune, and dedicated to her the house in which he resided. It has been observed, that in the system of the ancients, a regard to these nominal and fictitious deities did not exclude their belief of a superintending providence: and a particular instance occurs in the history of Timoleon which would lead him to imagine that his life and its incidents were under a providential care and direction. Soon after his arrival in Sicily, two strangers were hired to assassinate him: and whilst he was sacrificing in the temple of Adranum, where he then lived, these murderers mixed in the throng, and were preparing to execute their commission. At this instant a man gave one of them a blow on the head with his sword, which laid him at his feet, and then fled to the top of a rock. The other, supposing their design had been discovered, laid hold of the altar, and intreated Timoleon to spare his life, on condition of his revealing the whole plot. The first fugitive being brought down from the rock, asserted that he had committed no crime, because the

man whom he had struck had murdered his father in the city of Leontium. Such an escape would naturally impress a mind less thoughtful than that of Timoleon.

At a late period Timoleon lost his sight, and this affliction he bore with perfect resignation: and it was alleviated to him by the assiduous attentions of the Syracusans. In his old age he was revered by the Syracusans as a father in the midst of his family: and at length terminated his life by a slight disease, in the year B.C. 335. His funeral obsequies were attended by a great number of people; and when the body was placed on the pile, a herald made the following proclamation: "The people of Syracuse inter Timoleon the Corinthian, the son of Timodemus, at the expence of two hundred minæ: they honour him, moreover, through all time, with annual games, to be celebrated with music, horse-racing, and wrestling: as the man who destroyed tyrants, subdued barbarians, repopulated great cities which lay desolate, and restored to the Sicilians their laws and privileges." A monument was afterwards erected to his memory in the market-place, which being surrounded with porticoes and other public buildings, was made a place of exercise for the youth, and named the "Timoleontæum." Plut. Vit. Timol. Auc. Un. Hist.

TIMON *the Phliasian*, a disciple of Pyrrho, flourished in the time of Ptolemy Philadelphus, and lived to the age of ninety years. At an early age he visited Megara, for the advantage of Stilpo's instructions in dialectics, and afterwards removed to Elea, where he became a hearer of Pyrrho. He first professed philosophy at Chalcedon, and afterwards at Athens, where he remained till his death. He took so little pains to invite disciples to his school, that it has been said of him, that as the Scythians shot flying, Timon gained pupils by running from them. This indifference to his profession was probably owing to his love of ease and indulgence; for he was fond of rural retirement, and so much addicted to wine, that he held a successful contest with several celebrated champions in drinking. This disposition probably led him to embrace the indolent doctrine of scepticism. He seems to have treated the opinions and disputes of the philosophers with contempt, for he wrote with sarcastic humour against the whole body. His poem, entitled "Silli," often quoted by the ancients, was a keen satire, abounding with bitter invectives against men and doctrines. The remaining fragments of this poem have been industriously collected by Henry Stephens, in his "Poësis Philosophica." The public succession of professors in the Pyrrhic school terminated with Timon. Brucker by Enfield.

TIMON, SAMUEL, a writer of history, was born at Tirnau, in Hungary, and died at Cassovia, in 1736, at the age of sixty-one years. In 1693 he entered among the Jesuits, and being of feeble constitution, declined the labours of the society, and devoted himself to literary occupation, particularly to the history of his own country, in reference to which he published several works. Nouv. Dict. Hist.

TIMONEER, TIMONIER, Fr., in *Sea Language*, the helmsman, or person who manages the helm to direct the ship's course.

TIMONITIS, in *Ancient Geography*, a country of Asia, in Paphlagonia, in the vicinity of Bithynia. Strabo and Ptolemy.

TIMONVILLE, in *Geography*, a town of France, in the department of the Moselle; 9 miles W. of Morhange.

TIMOORGOODA, a town of Hindoostan, in the circle of Cicacole; 10 miles S.W. of Cicacole.

TIMOPHEEVA, a town of Russia, in the government of Irkutsk, on the Ilim; 32 miles N.W. or Vercholenksk.

TIMOR, an island in the East Indian sea, about 120

miles in length, and 33 in breadth. The Portuguese were the first Europeans who formed any kind of settlement on this island, who fled to it as a place of refuge from their enemies, the Dutch. But they were pursued by those implacable enemies, and in the year 1613 driven from Cupan, or Coupang, a town situated at the west end of the island, where the Dutch have ever since possessed and garrisoned a fort which the Portuguese had erected. The chief of the natives, or king of the island, is by the Dutch called *keyfer* (emperor). Some Portuguese reside in the north part of the island. The principal productions are sanders or sandal wood and wax, which the Dutch receive in exchange for coarse linens or piece-goods; but on the whole, the profit arising from the commerce is little more than sufficient to defray the expences, and the settlement in all probability is continued merely to keep out other nations. S. lat. $7^{\circ} 16'$ to $10^{\circ} 24'$. E. long. 124° to $126^{\circ} 21'$.

TIMOR Laut, or *Laot*, signifying in the Malacca language *sea*, an island in the East Indian sea, about 60 miles in circumference. S. lat. $7^{\circ} 25'$. E. long. $132^{\circ} 16'$.

TIMOROSO, in the *Italian Music*, intimates that the song is to be played or sung in such a manner as to express an awe or dread, either to shew respect, or to represent fear.

TIMOROUS, in the *Manege*. See **STARTING**, **SKITTING**, &c.

TIMOTEO DA URBINO, in *Biography*, whose real name was T. della Vite, was born at Urbino in 1470. He received his education as an artist under F. Francia, at Bologna, but at the age of twenty-six returned to his native city, whence he soon after went to Rome to see his countryman, Raphael, and the great works in the Vatican which had recently acquired for him so much renown. Raphael employed him in painting the Sibyls in the church of La Pace, and was satisfied of his ability in the performance: so much so, that he allowed him to retain the Cartoons. After this he returned to Urbino, and there executed several great works for the cathedral and other public buildings. He improved his style, as it was natural he should, under the tuition of his great master: and his latter productions exhibit much grace and vigour in their execution. His most esteemed works are, the Conception, in the church of the Osservanti, at Urbino; and Christ appearing to Mary Magdalen, in S. Angeli, at Cagli. He died in 1524, aged fifty-four.

TIMOTHEUS, one of the most celebrated poet-musicians of antiquity, was born at Miletus, an Ionian city of Caria, 246 B.C. He was contemporary with Philip of Macedon, and not only excelled in lyric and dithyrambic poetry, but in his performance upon the cithara. According to Pausanias, he perfected that instrument by the addition of four new strings to the seven which it had before; though Suidas says it had nine before, and that Timotheus only added two, the tenth and eleventh, to that number.

It seems necessary here to state the several claims made in favour of different persons who have been said to have extended the limits of the Greek musical scale.

Many ancient and respectable writers tell us, that before the time of Terpander, the Grecian lyre had only four strings; and, if we may believe Suidas, it remained in this state 856 years, from the time of Amphion, till Terpander added to it three new strings, which extended the musical scale to a heptachord, or seventh, and supplied the player with *two conjoint tetrachords*.

It was about 150 years after this period, that Pythagoras is said to have added an eighth string to the lyre, in order

to complete the octave, which consisted of *two disjoint tetrachords*.

These dates of the several additions to the scale, at such distant periods, though perhaps not exact, may, however, if near the truth, shew the slow progress of human knowledge, and the contented ignorance of barbarous times. But if we wonder at the music of Greece remaining so many ages in this circumscribed state, it may be asked, why that of China and Persia is not better now, though the inhabitants of those countries have long been civilized, and accustomed to luxuries and refinements.

Boethius gives a different history of the scale, and tells us that the system did not long remain in such narrow limits as a tetrachord. Choræbus, the son of Athis, or Atys, king of Lydia, added a fifth string, Hyagnis a sixth, Terpander a seventh, and, at length, Lychaon of Samos, an eighth. But all these accounts are irreconcilable with Homer's Hymn to Mercury, where the chelys, or testudo, the invention of which he ascribes to that god, is said to have had seven strings. There are many claimants among the musicians of ancient Greece, to the strings that were afterwards added to these, by which the scale, in the time of Aristoxenus, was extended to two octaves. Athenæus, more than once, speaks of the *nine-stringed* instrument; and Ion of Chios, a tragic and lyric poet and philosopher, who first recited his pieces in the 82d Olympiad, 452 B.C. mentions, in some verses quoted by Euclid, the *ten-stringed* lyre; a proof that the third conjoint tetrachord was added to the scale in his time, which was about fifty years after Pythagoras is supposed to have constructed the octachord.

The different claimants among the Greeks to the same musical discoveries, only prove that music was cultivated in different countries; and that the inhabitants of each country invented and improved their own instruments, some of which happening to resemble those of other parts of Greece, rendered it difficult for historians to avoid attributing the same invention to different persons. Thus the single flute was given to Minerva, and to Marfyas; the syrinx, or fistula, to Pan, and to Cybele; and the lyre, or cithara, to Mercury, Apollo, Amphion, Linus, and Orpheus. Indeed, the mere addition of a string or two to an instrument without a neck, was so obvious and easy, that it is scarcely possible not to conceive many people to have done it at the same time.

With respect to the number of strings on the lyre of Timotheus, the account of Pausanias and Suidas is confirmed in the famous decree against him, for which see **SENATUS-CONSULTUM**.

It appears from Suidas, that the poetical and musical compositions of Timotheus were very numerous, and of various kinds. He attributes to him nineteen nomes, or canticles, in hexameters; thirty-six proems, or preludes; eighteen dithyrambics; twenty-one hymns; the poem in praise of Diana; one panegyric; three tragedies, the Persians, Phinidas, and Laertes; to which must be added a fourth, mentioned by several ancient authors, called "Niobe," without forgetting the poem on "The Birth of Bacchus." Stephen of Byzantium makes him author of eighteen books of nomes, or airs, for the cithara, to eight thousand verses, and of a thousand *Προοίμια*, or preludes, for the nomes of the flute.

A musician so long eminent as Timotheus, must have excited great desire in young students to become his pupils; but, according to Bartholinus, he used to exact a *double price* from all such as had previously received instructions from any other master; saying, that he would rather instruct those who *knew nothing*, for *half price*, than have the trouble of *unteaching*

unteaching such as had already acquired bad habits, and an incorrect and vicious manner of playing.

Timotheus died in Macedonia, according to Suidas, at the age of ninety-seven; though the Marbles, much better authority, say at ninety; and Stephen of Byzantium fixes his death in the fourth year of the 105th Olympiad, two years before the birth of Alexander the Great; whence it appears that this Timotheus was not the famous player on the flute so much esteemed by that prince, who was animated to such a degree by his performance, as to seize his arms; and who employed him, as Athenæus informs us, together with the other great musicians of his time, at his nuptials. However, by an inattention to dates, and by forgetting that of these two musicians of the same name, the one was a Milesian, and the other a Theban, they have been hitherto almost always confounded.

TIMOTHY, a favourite disciple and companion of St. Paul, was the son of a Jewess by a Greek father, at Lystra in Isauria. He was the confidential associate and friend of St. Paul, and he addressed to him two epistles. (See EPISTLE.) According to the Roman martyrology, he was stoned to death at one of the festivals of Diana at Ephesus.

TIMOTHY Grass, in Agriculture, the common name of a grass which is said to be cultivated much in America. The seeds are said to have been carried from the state of Virginia, by Mr. Timothy Hanson, to that of North Carolina, where it is much grown, and from which circumstance it probably received its name. It is a sort of grass which thrives most in low, damp, marshy grounds; in such soils and situations, it will produce a fine turf in a short time. It is very luxuriant, grows to a considerable height, and has, in some sort, the appearance of wheat or rye, having a broad blade or leaf.

It may be noticed, that all sorts of cattle are said to be fond of it whilst in the green growing state, as well as in that of hay.

It is very productive, but coarse, and flowers late. Almost all the agriculturalists and travellers of America concur in giving this grass the highest commendations, as being the chief support of cattle wherever meadows are found. And from the inquiries made by Mr. Strickland, at the request of the Board of Agriculture, it appears to be extensively cultivated in the middle and northern states of the American union; he has frequently seen extraordinary crops of it growing as thickly as it could stand on the ground, three or four feet high, and in some instances as coarse as wheat-

straw. In this state it is cut before maturity; and as the hay in America is always well cured, however succulent it may be, at the time of cutting, horses prefer it to every other kind of hay, and thrive better upon it.

No other grasses approach it in produce; and it is stated to be particularly useful when mixed with red clover, in preventing it from falling too close to the ground. And since his return, by cultivating it in his garden he has ascertained it to be the same as the *cat's-tail* grass; but he is doubtful whether, if it were cultivated in the field, and should grow with American luxuriance, an English sun would be able to cure it with American perfection. It has, however, been said by Curtis, that it has no excellence that we are acquainted with, which the meadow fox-tail grass does not possess in an equal degree. In the trials made by the Rev. Mr. Young of keeping it closely fed down by sheep, upon a moist loam with a clayey marl bottom, the success was sufficiently encouraging to evince that it is deserving of attention; especially as its seeds may be easily procured in any quantity from America at the price of about one guinea the bushel; which, he observes, is enough, in conjunction with that of other grasses, for four or five acres of land. He thinks four pounds, the proportion for the acre as fixed by Rocque, who first introduced it into this country, are much too little; and is of opinion, that timothy is best adapted to moist loams, especially those of the peaty kinds.

It is said to be common in the dairy pastures of Cheshire, by the writer of the Agricultural Report of that county, but that, although it has been strongly recommended for cultivation, it seems by no means to merit the high character which was, at one time, given it. In moist lands or soils it grows tolerably well; but in all cases and kinds of land, it is thought much inferior to the meadow fox-tail, and the smooth-stalked meadow-grass. In a paper in the third volume of the "Transactions of the Highland Society of Scotland," the seed of this grass is put down as useful in a mixture for one crop of hay, to be succeeded by pasture, in land of the clay kind. And that, in these circumstances, late and coarse as it is, it may be beneficial in such sort of land, as it is in some degree congenial to it.

The experiments, however, lately made at Woburn Abbey, under the direction of his grace the duke of Bedford, the results of which are detailed in an appendix to a late work on "Agricultural Chemistry," place its comparative merits in the strongest and most certain point of view. It is there stated, that, at the time of flowering, from a clayey loam:

	Ounces.	Lbs.	oz.	dr.	
The produce <i>per</i> acre is	653400	0	=	40837	8 0 <i>per</i> acre.
Weight when dry of produce of same space	277695	0	=	17355	15 0
Weight lost by produce of same space in drying				23481	9 0
Weight of nutritive matter afforded by same	25523	7	=	1595	3 0
Weight of nutritive matter, lost by leaving the crop till the seed be ripe, exceeding one half of its value				2073	11 0
At the time the seed is ripe:					
Produce <i>per</i> acre	653400	0	=	40837	8 0
Weight when dry of produce of same space	310365	0	=	19397	13 0
Weight lost by produce of same space in drying				21439	11 0
Nutritive matter afforded by produce of same space	58703	14	=	3668	15 14
Latter-math, produce <i>per</i> acre	152460	0	=	9528	12 0
Affords of nutritive matter	4764	6	=	297	12 6

Sixty-four drachms of the straws, afford seven drachms of nutritive matter. The nutritive powers of the straws simply, therefore, it is said, exceed those of the leaves, in proportion of 28 to 8; and the grass at the time of flower-

ing, to that at the time the seed is ripe, as 10 to 23; and the latter-math to the grass of the flowering crop, as 8 to 10.

From the whole of these particulars, the comparative merits

merits of this grass will, it is supposed, appear to be very great; to which may be added the abundance of fine foliage which it affords early in the spring; in which respect it is inferior, it is said, to the *fertile meadow-grass* and *narrow-leaved meadow-grass* only. The value of the straws at the time the seed is ripe, exceeds that of the grass at the time of flowering, as 28 to 10; a circumstance which increases its value, it is thought, above many others: for, by this property, its valuable early foliage may be cropped, to an advanced period of the season, without injury to the crop of hay, which, in other grasses that send forth their flowering straws early in the season, would cause a loss of nearly one-half of the value of the crop, as is clearly shewn in many instances; and this property of the straws too, makes the plant peculiarly valuable for the purpose of hay.

In the smaller variety of this grass, the produce *per acre* on the same sort of land, at the time of ripening the seed; the weight when dry; the loss of weight in drying; and the nutritive matter afforded, are all very considerably less than in the above sort. In the latter-math produce on the same space, the quantity is the same as in that, but the nutritive matter afforded by it something less, as may be seen in the work referred to above.

In the bulbous-stalked species, the produce of the acre in the same kind of land, at the time of flowering; the weight when dry; that lost by the produce of the same space in drying; and the quantity of nutritive matter afforded by it, are all stated in the same work to be greatly less than in the first kind. And that this grass is inferior in many respects to that of the first sort. That it is sparingly found in meadows. And that from the number of bulbs which grow out of the straws, a greater proportion of nutritive matter might have been expected. This seems to prove, it is said, that these bulbs, in this sort of grass, do not form so valuable a part of the plant as the joints, which are so conspicuous in the first sort, the nutritive powers of which exceed those of this bulbous-stalked sort, as 8 to 28.

The qualities and useful properties of timothy grass are thus well pointed out and determined. See *PHLEUM* and *GRASS*.

TIMOU, in *Geography*, a town of Thibet; 225 miles E.S.E. of Lassa.

TIMOUR, or **TAMERLANE**, in *Biography*, a famous Oriental conqueror, was born at the village of Sebzar, in the territory of Cash, 40 miles S. of Samarcand, in the year 1336. At the time of his birth, the Khans of Cashgar, with an army of Getæ or Kalmucks, invaded Transoxiana. In 1357, Timour, having lately lost his father, collected a number of followers with a view of delivering his country; but being deserted by them, he retreated to the desert, and his army was there farther diminished by an action with the Getæ. He then wandered with his wife and seven companions, and being arrested, was kept two months in prison. Upon his liberation he swam over the rapid stream of Oxus or Jihon, and for some months led the life of a vagrant. In process of time, and on return to his native country, he was at the head of a considerable force, which enabled him to expel the Getæ from Transoxiana. After a civil war between him and his brother-in-law, the Emir Houssain, who was defeated and put to death, Timour, at a general diet held in 1370, was seated on the throne of Zagatai, at the city of Balk, and invested with the high title of Saheb Karan, or emperor of the Age; upon which he repaired to Samarcand, which became the seat of his empire. In consequence of this elevation, his ambition was directed to greater objects; and having reunited to Zagatai its

former dependencies, Karizme and Kandahar, he fixed his views on the kingdoms of Iran or Persia, which were then occupied by various usurpers. Having reduced to submission Ibrahim, the prince of Sherwan, and secured the conquest of Fars or Persia proper, by the defeat and death of Shah Manfour, its prince, and the extirpation of his male progeny, he advanced from Shiraz to the Persian gulf, and exacted from the rich city of Ormuz an annual tribute. He then proceeded as a conqueror through the whole course of the Tigris and Euphrates from their sources to their mouths, entered Edessa, and reduced the Christians in the mountains of Georgia. Retaliating upon the Getæ the invasion of his country, he passed the Sihon, and subdued the kingdom of Cashgar. In his several expeditions he penetrated as far as 480 leagues to the N.E. of Samarcand, and his emirs crossed the Irtisch into Siberia, another scene of his adventures and conquests near Kipzak or Western Tartary. Having entertained at his court Toctamish, a fugitive prince of that country, he sent him back with an army which established him in the Mogul empire of the North. Toctamish, however, after a reign of ten years, unmindful of his obligations to his benefactor, entered Persia with a mighty army, passed the Sihon, burnt the palaces of Timour, and reduced him to the necessity of contending for his capital and empire. But his triumph was of no long duration; for Toctamish was defeated, Kipzak was invaded, and Toctamish was again encountered and routed. This pursuit led Timour to the tributary provinces of Russia, and a duke of the reigning family was made captive on the ruins of Yeletz, his capital. Timour then marched southwards, and having pillaged, reduced to ashes the commercial city of Azoph, and also those of Serai and Astrachan. Under the influence of that ambition which was his ruling principle, he determined, in 1398, on the invasion of Hindoostan, and taking advantage of the rebellion against the weak Sultan Mahmood, he led an army of 92 squadrons, each of 1000 horse, and found great difficulty in traversing one of the snowy ridges between the Jihon and the Indus. Having crossed the Indus at Attock, he entered the Panjab, and formed a junction with one of his grandsons, who had reduced Moultan. He then advanced towards Delhi, and having overthrown the army of Mahmood with its elephants, took possession of the capital, which he desolated by pillage and massacre. In this part of his march he manifested his religious zeal, by destroying infidels and idolaters without mercy, and having passed the Ganges about 100 miles N.E. of Delhi, he slaughtered a great number of the Guebres, or fire-worshippers. Whilst he was thus engaged, he received intelligence of the disturbances that had occurred on the confines of Georgia and Anatolia, of the revolt of the Christians, and of the ambitious projects of the Turkish sultan Bajazet. Having issued orders to his commanders, he hastened back to Samarcand; and after a short interval of repose, he proclaimed a seven years' expedition to the western parts of Asia. In the year 1400 he began with the Georgian Christians, and soon reduced them to the alternative of tribute or the Koran, and to prisoners he allowed no other choice but death or abjuring their religion. Returning from this warfare, he gave audience to the ambassadors of Bajazet, and after some time spent in mutual complaints and menaces, Timour laid siege to Siwas or Sebaste, on the borders of Anatolia, which he took and destroyed, burying alive with savage cruelty the Armenian garrison of 4000 men. He then invaded Syria, and advanced towards Aleppo, from which issued a numerous and well-appointed force to engage his army, the front of which was covered by a line of Indian elephants, carrying turrets filled with archers

and Greek fire. This formidable host threw the Syrians into disorder, and they fled with precipitation into the city, whither the enemy accompanied them. Timour soon became master of this opulent capital. While the streets were streaming with blood and resounding with cries, the conqueror held a theological conference with the doctors of the law; protesting, towards the close of his harangue, that he was not a man of blood, that he was not the aggressor in any of his wars, and that his enemies brought upon themselves the calamities they suffered: at the same time his soldiers were piling up a certain tale of heads of the enemy, in conformity to his orders, which, according to his custom, were afterwards piled up in columns and pyramids. From Aleppo, Timour proceeded to Balbeck, which he took, and then advanced towards Damascus. The sultan of Egypt had made great preparations for the defence of the city, and also for the assassination of the invader; but the plot of using poisoned daggers was discovered. The sultan pretended submission, and thus intended to put Timour off his guard; in the accomplishment of this artifice, the camp of Timour was suddenly attacked by the Syrian army, and thrown into disorder; but as soon as order was restored, the Syrians were repulsed, and driven to the gates of Damascus with great slaughter. The sultan in the mean while had returned to Egypt, and the city was left to make the best possible terms with the conqueror. During a truce, the soldiers broke into the city, massacred a great part of the inhabitants, and made captives of the rest, carried off a great quantity of rich plunder, and the city was reduced to ashes. Bagdad was the next place of importance to which Timour directed his views. Here Timour attended in person, and ordered a blockade; after 40 days' defence on the part of the inhabitants, a storm was commanded; and the death of some of the assailants was revenged by a massacre which produced a pyramid of 90,000 heads. The city was completely razed, with the exception of mosques, hospitals, and colleges. Timour's next object was the Ottoman empire. Having consulted the court-astrologists, and obtained a favourable answer, he put himself at the head of an almost innumerable force, and moved from the Araxes through Armenia and Anatolia, determining to carry the war to the heart of his rival's dominions. By his rapid advances, he invested Angora before Bajazet was apprized of his movement. Upon receiving this intelligence, the Ottoman hastened to its relief with a very large army. An engagement ensued, and the contest, which was very sanguinary, was at length decided by the defeat and capture of the Turkish emperor. This battle was fought in July 1402. Bourfa, Nice, and Smyrna were successively captured with the same circumstances of cruelty that marked the progress of Timour's arms.

Timour's conquests were extended from the Irtisch and Volga to the Persian gulf, and from the Ganges to the Archipelago; and beyond these limits his name was a sound of terror. Several princes purchased his favour by tribute, or by extraordinary tokens of respect. His want of shipping prevented his entrance into Europe. From his various expeditions, Timour did not return to Samarcand until the summer of 1404. In that capital, he displayed his magnificence and power in dispensing rewards and punishments, attending to the complaints of his people, erecting palaces and temples, and giving audience to ambassadors from Egypt, Arabia, India, Tartary, Russia, and Spain. Although he had professed satisfaction with the extent of his empire, yet he indulged a project of ambition of very great magnitude, which was that of the conquest of China. His preparations for this grand expedition were proportioned to its magni-

tude: 200,000 veteran soldiers were mustered, and they were furnished with means for conveying necessaries over the deserts which separate Samarcand from Peking. The aged emperor mounted his horse in the winter season, crossed the Sihon on the ice, and advanced to the distance of 300 miles from his capital; but at the camp of Otrar he was seized with a fever, which fatigue, and the imprudent use of iced water, soon rendered mortal. He was not unapprized of his danger; and having summoned round him his empresses and principal emirs, he declared his grandson Mehemet Jehan Ghir his universal heir and successor, and exacted an oath of obedience to him. He thus expired April 1st, 1405, in the 70th year of his age, and the 35th from his elevation to the throne of Zagatai. He left 53 descendants, and his posterity are to this day invested with the title of the Mogul emperors, although the power and dominions have passed into other hands.

His person and character are described by one of his biographers in the following terms: "Timour was tall and corpulent, with a wide forehead and large head, a pleasing countenance, and fair complexion. He had broad shoulders and strong limbs, but was maimed in one hand and lame of the right side. His eyes were full of fire; his voice was loud and commanding; his constitution hardy and vigorous; his understanding sound; and his mind firm and steadfast. In conversation he was grave and modest, and he prided himself in an attachment to truth. He delighted in reading history, and in discussing topics of science with the learned. His religion was fierce and fanatical, and he actually had, or affected to have, the superstitious reverence for omens, prophecies, fairs, and astrologers, which is general in the East. He conducted his government alone, without favourites or ministers, and its spirit was absolute and untroubled rule. It was his boast to have introduced security and order throughout his wide dominions, and he challenged the praise of a benefactor to mankind; but no conquests have been attended with greater destruction of human lives, and greater desolation of flourishing cities and districts, than his were; and his ambition prompted him to extend his authority beyond the possible limits of a single government. He was not, however, a mere barbarian conqueror; but, if his institutions can be relied on as genuine, had enlarged ideas of the administration of a great empire." The "Institutions of Timour" have been made known in Europe by two translations from a Persian version: one in English by major Davy and professor White, Oxford, 1783; and the other in French, by M. Langles, Paris, 1787. Mod. Univer. Hist. Gibbon's Rom. Emp. Gen. Biog.

TIMOURKENG, or *Fortress of Iron*, in *Geography*, a town of Thibet; 60 miles W.N.W. of Latac.

TIMPALU; a town on the W. coast of the island of Celebes. N. lat. $0^{\circ} 16'$. E. long. $119^{\circ} 44'$.

TIMPANO, Ital., a kettle-drum. See **TYMPANUM** and **TYMBALLES**.

TIMPFE, or **TYMPFE**, in *Coinage*, an old silver coin of Poland. The *tympfe*, or *tympfen*, was reckoned at eighteen groschen, and the florins were valued at thirty groschen.

TIMURCOUGH, in *Geography*, a town of Thibet; 54 miles W.N.W. of Lahdach. N. lat. $35^{\circ} 12'$. E. long. $77^{\circ} 12'$.

TIMUS, in *Ancient Geography*, a town of Asia Minor, destroyed by an earthquake.

TIMYRA, a town of Asia, in Isauria.

TIN, *Stannum*, *Jupiter*, a whitish metal, softer, less elastic, and less sonorous, than any other metal, excepting lead. In the Chaldee language, ܕܝܢ , *tin*, signifies *slime, mud, or dirt*;
and

TIN.

and when the Phœnicians came into Cornwall, and saw this metal in its ancient slimy state, they called it "the mud;" and hence, some have said, the name *tin*, in Cornu-British *stean*, is derived. Some of the ancients called it *plumbum album*; white lead, probably to distinguish it from common lead; not knowing that it was radically another metal.

This metal, denominated *κασσίτερος*; by the Greeks, and *stannum* by the Latins, seems to have been known from the most remote ages. It is mentioned by Moses; see Numb. xxxi. chap. 22. It was transported to the East from Spain and Britain by the Phœnicians, with which nations they are said to have carried on a lucrative commerce. Homer mentions it; and by Aristotle, the epithet *Κελτικόν*, or *Celtic*, is applied to it, indicating plainly the country from which it was procured. See *Tin-Trade of Britain*.

Tin-Stone, in *Mineralogy*, is the most common ore of tin, and is nearly a pure oxyd of that metal. The colour is brown, which passes from a blackish-brown to black, and from a red-brown to yellowish and greenish-white. It occurs crystallized and amorphous, and in grains and rolled pieces, varying from the magnitude of a grain of sand to that of an egg, or larger. The primitive form of the crystal is a flat octohedron: the angles are $112^{\circ} 10'$ and $67^{\circ} 50'$. The figure of the crystals is seldom perfect; sometimes a rectangular prism is interposed between the pyramids that form the octohedron. The edges and summits of the crystals are frequently bevelled or truncated, from which a great variety of secondary forms is derived. The crystals are also frequently united, forming compound crystals or macles: indeed, so numerous are the secondary crystals of tin, that more than one hundred and eighty forms of single crystals have been observed, besides the compound crystals, of which there is a considerable variety. The surface of the crystals is commonly smooth and splendid, but is sometimes streaked. The structure is laminar, but the laminae are rarely visible. The fracture is uneven and imperfectly conchoidal, with a more or less shining and resinous lustre. When the laminar structure is displayed, the lustre is highly splendid. The crystals are semi-transparent or opaque, the darker colours being opaque, the lighter sometimes nearly transparent; and the intermediate shades are only translucent, or translucent at the edges. The streak is a greyish-white. Tin-stone is hard, scarcely yielding to the knife, and giving sparks with steel. It is brittle and heavy. The specific gravity varies from 6.759 to 6.970.

Before the blowpipe it decrepitates, and becomes paler; when finely pounded and mixed with borax, it is reducible on charcoal to the metallic state.

Tin-stone contains the following constituent parts, according to Klaproth.

	From Altonon.	Schlackenwald.
Tin	77.50	75.
Oxygen	21.50	24.50
Iron	0.25	0.50
Silex	0.75	

Some analyses of tin-stone give from two to three per cent. of alumine. The tin-stone of Cornwall, dressed in the common manner, is reckoned rich if it yield 65 per cent. of tin. Tin-stone may be distinguished from *wolfram* by its superior hardness, as it gives sparks with steel; but wolfram yields easily to the knife. The powder of tin-stone is a greyish-white, that of wolfram a reddish-brown. It is distinguished from *blende* by its superior hardness, and its not emitting a sulphurous odour when pounded. By its greater specific gravity and lustre, it may be distinguished from *garnet*; and from *schorl*, by its colour, lustre, form, and higher

specific gravity. This ore occurs in veins and beds, and disseminated in granite rocks. The veins intersect rocks of granite, gneiss, mica-slate, and slate: tin-stone occurs also in alluvial soil in the districts that contain tin-veins. See *Stream-Tin*.

Wood-tin is a species of tin-stone, or oxyd of tin, found with stream-tin in rolled pieces, which are wedge-shaped or reniform, and sometimes globular. The structure is divergently fibrous, with concentric laminae; and from the supposed resemblance to the transverse section of fine-grained wood, it received its name. The colour is commonly hair-brown or wood-brown, passing into yellowish-grey. The lustre is glimmering or silky. It is opaque, hard, and brittle: the specific gravity is 6.450. It is infusible before the blowpipe, but is changed to a brownish-red colour. When strongly heated in a charcoal crucible, it yields about 75 per cent. of metallic tin. The constituent parts are, according to Vauquelin,

Oxyd of tin	-	91
Oxyd of iron	-	9

In Cornwall, this ore is almost always found with stream-tin, and never in veins: it is said, however, to have been recently met with in cellular quartz, but in very minute pieces. It is one of the most common ores of tin in Mexico, and occurs in veins that traverse a porphyritic trap, and also in alluvial depositions. In some wood-tin, there is a small, black, smooth globule, from which, as from a centre, the fibres diverge: this has received the name of *bird's-eye tin*. Wood-tin, in its structure and mode of formation, probably bears a near analogy to the kidney-shaped hematite iron-ore.

Bell-metal Ore, Tin Pyrites, or Sulphuret of Tin, is an extremely rare ore of this metal, being found only in Cornwall, at Huel rock, in a vein accompanied with sulphuret of zinc and iron. Its colour is steel-grey, passing into yellowish-white: it has a metallic lustre, and granular uneven fracture: it yields easily to the knife, and is brittle. The specific gravity is 4.350. It fuses into a black slag before the blowpipe, exhaling at the time a sulphurous odour. It communicates a yellow or green colour to borax. The constituent parts differ in different specimens; according to Klaproth, they are as under:

Tin	-	34	26.50
Copper	-	36	30.
Iron	-	3	12.
Sulphur	-	25	30.50
Earthy matter	-	2	
		100	99

Klaproth observes, that the darker varieties of this ore are considerably poorer in tin than the lighter, but the proportion of iron increases.

Analysis of the Ores of Tin.—The analyses in the *dry way* were made by Klaproth in charcoal crucibles in the following manner, in which the results were always found to be constant. The ore was broken, and well cleaned from the matrix. One hundred grains were introduced into the cavity of a charcoal crucible, closing its orifice with a stopper of charcoal. The charcoal crucible was then fitted close into one of baked clay, and placed upon the forge-hearth before the nozzle of the bellows. The contents in the charcoal crucible were reduced to the metallic state by exposing it to a strong blast for half an hour. The button of metallic tin produced was a little blackish on the sides, and

and its surface coated with a greenish crust. From one hundred grains of Bohemian tin-stone, seventy-two grains and a half of tin were produced. Wood-tin and stream-tin were treated in a similar manner. Brown tin-stone, exposed to a porcelain fire in a clay crucible, formed a clear dense glass, greenish-grey in the middle, but of a bright yellow on the sides and top. The interior of the vessel was glazed, of a milk-white, and overlaid with many small groups of needle-shaped crystals of a light-brown colour. The inner surface of the lid was lined with similar crystals.

Analysis of Tin-Stone in the humid way.—To Klaproth we are indebted for the discovery of a simple and effectual mode of analysing tin-stone in the humid way. Boil 100 grains of this ore, finely pounded, with a solution of 600 grains of caustic potash. Evaporate to dryness, and then ignite the mass moderately for half an hour. Add boiling water, which dissolves the principal part of the mass, and the residue must again be ignited with six times its weight of caustic potash, and dissolved in water, as before. Add this to the last solution, and saturate the whole with muriatic acid, which will throw down an oxyd of tin. Let this be re-dissolved by an additional quantity of muriatic acid, and precipitated again by carbonate of soda; when lixiviated, and dried in a gentle heat, it acquires the form of bright-yellowish transparent lumps. This precipitate must be finely powdered, and once more dissolved in muriatic acid, assisted by a gentle heat. The insoluble part consists of filix. Dilute the solution, which is colourless, with from two to three parts of water, and introduce a stick of zinc, round which the tin will collect in a metallic state in the form of delicate dendritic laminæ. Scrape off the tin, wash, dry, and fuse it under a cover of tallow in a capsule placed on charcoal. A button of fine metallic tin will remain at the bottom, the weight of which, deducted from that of the ore, indicates the proportion of oxygen.

Analysis of Bell-metal Ore, or Tin Pyrites.—To two drachms of finely powdered ore, add one ounce of muriatic acid, and half an ounce of nitric acid: this will dissolve the greater portion of the metallic part without heat, but a gentle heat must be applied to dissolve the whole. The sulphur will float on the surface of the solution, and must be separated by filtration. To the solution add carbonate of potash, which produces a greenish precipitate; let this be re-dissolved in diluted muriatic acid, and introduce a cylinder of pure tin, the weight of which is to be previously ascertained. By this means the copper will be separated in a metallic state. The cylinder of tin must now be carefully weighed, and the quantity which it has lost must be noted, and a cylinder of zinc must be introduced into the foregoing solution: this will separate all the tin, which must be melted with tallow and weighed. Deduct the quantity of tin which was lost by the cylinder, and the remainder will be the quantity of tin from the ore, held in the solution.

The sulphur separated by the first filtration must be ignited, and the unconsumed residue, dissolved in nitro-muriatic acid, must be added to the solution, in order to obtain the whole of the contents. The undissolved part will be the siliceous matrix.

The copper may be briskly digested in nitric acid, which will leave behind a minute portion of oxyd of tin, and ascertain the precise quantity of pure copper contained in the ore.

The method of getting, preparing, &c. the tin in the Cornish mines, much the best and most considerable in the world, is given us in the Philosophical Transactions, Abr. vol. ii. p. 569, &c. and more distinctly and fully in Pryce's Mineralogy.

The working of the tin-mines is very hard and difficult, not only by reason of the great depth which the veins descend to, even as low as sixty fathoms; but also because the rocks, through which passages are frequently cut, are extremely hard. Nor is the soft shaking earth found in the tin-mines much less inconvenient to the workmen, both by reason of the fetid, malignant vapours it exhales, and of the current of water often met with in them: these disadvantages often render it impracticable for the workmen to hold it above four hours together.

The existence of native tin has been always doubted, and till of late absolutely denied by all mineralogists, both ancient and modern: however, Mr. Borlase, in his Natural History of Cornwall, p. 185, suggested, that its existence was far from being improbable; but he afterwards discovered three specimens of this metal, native or pure, of which he presented an account to the Royal Society. Mr. Mendes da Costa made several experiments on one of these specimens, with a view of proving that it was really tin; from which he infers, that it is perfectly ductile and malleable; and being bent between the teeth, gives the same crackling noise as tin always does: in an open fire it melts easily, calcines on the surface, and smokes; but forced in a stronger fire with borax, it detonates with small phosphorescent sparks, which is a property of pure tin; and it is only corroded to a white calx in spirit of nitre, and oil of tartar *per deliquium* being added to the solution, none of it was precipitated: whence he concludes, that it was pure tin. Philos. Transf. vol. lvi. art. 7. 39. Native tin is also said to have been found in Saxony and Malacca.

The ores of tin may be generally classed into shoad or shode, stream, and bal or mine tin. The shoad is disjunct, and scattered to some distance from its parent lode, and is pebbly or smoothly angular, of various sizes, from half an ounce to some pounds weight. See SHOAD.

Stream-tin ore is the same as shoad, but smaller sized, &c. See STREAM-Tin and STREAMING.

Bal or mine tin-ore often rises very rich; and instances frequently occur, in which it has been discovered in the richest and purest state imaginable. This kind of rich ore consists of the blackest grains or crystals, and is usually found at a moderate depth, or within the day-side of forty fathoms.

When the tin-ore is raised, or dug and drawn out of the mine, and laid by the shaft, it is first *spalled*, as the process is termed, which consists in breaking it into smaller fragments, and separating it from the worthless parts. When the best parts are sorted, they are divided into heaps by a hand-barrow, containing a sack and a half, or eighteen gallons. Each of these shares, called *doles*, being turned over, equally levelled and mixed, is then divided with a shovel into two equal parts; and after being bruised by large sledges to the size of a hazel-nut, is equally levelled and divided into four parts: the bruising and divisions are repeated at pleasure, till the quantity designed for sampling is well mixed, and made as fine as common sand. To make a rough guess, or coarse essay, the sampler takes a handful of it, and washes it on a shovel, till the impure parts are carried off by the water, and the more solid and heavy particles, that are left behind, are bruised with a sledge on the shovel, till the whole assumes the appearance of mud. This is again washed, and by a peculiar motion the metallic particles are collected together on the fore-part of the shovel. By repeating these bruising, washings, and motions, it becomes clean black tin, fit for the smelting-furnace. This is called a *wan*, (probably from the French *avant*, *scramost*,) as it is thrown upon the point of the shovel by the dexterity

of the sample trier. After the tin is thus cleaned, it is dried; and if there be as much black tin as will cover a shilling, or equal to the weight of a shilling, it is called a *shilling van*, which is not rich; but if the van will cover or equal the weight of a crown-piece, it is good tin-stuff, and called a *crown van*. The shilling van, the tanners say, will produce one hundred avoirdupois weight of block or white tin; and the crown van will yield five hundred weight of block tin, for every hundred facks in measure of the respective doles from which the sample or van was taken, and so in proportion, to the richest tin-stuff, called *scove*, which is reckoned at the rate of ten thousand of white tin-metal for every hundred facks. But a better judgment may be formed from the measure of a wine half-pint, than from a handful, which is indeed accounted a half pint. When the tin, thus measured, is reduced clean, and to a proper size, by using a large shovel, and taking off the sized tin on another shovel, the van is dried in a shovel upon the fire, and then weighed by pennyweights and grains; and for every pennyweight and a half the van weighs, the produce will be one hundred weight of black tin for every hundred facks of tin-stuff; and for three pennyweights, two hundred weight, &c. in the same proportion; and if it be tin worth ten for twenty, or one for two, then the tin-stuff is valued at five hundred weight of block or white tin for every hundred facks: if it be worth twelve for twenty, the stuff is valued at six hundred weight of white tin a hundred; or if it be worth only eight for twenty, it is only valued at four hundred weight of white tin a hundred, &c. This black tin is rather of a liver colour, though called black in contradistinction from white tin, or the metal produced from this black ore: it is very heavy, and may in general be computed to hold one-half clean metal, and some of it will produce thirteen, or even fourteen parts in twenty; whence the mode of expressing so much white tin for twenty of black tin, *i. e.* eight for twenty, ten for twenty, twelve for twenty, &c. Thus, if the van of one hundred facks of tin-stuff weighs six pennyweights, being four hundred weight of black tin at twelve for twenty, the white tin or metal must be two hundred weight one quarter sixteen pounds.

In this method of sampling, the tanners form a near conjecture of the quantity of white tin which their doles of tin-stuff will produce at the smelting-house, when it is dressed, and brought into black tin. But if the black tin is combined with any bad mixture, as of mock-lead, copper, or mundic, after the van is bruised fine and washed, they lay the shovel over the fire, and burn the black tin, stirring it continually, till it has done smoaking: they then wash it again on the shovel, and thus the heterogeneous matter, becoming light by being burnt, is carried off by the water: for when black tin is calcined or burnt, it still retains its specific gravity; but copper, lead, and other crude minerals, become much lighter by torrefaction, and are easily separated from the tin by water. In the dressing and management of tin by stamping, &c. there are obtained two sorts of black tin, *viz.* the crop and rough, or the crop and leavings of tin. The first is the prime tin: immediately separable from the baser parts by its superior weight and richness. The latter is that which is carried off, and mixed with the lighter earthy parts, by being under size, and, therefore, more easily carried off by the water.

The tin-stuff, after this previous preparation and adjustment, is carried to the stamping-mill, in order to be dressed or pounded.

This operation of pounding in the stamping-mill is essential to the complete separation of the ore from the matrix,

through which it is disseminated. If full of slime, it is thrown into a pit, called a *buddle*, to wash away the earthy matter, and render the stamping more free, without choaking the grates. The ore is shovelled into a kind of sloping canal of timber, called the *pasi*, whence it slides by its own weight, and the assistance of a small stream of water, into the box where the lifters work: the lifters are raised by a water-wheel, and are armed at the bottom with large masses of iron, weighing nearly two hundred weight each: these pound or stamp the ore sufficiently to enable it to pass through the holes of an iron grate fixed at one end of the box. To assist its pulverization, a rill of water keeps it constantly wet, and it is carried by a small gutter into the fire-pit, where it makes its first deposition; the lighter particles running forward with the water into the middle pit, then into a third, where what is called the *slime* settles. (See *Dressing of ORES*, and *BUDDLE*.) From these pits the ore is carried to the *keeve*, which is a large vat containing water; in which it is farther purified by an operation termed *packing*, and which consists in beating the upper part of the contents with mallets for some minutes, by which the lighter particles are kept suspended, whilst the tin-ore, from its great specific gravity, subsides. The waste is skimmed and laid by, to be again buddled, under the name of the *skimpings*. The tin is sifted through a copper-bottom sieve into another keeve of water, by which the gravelly waste still remaining is separated from the clean tin; and the tin that runs through the sieve, if it requires no farther buddling, may be cleaned by repeatedly tossing and packing it as before. If it be necessary to buddle it again after it is sifted, let it be buddled and distributed in three parts, *viz.* the crop or purest, the crease or next in purity, and the hind-crease or tail, which is the most impure. The crop is to be cleaned by tossing, &c. and the crease must be buddled again, and out of this must be reserved as much as may be cleaned by tossing and packing. The remainder must be cleaned by an operation called *dilleughing*, from *dilleugh*, to let go, or send away. A dilleugh is a large fine hair-sieve, which the dresser holds in a keeve one-third full of water, into which the tin is thrown by a shovelful at a time, and which is shook so as to put the tin into motion: one side of this dilleugh is dipped in water, and raised again in such a manner, that the waste may run over, which is laid aside to mix with the skimpings, to make the samples of low value, called the *rough* (or *row*) tin. This usually undergoes another operation, in which, by a rill of water passing over the buddle in which it is placed, it is farther cleaned, and then dilleughed, so as to be fit to mix with the crop-tin.

Upon the same mechanical principle of separation, the tinner is capable of estimating the value of a sample of ore. For this purpose, the pounded tin-ore, or tin-stuff, as it is called, is placed on a shovel and washed under a stream, till the impure earthy parts are carried off by the water from its sides, when, by a particular and dexterous motion, not easily described, all the metallic particles are collected together on the fore-part of the shovel: this operation is called *wanning*, which we have already described.

When the tin-ore is contaminated with the different pyritous ores of copper, arsenic, and iron, it is first roasted in a burning-house, and then washed in water, by which means the tin, which is heavy, is easily separated.

By this process, as at present conducted in Cornwall, a considerable quantity of copper is lost; for being converted into sulphate of copper, which is soluble in water, it is lost by washing; whereas, if the roasted ore were suffered to remain in a close pit for a few days, and the water drawn off

TIN.

off into another pit, the copper might be separated by iron in a metallic state.

The leavings of tin, consisting of the slime and tails, *i. e.* of tin-mud and tin-gravel, are dressed by a particular kind of apparatus, for the construction and use of which, we must refer to Pryce's *Min. Corn.* p. 226, &c.

Each stamping-mill, which has constant work and water, will employ one man and five boys; and one hundred sacks are carried, stamped, and dressed, in the space of a few days, at the average rate of about four-pence *per* sack, or one guinea and a half *per* hundred.

When the tin-ore is dressed, it is divided into as many shares as there are lords and proprietors.

The next operation pertaining to tin-ore, or black tin, is that of *smelting* it. The Phœnicians, who traded to Cornwall for tin in the earlier ages, probably conducted this process by digging a hole in the ground, and throwing the ore on a charcoal fire, which perhaps was excited by a bellows. But having no idea of confining the fire, and directing its force on the substance to be smelted, they made no use of furnaces, either simple or reverberatory. Charcoal was long used in the operation of smelting, till at length necessity suggested the introduction of pit-coal; and in the second year of queen Anne, a patent was granted for smelting black tin with fossile coal in iron furnaces. The invention of reverberatory-furnaces built with brick, stone, sand, lime, and clay, soon followed this discovery; the form of which, being simple, has admitted of little improvement to the present time. The charge for one of the tin smelting-furnaces is from five to six hundred weight of black tin, well mixed with a tenth or twelfth or eighth its weight of culm, which is a species of coal from South Wales, that is very free from sulphur. The furnace is charged through a hole in its side with a shovel, and the tin levelled over the bottom with an iron rake or paddle. The apertures are then closed, and the fire raised to a very great strength, in which state it is left for four or five hours, when the door is taken off, and the whole charge well stirred together. The state of the metal is examined, and more culm thrown in if necessary; the furnace is again closed, and the fire kept up till the end of about six hours from its receiving the charge; when it is again examined, and if proper, it is then tapped, and the metal let out into a fixed basin made of clay, and large enough to hold somewhat more than the metal of the charge. The scoria in the bottom of the furnace is raked out at the mouth into a small pit made for this purpose, where it generally forms itself into a cake. When cold, it is carried to the stamping-mill, in order to separate the globules of melted tin disseminated through the scoria or slag. This, being broke by hammers to the size of goose-eggs, is put into the first stamping-mill, and passed through small iron bars; by which means the *pillion* (for so all tin recovered out of the slags is called) of the larger size is taken out and prevented from waste by too much stamping. The refuse of this first stamping is put into other stamping-mills of a second, third, or even fourth size. Of the pillion, separated from the scoria, all the rough or grainy parts are considered as metals, and refined accordingly, by being smelted without any flux, and the produce of this smelting refined, with the tin first tapped.

The tin in the basin, or float (as it is called), as soon as it comes down to a moderate heat, is laded out into the moulds, in slabs or pigs of about three-fourths of a hundred weight.

The method of smelting in Saxony and Bohemia, does not differ greatly from that practised in Cornwall. When the ore has been roasted it is washed upon tables, to separate

the oxyd of iron and the oxyd of copper, which are lighter than tin-ore. At Alt-Saint-John, the oxyd of tin is mixed with the black oxyd of iron: this is separated by a powerful magnet, which is drawn over the table. That the powdered oxyd of tin may not be blown away by the blast of the furnace, it is previously moistened with water; but as the flame always carries away a part of the ore, a chamber is constructed about the middle of the chimney, made of wood lined with clay, where the powdered ore that has been driven up by the flame is deposited.

The next process is that of *refining*. The furnace having, by the side of the small float now described, a larger one capable of holding twenty, or more blocks, is for this purpose suffered to cool to a certain degree, and then charged full with the slabs just mentioned, the tap-hole being kept open, so that as the tin melts in this moderate fire, it makes its exit through it into the float; where, while running out, it is frequently stirred and tossed by a ladleful at a time held arm-high, letting it fall in a stream into the mass of metal, when the scum which arises is taken off. While the metal already put into the furnace is melting, more is added, so as to be just enough to fill the float with good tin: and this, after being tossed and skimmed as before, and suffered to cool to a proper temper, is carried in iron ladles to moulds holding generally somewhat above three hundred weight (then denominated *block-tin*), where they are marked as the smelters chuse with their house mark, which may be a pelican, plume of feathers, stag, or horse, by laying brass or iron stamps, in the face of the blocks while the tin is in a fluid state, and yet cool enough to sustain the stamping iron. The blocks are then ready to be weighed, numbered, and sent to the nearest coinage town to be coined. The privileged towns for coinage of tin, were anciently Lifkeard, Loftwithiel, Truro, and Helston: but soon after the Restoration, Penzance was added to the number; in which last place there is every quarter more tin coined than in the towns of Lifkeard, Loftwithiel, and Helston, for a whole year. When the tin is brought to be coined, the assay-master's deputy assays it by cutting off with a chissel and hammer a piece of one of the lower corners of the block, about a pound weight, partly by cutting and partly by breaking, in order to prove the roughness and firmness of the metal. If it is a pure good tin, the face of the block is stamped with the duchy seal, which stamp is a permit for the owner to sell, and at the same time an assurance that the tin so marked has been examined and found merchantable. The stamping of this impression by a hammer is *coining* the tin, and the man who does it is called the *hammer-man*. The duchy seal is argent, a lion rampant gules, crowned or, within a border garnished with bezants.

The drossy part remaining in the furnace is by an increasing fire wholly melted, which is then tapped into the small float, where the tin subsiding, and the dross rising to the top, the latter is taken off, and the tin laded into small slabs, as at first, to be again refined. The tin that remains in and about the scoria and dross of the last tappings, &c. is recovered by repeated smeltings, till at last, being almost entirely drained of that metal, they become what the workmen generally call *hard heads*, and esteemed of no farther value.

M. Grosse, in the Memoirs of the Academy of Sciences of Paris, has delivered a method he had invented of separating tin from lead or silver. Having tried an experiment on the scoria of metal, which contained with the tin a large quantity of silver, it seemed to him that one great step toward the separation of the silver, was the hastening of the calcination of the tin, and with this view he tried a mixture

of charcoal, saltpetre, and earth, which he put together into the coppel with the scoræ. It is easy to see that a detonation would happen from this, and this must greatly add to the force of the fire, in acting upon the scoræ, while the ferruginous matter well known to be contained in the charcoal mixed itself with the tin, and must greatly accelerate its calcination, divide its parts, and give the fire a new action over it. The consequence of this perfectly answered expectation, and recovered a large quantity of silver from the scoræ, in which the tin had before held it firmly imbedded; repeated experiments proved the truth of this observation, and it was found to be easy by this means at any time to separate silver from tin, or to purify silver without loss, by means of lead in which tin has accidentally been imbedded.

The scoræ in which tin is mixed with silver, are composed of tin half calcined, and run into an opaque vitrified substance, which forms a sort of net-work, in which the silver is confined in extremely small particles. If this is thrown into aqua fortis, the whole is dissolved: but then it requires a very strong fire to make the tin lose its metallic form; finally, if the whole is finely powdered, and then put into this menstruum, the silver only is taken up or dissolved, the tin remaining untouched at the bottom of the vessel.

The same gentleman found also a method of separating tin from silver, by means of corrosive sublimate of mercury. To conceive the manner in which this separation is effected, a piece of fine tin need only be cast into a solution of sublimate; in which case the acid of the sea-salt is seen to leave the mercury in order to fix upon the tin.

And, according to the same principle, if sublimate corrosive be added to a mixture of tin and silver, the same effect is produced, the acid affixes itself to the tin, and makes with it a butyrum joviale or butter of tin, the mercury becomes dissipated in the mean time by the action of the fire, and the silver remains pure and alone; but in this experiment, if too much corrosive sublimate be added, there is danger of losing some of the silver; since the abundant acid will prey upon and carry off a part of that metal, making a sort of luna cornea which dissipates itself in the air, or if the operation be performed in a close vessel, a butyrum lunare.

Gold may also be purified from tin in this manner, and in this there is no risk of loss, since the acid which takes up the tin has not the least power over that metal: in all these processes, however, the operator must avoid the fumes issuing from the crucible, for they are very dangerous.

These methods of separating of tin from silver are very certain and infallible, but they are too expensive to be employed in common, and in larger works.

The separating of tin from lead to be employed in the refining of silver is a matter of great importance; and this may be done in the following manner: melt the lead, and when in fusion throw into it a quantity of filings of iron, then increase the fire to a considerable degree, and the surface of the metal will be covered with a sort of scum, which is no other than the iron and tin. At this time there should be a little alkali salt thrown in, and by this means the scoræ readily separate themselves, and the pure lead remains in form of a regulus at the bottom. The same method may be used to separate tin from silver in the larger way, but it will be necessary for this purpose to add some lead, since otherwise the fusion will be very slow and difficult, and the tin will calcine without separating from the silver. This is a very easy and very cheap method, and will obviate most of the mischiefs which happen to the refiners, of which they would have much less frequent reason to complain, if they

nically examined the lead they were to employ. But if gold or silver be mixed with tin, the shortest method in small quantities is to calcine the whole very briskly, and in order to complete the vitrification and separation of the tin, to cast in a little glass of lead, which will immediately join itself with it and carry it off from the mass.

It may seem singular that iron being one of the hardest of the metals to melt, and tin being of all the easiest, they should so readily and easily unite in these experiments; but this seems to be the result of one of those natural and unexpected alliances which accident frequently discovers to us in bodies. There is one conjecture, however, that may be worthy a place in this research, which is, that all tin-ore contains a quantity of arsenic; and it is well known that iron very readily mixes with arsenic, and is employed to separate the arsenic from other ores, and a regulus may be formed of arsenic and iron. It is easy to suppose that tin is, in its metalline form, not wholly divested of the arsenic it contained when in the ore; and if this be allowed, it is no wonder that the two metals are easily brought together by the mediation of that principle. *Memoirs Acad. Scienc. Par. 1737.*

Mr. Cramer gives the practical rules of separating silver from tin, thus: Divide one centner of tin into two equal parts; put each of these into a separate test, and add to each sixteen centners of granulated lead, and one of copper; put the whole under the muffle, and make a very strong fire; the tin will be calcined immediately, and will swim upon the lead. Then diminish the fire a little, till the ashes of the tin that swim upon the surface do no longer sparkle: when you see this, add with a ladle two centners of glass of lead to each test, in such a manner that it may be spread wide over the whole surface of the rejected calx; the calx will then change its form of powder into that of glass; then increase the fire to its highest degree, stir up the whole with an iron rod made warm; and when the scorification is perfected, pour out the glass into a mould; the scoræ being separated, put both the reguluses into two coppels well heated; and into a third put sixteen centners of lead, and one of the same copper used in the process: examine all these beads after the coppelling is over; if the two first weigh exactly alike, it is a proof the process has been well performed; and subtracting the weight of the bead, separated from the third pan, from the joint weight of the other two, the remainder is the weight of the pure silver contained in the quantity of tin which was examined. *Cramer's Art of Assaying, p. 228.*

Tin is found in Europe, Asia, and America, but has not hitherto been discovered in the continent of Africa. This metal is much less generally disseminated than gold, silver, iron, copper, or lead; but where it occurs, it is most frequently in large quantities. In Asia it is found on the coast of Sumatra, and in Siam and Pegu. It is principally imported into our Indian possessions from Queda, Junkfeilon, Tavai in Lower Siam, and the island of Banca. The tin-mines of Banca are said to be of great extent; and Mr. Ellmore informs us, that no less than from forty to sixty thousand peculs of tin are furnished by these mines annually. Tin is said also to be found at a place five days' journey from Nankin in China. The Indian tin was known to the ancients. Diodorus Siculus mentions it among the productions of India. Tin-stone is found in Mexico in the state of stream-tin, and is procured from alluvial depositions by washing. It is also said to occur in Chili.

Tin-ore occurs in Saxony and Bohemia in beds, and disseminated in granite rocks; it is found also in veins in rocks of granite, gneiss, and mica-slate. Alluvial depositions of tin are also met with in these districts. The mines sometimes consist of a mass of ore formed by the junction of a multitude

TIN.

of small veins which pass through the rocks in different directions. These veins also contain topazes. Brongniart *Traité Elementaire*.

Tin is found near Monterey, in the province of Galicia in Spain, in veins which traverse granite and mica-slate. This ore has recently been discovered in small quantities in grains and crystals, in a rock of granite at Puy les Vignes, in the vicinity of St. Leonhard, in the department of Haute-Vienne in France. It occurs in veins with wolfram, arsenical pyrites, and martial arseniate of copper.

The most considerable repository of tin-ore in Europe is that of Cornwall. The greatest part of the tin consumed in Europe is procured from thence; and Camden even supposes this abundance of tin in Cornwall and Devonshire, to have given the original denomination *Britain* to the whole kingdom. In the Syriac language, *varatanac*, or *baratanac*, signifies *land of tin*; from which Bochart derives the name *Britain*. It occurs in Cornwall, both in veins and alluvial depositions, in various parts of the county. Alluvial depositions of this ore are also met with on Dart-moor, in Devonshire. The veins which contain tin intersect both granite and slate rocks; the latter are provincially called *killas*. These veins vary in width, and sometimes contain large masses of the ore. One block was raised from the mine called Polberrow, in St. Agnes, which weighed more than twelve hundred pounds, and produced more than half that weight of pure metal. Tin-stone generally occupies the upper part of veins, and is succeeded by copper-ore; but there are instances of tin occurring at the depth of two hundred fathoms. Different modifications of the forms of the crystals are peculiar to certain veins. Crystals of tin-stone are also disseminated in some of the granite rocks in the vicinity of veins: the crystals appear to occupy the place of mica. Where the tin-stone is disseminated in slate, it is generally in small strings or minute veins. See *MINE* and *VEINS*.

The workmen distinguish several kinds of tin; as *moor-tin*, which is the best sort, a fool of which weighs eighty pounds; and *mine-tin*, which is the next, the fool of it weighing about fifty-two or fifty pounds. The tin got from the soft, gravelly earth, they call *pryan-tin*, to distinguish it from that obtained from the stones, which is better by almost half. See *STREAM-Tin Ore*.

Grain-tin denotes the ore of tin that is sometimes dug very rich in the form of grains or pebbles, or else in larger pieces, composed of many such distinct grains, united in one mass, always of a black or dark rosin colour, pointed like diamonds. Grain-tin is also used to signify the purest and finest block or white tin, smelted with charcoal in the blast or blowing-house furnace, which never had any brood or foreign mixture in the mine: whereas the mine-tin is usually corrupted with some portion of mundic, or other mineral, and is always smelted with a bituminous fire, which communicates a harsh sulphurous quality to the metal. Grain-tin is peculiarly produced from stream-work, and is worth several shillings *per* hundred more than mine-tin. See *STREAMING*.

See on this article Macquer's *Chem. Dict.* art. *Tin*; and Pryce's *Mineralogia Cornubiensis*, fol. 1778.

There is a curiosity in the Cornish mines, which is this: that in digging at the depth of forty or fifty fathoms, they frequently meet with large timber, still entire.

Childrey, in his *Natural History*, goes back as far as the deluge to place them there; but, without having recourse to so great antiquity, they who believe that the mines, when exhausted of their ore, or mineral matter, renew and fill again in course of time, will soon solve the difficulty, by supposing

that, in the first working of these mines, these timbers had been let down to serve as props and pillars.

But there are other people who will think this renewal of the mines itself a difficulty as great as the former. However, what the former author adds, *viz.* that in some places in the mines they likewise find pick-axes, &c. with wooden shafts, as also brass nails, and that even a medal of Domitian has been found in one, seems to countenance the opinion.

For the use of tin in the composition of pewter, see *PEWTER*.

TIN-Trade of Britain. That tin was procured from Britain in a very early age, appears probable from the concurrent testimony of the most ancient historians. The Phœnicians are said by Strabo to have passed the pillars of Hercules, now the straits of Gibraltar, about twelve hundred years before Christ. At what precise period they discovered the Cassiterides, or Tin islands, is unknown, nor is their exact situation determined; but it is generally believed that the Scilly islands, and the western part of Britain, were the places from whence these early navigators procured the tin which they exported to other countries. The Phœnicians were extremely anxious to conceal from the rest of the world the true situation of the Cassiterides. Herodotus, who wrote about four hundred and fifty years before Christ, could not learn where these islands were situated; but he supposed that tin, like amber, was brought from the remotest parts of Europe. Strabo relates, that the captain of a Phœnician vessel returning from Britain seeing himself pursued by a Roman galley, chose rather to run his vessel among the rocks, than the Romans might experience the like fate, than be the means of discovering so valuable a commerce to the enemies of his country. The captain having escaped from the wreck, claimed from his country compensation for the loss of his vessel and the cargo; and it is said he was paid from the public treasury the amount of his claims. By these precautions, the Phœnicians are said to have enjoyed a profitable trade to these islands for about three hundred years. The secret was at length discovered, and the Greeks, Gauls, and Romans, came in successively for a share of this trade. The Phœcean Greeks established a colony at Marseilles five hundred and forty years before Christ; and after the destruction of Carthage, carried on this commerce: they endeavoured to conceal from the Romans their knowledge of the British isles; for on being questioned by Scipio respecting the situation and extent of those isles from whence the tin was brought, they declared that they were entirely unknown to them. The Phœnicians, in their voyage to Britain, are said to have sailed from Cadiz to the harbour of the Artabici, near Cape Finisterre, from whence, after four days' sail, they arrived in Britain. Strabo relates, that Publius Lucius Crassus having made fruitless attempts to discover whence the tin was brought, at length succeeded, and arrived in Britain. It is uncertain when this Crassus lived, and even who he was, there being two of this name; the father, who was consul of Spain, and the son, who had a command under Cæsar in Gaul.

Diodorus Siculus, who wrote during the time of Augustus, appears, from the quotation which we shall subsequently give, to have been well acquainted with the tin-trade of Britain at that period. There cannot be a doubt, that from the conquest of Britain by the Romans, to the decline of their empire in the West, they enjoyed the undisturbed possession of the British tin-trade.

What the ancient method was of preparing tin for the furnace we cannot learn, says Dr. Borlase. Polybius the historian is said to have described it; and that work is commended.

mended by Strabo, but now lost. The short description of the tin-trade given by Diodorus Siculus deserves particular attention. "These men (the tanners) manufacture the tin by working the grounds which produce it with much skill. For though the land is rocky, it has soft veins running through it, in which the tanners find the treasure, which they extract, melt, and purify. Then shaping it by moulds into a cubical figure, they carry it off to a certain island lying near the British shore, which they call Ictis; for at the reefs of the sea between the island and the main land, the passage being dry, the tanners embrace the opportunity, and carry the tin over in carts to the Ictis or Port; for it must be observed, that the islands which lie between the continent and Britain have this peculiarity, that when the tide is full they are real islands, but when the sea retires they are so many peninsulæ. From this island the merchants bring the tin of the natives, and export it into Gaul; and finally through Gaul, by a journey of about thirty days, to the mouth of the Rhone:" lib. 4. Pofidonius, as quoted by Strabo, says the port to which tin was brought in the south of France was Martius.

To what uses the nations of antiquity applied all the tin which they obtained with so much labour from Britain, is not precisely known. The Phœnicians were celebrated for their skill in the art of dyeing; and the Tyrian purple, which was either a bright crimson or a scarlet, was held in the highest estimation; hence it has been conjectured, with much probability, that the Phœnicians were acquainted with the use of the solution of tin in the preparation of that colour. In the modern art of dyeing scarlet or crimson, the solution of tin in the nitro-muriatic acid is essentially necessary to communicate those colours to woollen cloths or stuffs, a practice which is probably derived from the ancient manufactures of the East.

The mirrors of the civilized nations of antiquity were made of a composition of copper and tin. The most ancient account that we have of these mirrors is that in Exodus, chap. xxxviii. 8. "And he made the laver of brass (a mixture of copper and tin), and the foot of brass of the mirrors of the women." The Jewish women probably received these mirrors from the Egyptians when they left the country; for it was the custom of the Egyptians to carry a mirror in their left hand, when they went to their temples. Cyril de Ado.

Pliny says that the best specula were anciently made at Brundisium of copper and tin. The metallic mixture of tin and copper, for rendering the latter metal white, is mentioned by Aristotle. (De Mirab.) This composition is still in use for the specula of reflecting telescopes. (See SPECULUM.) The ancients also made use of an alloy of tin with copper and lead for pot-metal. In the time of Pliny, pot-metal, *ollaria temperata*, was made of two pounds of lead, and an equal quantity of tin, mixed with one hundred pounds of copper. From the same writer we learn, that the bronze of which the Romans made their statues, and the plates on which they engraved their inscriptions, was composed of one hundred pounds of copper, mixed with twelve pounds and a half of an alloy made of equal parts of lead and tin. He informs us also that tin, *plumbum album*, was employed in coating or tinning copper vessels, to render them more wholesome; and it appears that the Romans not only used pure tin, but the same mixture of tin and lead which some of our workmen use at this time in tinning of vessels. A mixture of equal parts of tin and lead they called *argentarium*; a mixture of two parts of lead and one of tin they called *tertiarium*; and with two parts of tin and

one of lead, they tinned whatever vessels they thought fit. (Watson's Chemical Essays, vol. iv.) In the manufacture of arms, the ancients used an alloy of tin with copper, their brass being a composition of these metals; but by what method they were enabled to communicate to it the necessary degree of hardness is unknown.

What was the relative value of tin, compared with that of gold and silver, as estimated by the Phœnicians, the Greeks, or the Romans, is uncertain.

The process of extracting tin from its ores was probably very imperfect, and remained so in this country to the time of Elizabeth, when Carew informs us that sir Francis Godolphin introduced great improvements in the tin-works.

The reverberatory-furnace appears, from Dr. Borlase, to have been introduced into Cornwall about the beginning of the last century; and about the same time the introduction of pit-coal became general, the wood of the country having been nearly exhausted. Sir Bevil Granville had previously made many experiments for melting tin with pit-coal, but without success, when the ore was smelted at the blowing-houses by large bellows worked by a water-wheel.

Whether the Phœnicians or the Greeks interested themselves in the management of the tin-mines, or whether they were simply merchants purchasing and exporting the tin, is uncertain. It appears, however, by the passage quoted from Diodorus Siculus, that the veins of tin-ore were worked as mines; though it has been, and is still generally believed, that stream-tin was the only ore worked by the ancients. From the testimony of Strabo, Pliny, and others, the Romans not only traded to Britain for tin, but improved the art of mining in Cornwall. The Romans being the conquerors, and the British under them having probably little or no property, they were the working miners, but under what regulations is uncertain. The Saxons did not obtain possession of Cornwall till the reign of Athelstan, and neither they nor the Danes appear to have directed their attention to the mines. After the Norman conquest, the working of mines is said to have yielded great profit. In the time of king John, however, the right of working tin being as yet, says Borlase, wholly in the king, as earl of Cornwall, the property of the miners was precarious and unsettled, and all the tin that was raised was engrossed and managed by the Jews. The *tin-farm* of Cornwall at this time amounted to no more than one hundred marks, according to which valuation, the bishop of Exeter received then, and still receives from the duke of Cornwall, the annual sum of 6*l.* 13*s.* 4*d.*, so low were the tin profits then in Cornwall; whereas in Devonshire, the tin was then farmed at 100*l.* yearly. King John, sensible of the languishing state of the mines, granted the county of Cornwall some privileges, and is said to have also granted a charter to the tanners.

In the time of Henry III. the tin-mines of Spain, which had been worked by the Moors, were stopped, and Cornwall had all the trade of Europe for tin. In the eighteenth year of Edward I., the Jews being banished the kingdom, the mines were again neglected for want of proper encouragement to labour, and security to enjoy and dispose of the products. In consequence of a petition from some Cornish gentlemen to Edmund, earl of Cornwall, a charter was obtained with more explicit grants of privileges of keeping courts of judicature, and managing and deciding stannary causes. About this time, says Borlase, it appears that the rights of bounding or dividing tin grounds into separate portions, for encouraging the search for tin, were more regularly adjusted, and various laws introduced for the protection of the miner.

In the thirty-third year of Edward I. the above charter seems to have been confirmed, and the tanners of Cornwall were made a distinct body from those of Devonshire, before which time the tanners of both counties were accustomed to meet on Hingston-Hill every seventh or eighth year, to concert the common interest of both parties. Two coinages of tin yearly were also granted by this charter, and the tanners had the liberty of selling their own tin, unless the king insisted on buying it himself. Other laws and regulations for the encouragement and protection of the miners, were passed in the reigns of Edward III., Henry VII., and Elizabeth. The mines having been much neglected during the reign of Mary, Elizabeth invited German miners into the country, and great encouragement was given to mining operations in Cornwall, and various parts of England. The quantity of tin procured annually in the succeeding reigns of James I. and Charles, amounted to sixteen hundred tons. During, and for some time after the civil wars, the tin-trade declined, but revived again in the reign of George I., and has since been increasing. For an account of the annual products of the tin-mines of Cornwall and Devonshire, see the article *MINE*.

All the transactions connected with the tin-mines are under the controul of the stannary laws: courts are held every six months, and they decide by juries of six persons, with a progressive appeal to the lord warden and lords of the duke of Cornwall's council. By whatever method or accident a vein is discovered, permission of the proprietor must be obtained before any operations can be commenced, except in the case of such tin-mines as are anciently embounded according to the provision of the stannary laws. (See *STANNARY COURTS*.) The owner of the soil is technically called the *lord*, whose share (which is called his *disb*) is generally one-sixth or one-eighth of the ore. The duke of Cornwall receives a duty of four shillings *per* hundred weight of tin, which is taken when the tin is assayed and licensed: this process is called the *coinage*, from the French word *coin*, a corner. A corner is chipped off each block at the office, and if it be found sufficiently pure, the blocks are stamped with the arms of the duke. The annual revenue of the tin is about 10,000*l.*; the average annual amount being about 3200 tons, and the value about 120*l.* *per* ton. The mode of assay is obviously rude and imperfect; and we have heard that foreigners have recently complained that the British tin was not so pure as that obtained from the East. But whatever be the purity of British tin, there can be no doubt that it is greatly adulterated on the continent. It is said that every tin-founder in Holland has English stamps, and be the quality of the tin what it may, the inscription makes it pass for English. The metal with which British tin is adulterated on the continent is lead, which being five times cheaper, and when mixed in small quantities not easily detected, the temptation for such fraud is great. It is not true, as asserted by some foreign writers of respectability, that British tin is purposely alloyed with certain portions of copper and lead before it is exported from Cornwall. The ores of tin, in the tin-mines of Cornwall, are so intimately associated with portions of copper-ore, lead-ore, arsenical pyrites, and other metals, of which a small mixture will remain in the block-tin, and can only be separated by subsequent refining, that any considerable portion of alloy may be detected by the increase of specific gravity. Grain-tin, which is the purest tin of commerce, is smelted from the finest ore by a charcoal fire: the common block-tin is smelted with pit-coal or culm, as

before stated. Grain-tin is used for various purposes in the arts, where tin of the purest quality is required.

Long as the tin-mines of Cornwall have been worked, they still continue to supply in abundance this useful metal; but from the greater extent of the present works, and from the circumstance of tin always occupying the upper part of the vein, we may infer that the tin-mines of that county will be exhausted at no very distant period. At present, the principal part of the tin is obtained from the western extremity of the county; but when the tin-mines in that district are worked out, we may consider the tin-trade of Cornwall as nearly extinct. The granitic range of Dartmoor, in Devonshire, has been less explored than Cornwall; but there is reason to believe that the metallic repositories of tin and copper which it contains will furnish an ample field for the industry of future adventurers, and a failure in the supply from Cornwall would greatly enhance the price of this metal, and give increased spirit to mining speculations.

TIN, in *Chemistry* and the *Arts*. The colour of tin is white, like that of silver: it has a sensible taste, and when rubbed, emits a peculiar smell: its hardness is greater than that of lead, and less than that of zinc: its specific gravity is stated by Briffon to be 7.291, and it is said to become a little greater by hammering: it is very malleable, and may be beaten into very thin leaves. *Tin-foil*, as it is termed, is usually about $\frac{1}{1000}$ th of an inch in thickness; but this is by no means the utmost degree of thinness which it will bear. Its ductility and tenacity are rather low: a tin wire, $\frac{1}{12}$ th of an inch in diameter, is stated by Muschenbroeck (as quoted by Dr. Thomson) to be capable of supporting a weight of 31 lbs. only, without breaking. Tin may be easily bent, and when bent, produces a peculiar crackling noise: it fuses at about 442° of Fahrenheit's scale, but will bear a most intense heat before it is volatilized. On being exposed to the atmosphere, its surface becomes slightly tarnished, but it undergoes no other change. When kept under cold water it undergoes no change; but red-hot tin, exposed to the vapour of water, decomposes it, an oxyd of tin is formed, and hydrogen gas is evolved. Exposed to the action of the air in a melted state, it quickly becomes covered with a greyish powder, or oxyd; and if the heat is very violent, it is stated to take fire, and to burn with a pale white light.

Tin unites with oxygen in two proportions, as has been lately proved by Gay Lussac, in opposition to Berzelius, who concluded from his experiments that there were three oxyds of tin. (See *Annal. de Chimie et Phys.* vol. i. p. 40.) The first oxyd, or protoxyd, of tin, consists of about

Tin	-	-	100.
Oxygen	-	-	13.6

The second, or peroxyd, of about

Tin	-	-	100.
Oxygen	-	-	27.2

This gives the weight of the atom 7.352. Dr. Thomson is inclined to consider it as 7.375; but it perhaps will be found hereafter either 7.25 or 7.5. The first of these oxyds may be formed by dissolving tin in muriatic acid, either by means of heat, or by adding occasionally a little nitric acid: when dissolved, add to it a solution of potash; a white precipitate falls, which is partly taken up again; but the remainder, on standing, assumes a dark grey colour, and even a metallic lustre; and on being heated to whiteness, is pure protoxyd of tin. The peroxyd may be formed by boiling

boiling the protoxyd in dilute nitric acid, drying by evaporation, and heating to redness.

Tin forms likewise two combinations with chlorine. When tin is burnt in chlorine, a very volatile clear liquor is formed, a non-conductor of electricity, and which, when mixed with a little water, becomes a solid crystalline substance, a true muriate of tin, containing the peroxyd of tin. This compound has been called the *smoking liquor of Libavius*, from its discoverer, who formed it by distilling together amalgam of tin and corrosive sublimate. According to the experiments of Dr. John Davy, it consists of two atoms or proportions of chlorine united to one of tin; or of about

Tin	-	-	100.
Chlorine	-	-	121.82

Prochloride of tin, first described by Dr. J. Davy, is a grey, semi-transparent, crystalline solid, and may be formed by heating together amalgam of tin and calomel. According to the same chemist, it consists of one atom or proportion of chlorine united to one of tin; or of about

Tin	-	-	100.
Chlorine	-	-	60.72

Tin combines readily with sulphur and phosphorus, but not with hydrogen, azote, carbon, or boron.

There are two sulphurets of tin; the first may be formed by fusing tin and sulphur together: it is of a blueish colour, and lamellated structure; and from the experiments of Dr. J. Davy, consists of one proportion of tin united to one of sulphur. The other sulphuret of tin is made by heating together the peroxyd of tin and sulphur. It is of a beautiful gold colour, and appears in fine flakes. It was formerly called *aurum musivum*, and various complicated processes given for forming it. Pelletier and Proust investigated its nature, and concluded it to be a compound of oxyd of tin and sulphur; but Dr. Davy has shewn that this is not the case, and that it consists merely of one proportion of metallic tin united to one proportion of sulphur.

The phosphuret of tin may be formed by heating the two substances together. Only one phosphuret is known: it has a metallic appearance, and is so soft that it may be cut with a knife. When gently heated in the air, the phosphorus takes fire. According to the experiments of sir H. Davy, it contains about 17 per cent. of phosphorus, and consists therefore of one atom or proportion of phosphorus united to one of tin.

Tin combines with most of the metals, and some of its alloys are much employed.

Its alloys with the metals of the fixed alkalies speedily tarnish in the air, and effervesce in water.

It readily unites with gold by fusion, and was formerly supposed to have the property of rendering this metal brittle; but this has been more recently denied. An alloy of 11 gold and 1 of tin, was found by Mr. Hatchett to have a pale whitish colour, brittle when thick, but when cut thin, capable of being bent easily. Its fracture was fine-grained, and of an earthy appearance. Mr. Alchorn found, that gold alloyed with no more than $\frac{1}{3}$ th of tin, retains its ductility sufficiently to be rolled and stamped in the usual manner. But Mr. Tillet shewed, that when heated to redness, the tin melts, and the alloy falls to pieces.

Its alloys with platina, according to Dr. Lewis, are brittle and dark-coloured, when the two metals are in equal proportions. The alloys of tin and silver are very hard and brittle. The alloys, or rather amalgams, of tin and mer-

cury differ in hardness, according to the proportions in which the two metals are mixed: three parts of mercury and one of tin form an amalgam which crystallizes in cubes, or, according to Sage, in the form of brilliant square plates, thin towards the edges. Tin readily combines with copper, and forms alloys exceedingly useful for a variety of purposes, as will be briefly noticed when we speak of the uses of this metal. Tin does not readily combine with iron, but their union may be effected by fusing them together in close vessels: it combines with zinc by fusion, and the alloy is harder than zinc, and stronger than tin: with lead it readily unites in all proportions, and the lead by the addition becomes considerably harder.

The oxyds of tin are capable of combining with the alkalies, and of forming with them peculiar compounds.

Salts of Tin.—Tin is oxydated and dissolved by many of the acids, and forms salts, differing in their nature according to the degree of oxydization of the metal.

Nitrates of Tin.—Concentrated nitric acid (specific gravity 1.48) poured on tin, exerts but little action upon it; but if a little water be added, a violent action is exerted, and peroxyd of tin is formed, which separates in the form of a white powder, this oxyd being apparently incapable of combining with nitric acid: in this case, both the acid and the water are decomposed, and nitrate of ammonia is formed; but if the acid be diluted, and care be taken to moderate its action upon the metal, the water only is chiefly decomposed, and the protoxyd of tin is formed, which combining with the nitric acid, forms a solution of a yellow colour, which is a real nitrate of tin. Still, however, a little nitrate of ammonia is formed, and the nitrate of tin itself is not permanent, the metal continuing to pass to the state of peroxyd, and gradually separating. The same change is produced by heating the solution, a precipitate being deposited, which, however, is partly subnitrate of tin.

Muriates of Tin.—We have already spoken of the chlorides, or compounds of tin with chlorine. Now if water be added to these chlorides, they are converted into muriates of tin. The muriate of tin, in which the metal is in the state of protoxyd, may be formed, however, by dissolving tin in about four times its weight of muriatic acid: hydrogen escapes, and the solution has a brownish-yellow colour, and yields, on evaporation, small needle-shaped crystals, soluble in water, and somewhat deliquescent. Water poured upon it in small quantity decomposes it, and converts it into a submuriate, which is precipitated, and a super-muriate, which remains in solution. A similar effect is produced by the alkalies, when not added in excess. This muriate of tin, formed of the protoxyd, has a great tendency to combine with oxygen, and to pass into the state of muriates with the peroxyd, and this property enables it to exert many curious efforts upon other metallic salts. Thus, for example, the red oxyd of mercury, the black oxyd of manganese, the white oxyd of antimony, the oxyds of zinc and silver, are deprived of their oxygen by this salt, and reduced to the metallic state. The muriate of tin with the peroxyd of the metal may be formed as before mentioned. It is capable of crystallizing, and possesses properties quite different from those of the muriate above described. It is much used by dyers, who generally form it by dissolving tin in nitro-muriatic acid.

Sulphate of Tin.—Sulphuric acid, when cold, has little action on tin, but assisted by a moderate heat, it attracts oxygen from it; sulphurous acid gas is evolved, and a sulphate of tin is formed, which yields, when evaporated, small needle-formed crystals. It is probable there are two sulphates

sulphates of tin, though their properties do not appear hitherto to have been distinctly defined.

The *phosphate*, *fluat*, and *borate of tin* may be formed by double decomposition, by adding solutions of their alkaline salts to a solution of muriate of tin. They are all insoluble compounds, and have been but imperfectly examined. No *carbonate of tin* appears to exist.

The other salts of tin are unimportant, and but little known. The *acetate* has been most investigated: it may be formed by boiling tin in acetic acid. The solution has a whitish colour, and yields crystals by evaporation. There appears, however, to be another *acetate*, (formed probably with the peroxyd of the metal,) that does not crystallize, but is capable of existing only, on evaporation, in the form of a gummy mass.

Uses of Tin and its Compounds.—Tin and its compounds are extensively used in the arts. We shall here briefly point out some of the more important operations in which they are concerned, referring our readers for further particulars to the different articles themselves. An amalgam of tin and mercury forms the metallic coat of glass mirrors. For the method of performing this operation, see the article *SILVERING of Mirrors*.

The compounds of tin with copper are very important. Of this alloy *cannons* are made, also *bell-metal*, *bronze*, and the *mirrors* or *specula of telescopes*. For these different purposes, the two metals are mixed in different proportions, which are pointed out more particularly under their respective articles.

Vessels of copper, especially for culinary purposes, are usually covered with a thin coating of tin, to prevent the copper from oxydating. (See the article *TINNING*.) Thin iron plates covered with this metal, form what is known by the name of *tin-plate*; which see.

The oxyd of tin, mixed with that of lead, forms *putty*, which is much used in polishing metals. See *PUTTY* and *SPECULUM*.

Tin alloyed with lead forms *folder*; which see.

Of the salts of tin, a solution of the *muriate*, or *dyers' liquor*, as it is termed, is used as a mordant in dyeing scarlet. See the articles *DYEING*, *MORDANT*, and *RED*.

The solution of tin in aqua regia, added to the tinctures of cochineal, of gum-lac, and of some other red tinctures, heightens the colour of these, and changes it from a crimson or purple to a vivid reddish-yellow, or fire-coloured scarlet. The new scarlet, or Bow dye, is obtained in this manner; and it is said, that our most beautiful and lasting-coloured fine cloths owe their superlative excellence to the retentiveness given by our fine grain-tin; inasmuch, that the English superfine broad-cloths, dyed in grain by the help of this ingredient, are become famous in all markets of the known world.

Mr. Pryce apprehends, that the purple dye of the Tyrians owed its reputation wholly, or in part, to the use of our tin in the composition of their dye-stuff, as the tin-trade was solely under their own direction.

This colour, however, succeeds only with wool and other animal matters. Attempts have been made, but without success, to give this colour to thread, to cotton, and even to silk, though this latter substance has many properties of animal matters. The solution of tin made with marine acid alone, or with vitriolic acid, does only give to red tinctures a crimson colour, as alum does. Vegetable acids, as vinegar and cream of tartar, are also capable of dissolving tin.

Tin or its compounds are not used in medicine. They do not appear to be of a poisonous nature; but the muriate of tin, taken into the stomach in considerable quantity, speedily induces death, apparently merely from its corrosive qualities.

It was formerly recommended for its anthelmintic virtues; but it is possible, says Dr. Lewis, that these may proceed not so much from the pure metal, as from a certain substance of a different or arsenical nature, of which the purest sorts of tin are found to participate.

The principal preparations of tin are as follow:

TIN, Butter of, is a name given by some chemists to a combination of tin with the concentrated marine acid of corrosive sublimate. It is procured by reducing these substances into small parts, and mixing them together: this mixture will, by degrees, be moistened by attracting the humidity of the air. The decomposition of the corrosive sublimate by the tin is more speedily effected by distillation.

TIN, Calx of, is the metal reduced into a powder, either by means of fire, or by being dissolved in an acid menstruum, and precipitated with an alkali.

TIN, Cerufs of. See *Spanish WHITE*.

TIN, Diaphoretic of. See *ANTIHECTICUM Poterii*.

TIN, Flowers of, are a kind of white cosmetic, or paint for the complexion, drawn from tin with sal ammoniac, by means of sublimation.

TIN, Gold-coloured preparation of, is made by adding six ounces of mercury to twelve of melted tin, pulverizing the cold mass, mixing with it seven ounces of flowers of sulphur and six of sal ammoniac, and subliming in a matrass.

This preparation is called *aurum mosaicum*, and as a medicine is little regarded, though formerly much esteemed against hysterical and hypochondriacal complaints, malignant fevers, and venereal disorders. Upon experiment, it appears to be little more than calx of tin.

TIN, Salt of, Sal Jovis, is prepared from twelve ounces of calx of tin, and four of aqua regia, diluted with twenty-four of water: after digestion for two days, the vessel is to be shaken, the more ponderous part of the calx suffered to settle, the turbid liquor poured off, and evaporated almost to dryness, and the mass farther exsiccated on brown paper: to the remaining calx half the quantity of fresh menstruum is to be added, and the process repeated. Dr. Lewis's experience has not enabled him to pronounce on the virtues of this salt, which is in taste very sharp and corrosive: he thinks it needless to calcine the metal, as tin uncalcined dissolves much more easily and plentifully, and the solution is in both cases the same. According to Hoffmann, the solution of tin is a strong purgative. Lewis's Mat. Med.

TIN is also a word used by some of the chemical writers to express sulphur.

TIN-Coping, in *Rural Economy*, a sort of covering of this kind of metallic substance in the sheet form, which is not unfrequently employed on the upper parts of the frames, stands, or staddles of corn-stacks, for the purpose of preventing destructive vermin from entering or getting into them. It is a cheap, ready, convenient, and useful material in this intention, in many cases, which the arable farmer should not be inattentive to in his stack-yard.

TIN-Floors, a contrivance used by our husbandmen who propagate hops, to dry them after the gathering. See *OOST*.

It is thus done: Let a square brick room be built, with a door on one side, and a long fire-place of a foot wide in the middle, reaching almost across it; let holes be made at the sides of this fire-place, to let out the heat into the room; and at the height of five feet above this, let a floor be made of laths of an inch thick, laid lattice-wise. Let this be covered with great plates of double tin, taking care that the joinings of the tin be well foldered, and lie upon the laths, nor over the interstices, which may be about four inches wide. Let a row of boards be fitted round the edge of

this floor, to keep the hops from falling off; then lay on a covering of hops of a foot thick, and make a small fire of charcoal in the mouth of the fire-place, and the hops will dry very quickly and very regularly. They may be continually stirred about while drying, and, when dry, a part of the boarded edge of the kiln may be taken down, and the dried parcel thrust out, and a fresh parcel laid on in their place. A very small quantity of fuel is sufficient in this way, and any fuel will do, for the smoke never comes at the hops. There is a very great improvement still upon this method of drying hops, used by some people: this is the making of a wooden cover, of the size of the tin-floor; this is covered with plates of tin nailed on, and is suspended over the kiln in such a manner, that it may be let down at pleasure, when the lower parts of the hops are dry. This is to be let down within ten inches of their surface, and there it acts as a reverberatory, and drives back the heat on the upper ones, so that they are dried as soon as the lower ones. Thus all the trouble of turning is saved, and the hops are much better dried than in any other way. Mortimer's Husbandry, p. 186. See VENTILATOR.

TIN-Foil. See FOIL, FOLIATING, and LOOKING-GLASS.

TIN-Hatch, in Mining, a term used by the people of Cornwall, to express the opening into a tin-mine. They also call it *tin-shaft*.

They make several openings in the sides of the hills where they expect veins of ore to be. All these, except that which opens on the head of the mine, are called *essay-hatches*; but that which does so, is made their entrance afterwards, and changes its name to that of the tin-hatch. See HATCHES and SHAFT.

TIN-Hoop for Cheese, in Rural Economy, a light thin hoop constructed of this sort of sheet metallic substance, that is sometimes employed in cheese-making, for holding and keeping the curd together while it is breaking and being crumbled down into the filling-vat, in order to prevent the trouble of raising and holding up the corners of the cloth which is made use of in the business. It is usually about nine inches in breadth, and formed so as exactly to fit the top part of the cheese-vat on which it rests when used. These hoops are sometimes made of other materials, as wood, &c. and are useful in saving time and trouble.

TIN-Ore, called *tin-stuff* by the miners in Cornwall. See TIN-Stone.

M. Gellert directs, that ores of tin should be assayed in the following manner: Mix a quintal of tin-ore, washed, pulverized, and twice roasted, with half a quintal of calcined borax, and half a quintal of pulverized pitch; these are to be put into a crucible, moistened with charcoal-dust and water, and the crucible placed in an air-furnace: after the pitch is burnt, give a violent fire during a quarter of an hour, and then withdraw the crucible. If the ore be not very well washed from the earthy matter, as it ought to be, a larger quantity of borax is requisite, with some powdered glass, by which the too quick fusion of the borax is retarded, and the precipitation of the earthy matter is prevented. If the ore contains iron, to the above mixture may be added some alkaline salt. See MOOR-Stone.

The method of assaying tin-ore, says Mr. Pryce, is very easy; for in its form and size of black tin (which is the ore dressed by stamping, several washings, and calcination, if mineralized with vitriolic, arsenical, or sulphureous pyrites) great part of the work is done, and little more remains than fusion, which is accomplished by a red heat in the following process: Take four or five ounces of black tin as emptied from the sacks, mix it well with about one-fifth part of its weight of powdered culm; put the mixture in a black-lead

crucible, on the wind furnace, and, in about twenty minutes, the metal will be found precipitated to the bottom of the crucible, the culm and scoria floating on the tin. On the surface of this matter there will be globules of tin; and therefore the mixture should be stirred with an iron rod, to make them fall into the tin at the bottom. Close the furnace, and let the whole remain in fusion from three to five minutes. Keep in readiness an iron or brass mortar, and an ingot-mould about six inches long; pour the tin into the ingot, and empty the culm and scoria into the mortar, scraping off what remains in and about the crucible with a sharp iron. As soon as cold, put them into another mortar, and pulverize them gently, so as to separate the scoria from the largest of the globules of tin. Select the larger globules, and pulverize the remainder a second time; then put this stuff, twice powdered, on a shovel, and passing it often through water, in the same manner as the lighter parts are washed from ores in vanning, and the smaller globules will remain on the shovel; and these, with the larger (both together being generally called *pillion-tin*), being added to, and weighed with the ingot, shew the produce in metal of the four or five ounces assayed. See Macquer's Chem. Dict.; and Pryce's Min. Corn. p. 269.

TIN-Plates, an article of manufacture very common among us, and vulgarly called *tin*. It is iron plated over with tin. The French call it *fer blanc*, white iron, as we sometimes do in England. It was once known under a distinct name, *latten*, under which article the process of manufacturing it is described.

The process used for this purpose near Caermarthen, in South Wales, which is described by Mr. Donovan, in his "Descriptive Excursions through South Wales in 1805," is as follows:

The iron-ore employed in this manufactory is the common kind of the country, intermixed with a large portion of the fine hæmatite from Ulverstone, in Lancashire, which gives a very fine metal. This too is smelted with charcoal instead of coke, to produce a metal of the greatest purity and extensibility, and closeness of texture, which qualities are particularly required in this manufacture. The reduced ore is smelted in the usual manner, and cast into pigs, which are then wrought by the hammer into long flat bars, that are afterwards cut into pieces of about ten inches in length. These are then wrought into plates by being heated red-hot, and passed through a flattening-mill, which consists of two large cylinders of steel, case-hardened and secured in a frame of iron. These are placed contiguous to each other, but with a certain interval of space, and revolve in a contrary direction, so that when one end of the bar is thrust in the space between the cylinders, the whole is drawn through and proportionably extended and flattened in the passage. The distance between the cylinders, which of course determines the thickness of the plate, is maintained and regulated by screws which can be altered at pleasure. When the bar is thus made into a plate of twice the thickness of the ordinary plates, it is heated red-hot, cut in two by a pair of shears, and one piece folded exactly over the other, and both repeated through the cylinders till the folded plate has extended to the same length and breadth as the plate was before cutting. It is then clipped round the edges, and the two plates torn asunder (which requires some little force) after which they are each finished by passing through a finer rolling-press, so as to take away every crease or inequality in the plate, and those that are too rough to pass through this finer press are thrown aside.

The plates are then steeped in a very weak acid liquor, and when taken out are scoured thoroughly with bran, so as

TINCTURE.

to be quite bright and polished to enable the tin to adhere. The tin is melted in deep rectangular crucibles, and kept fluid by a moderate charcoal fire beneath. To prevent its calcination, a quantity of greafe prepared from linfeed-oil and fuet is constantly kept floating on the surface of the tin, and renewed as it evaporates off, which gives an excessively nauſeous ſtench. The plate is then taken up by one corner by a pair of pincers, and dipped vertically into the tin, and when withdrawn is found beautifully white and reſplendent with the coating of this metal that adheres to it. This dipping is repeated three times for what is called *ſingle tin-plate*, and ſix times for the *double plate*. The plates are then only cleaned and ſorted, and are fit for uſe.

We ſhall here add, with regard to the hiſtory of this manufacture, that in the year 1681, tin-plates were made in England by one Andrew Yarranton, who was ſent to Bohemia to learn the manner of making them. But the manufacture was diſcontinued by his employers, and afterwards ſo much diſregarded, as to be reckoned among the projects called bubbles of the year 1720; however, it was revived, and brought to ſuch perfection about the year 1740, that very little of it was imported from foreign parts; our own plates being of a finer gloſs, or coat, than that made beyond ſea, the latter being hammered, and ours being drawn under a rolling-mill. *And. Hiſt. Com. vol. ii. p. 175, 361.*

The two principal wholeſale houſes for this manufacture in London, are thoſe of Jones and Taylor in Tottenham-court Road, and Howard and Co., in Old-ſtreet Road.

TINA, a name given by the old medical writers to a bath made of a ſtrong decoction of many carminative ingredients to be uſed in the colic.

TINA, in *Geography*. See **KNIN**.

TINAGOB, a town on the W. coaſt of the iſland of Samar. N. lat. 12° 5'. E. long. 124° 30'.

TINALMO, a town on the S. coaſt of the iſland of Luçon. N. lat. 13° 38'. E. long. 122° 42'.

TINAMASAKI, a town of Japan, on the S. coaſt of the iſland of Niphon. N. lat. 34° 12'. E. long. 136° 55'.

TINAPA, a town of Mexico, in the province of New Biſcay; 120 miles N.W. of Duranga.

TINARA, a town of Nubia, on the Nile; 200 miles S.S.W. of Syene.

TINCA, the *Tench*, in *Ichthyology*. See **CYPRINUS TINCA**, and **TENCH**.

TINCA Marina, the *ſea-tench*, a name given by ſome authors to the common *turdus*, called in Engliſh the *wraſſe*, and *phycis*.

TINCAL, is a name given to borax in the crude ſtate in which it is brought from India, and before it is refined. It conſiſts of ſmall cryſtals of a yellowiſh colour, and it has a greaſy or unctuous touch. See **BORAX**.

According to M. Cadet, it contains a larger quantity of the peculiar vitreſcible earth of borax than the refined ſalt commonly fold does. See **BAURAC**.

TINCAUSARIS, in *Ancient Geography*, a place of Africa, in Cyrenaica, on the route from Carthage to Alexandria, between Boreum and Atticis. Anton. Itin.

TINCHEBRAY, in *Geography*, a town of France, in the department of the Orne; 10 miles N. of Domfront.

TINCO, a town of Spain, in the province of Aſturias; 20 miles N.W. of Oviedo.

TINCONTIUM, or **TINCONCIUM**, in *Ancient Geography*, a town of Lyonneſe Gaul, between Avarican and Deceida. Anton. Itin.

TINCTOR, JOHN, in *Biography*, born at Nivelles, in Brabant, and flouriſhed about the year 1474. He was a great

muſician, long in the ſervice of Ferdinand of Aragon, king of Naples and Sicily, who reigned from 1458 to 1504, and ſtyles himſelf his arch-deacon, chaplain, and cantor. Beſides ſeveral muſical traćts by this early writer on counterpoint, he was author of the firſt muſical dictionary. All written muſic in counterpoint during the fifteenth century was compoſed for voices, at leaſt we have never ſeen any other; and being intended for the church, was ſet to Latin words: ſo that the firſt terms uſed in the art, were likewiſe in that language; and theſe were ſo numerous in Tinctor's time, that he collected them, under the title of "Terminorum Muſicę Diffinitorium," and printed them at Naples. This was doubtleſs not only the firſt muſical dictionary that was ever compiled, but the firſt book that was printed on the ſubject of muſic in general. The work is ſo ſcarce, that we have never been able to find it, except in his majeſty's inſtitutable library. In this "Diffinitorium," we firſt met with the precise definition of the four principal parts in vocal counterpoint: *cantus, altus, tenor, and baſe*; which ſee under their ſeveral heads.

Tinctor, in one of his traćts, gives to the Engliſh the invention of counterpoint. See **DUNSTABLE**.

Walther ſeems never to have heard of Tinctor's "Diffinitorium;" but he gives the title of his three traćts: "De Arte Contrapuncti;" "De Tonis;" and "De Origine Muſicę;" from Geſner's *Bibl. Univ.*

TINCTORUM RUBIA. See **MADDER**.

TINCTURE, TINCTURA, in *Pharmacy and Chemistry*, a ſeparation of the finer and more volatile parts of a mixed body, made by means of a proper menſtrum diſſolving the ſame.

TINCTURE is more particularly uſed for an extract of part of the ſubſtance of a body, eſpecially its flavour and colour, which are hereby communicated to the menſtrum.

TINCTURES, in the *Materia Medica*, are ſpirituous ſolutions of ſuch of the proximate principles of vegetables and animals, as are ſoluble in pure alcohol or in proof-ſpirit; and they are ſaid to have been invented about the end of the thirteenth century, by a profeſſor of medicine at Montpellier, called Arnold de Villa Nova. From vegetable matter ſubmitted to its action, alcohol takes up ſugar, refin, extractive, tannin, cinchonin, camphor, volatile oils, ſeveral acids, and the narcotic principle; proof-ſpirit alſo takes up the whole of theſe partially, and is beſides the proper menſtrum for gum-refins; ſo that alcohol, either in a concentrated or diluted form, is capable of ſeparating the greater part of the active principles of vegetables from the ligneous inert fibres. The tinctures obtained from animal ſubſtances are very few in number, and the principles taken up by the ſpirit are analogous to thoſe enumerated above, belonging to the vegetable kingdom.

Pure alcohol is required in very few inſtances only for the formation of tinctures, proof-ſpirit being adequate for almoſt every purpoſe. The dilution of the ſpirit, however, muſt be varied according to the known principles of the ſubſtances to be ſubmitted to its action; when refin predominates, it muſt neceſſarily be more concentrated; when gum-refin or extractive is the moſt abundant conſtituent, proof-ſpirit then muſt be employed. In conſequence of the great affinity of water for alcohol, the addition of it to alcoholic tinctures ſeparates the refin, camphor, and volatile oils they contain; but water is generally miſcible with tinctures made with proof-ſpirit, without producing any decomposition. Tinctures are not liable to ſuffer ſpontaneous decomposition, as is the caſe with infuſions and decoctions; and, independently of the loſs which takes place from the evaporation of the ſpirit and the volatile oils, if the bottles containing tinctures be cloſely corked, they may

TINCTURE.

be kept for an indefinite length of time, and their virtues remain unimpaired.

Tinctures are prepared by macerating the ingredients in the spirit in a temperature not exceeding 80°, at which degree, by allowing the menstruum to remain on the ingredients for a sufficient length of time, all the principles that can prove useful in the tincture are extracted, and the solvent saturated. The ingredients must be dried and reduced to a coarse powder, and the maceration made in close vessels, and assisted by frequent agitation. When completely made, tinctures should not be allowed to remain upon the ingredients, but be filtered through bibulous paper, and kept in this state in well-corked bottles.

The chief use of this class of preparations is to cause infusions and decoctions to which they are added, to sit lighter upon the stomach, or to unite with them some active principle, which the water is incapable of extracting. Thomson's London Dispensatory.

A great variety of tinctures may be given to common water, and many remarkable things occur in their changes on the addition of common menstrooms. Take a large spoonful of the syrup of pomegranate-flowers, mix it with five spoonfuls of water; the mixture will be of a very lively and brilliant red: for a violet colour, take the same quantity of syrup of violets and the same of water. When these tinctures are thus prepared, have at hand a phial, in which is a small portion of oil of tartar, which will only look like water remaining after the washing of the phial. Pour the red or the violet tincture into this phial, and it immediately becomes a fine grass-green. Dissolve the quantity of a walnut of crude sal ammoniac in a glass of water, pour all out except three or four drops at the bottom, and pour into this glass the fine red liquor, and it immediately becomes black as ink. In order to change the purple liquor red, only have a small quantity of spirit of vitriol in the bottom of a phial, and pour into this the violet water; it immediately on this becomes of a florid red.

Steep Brazil wood in common water, or in white wine, twenty hours; the liquor will then look of the colour of red wine: pour this into a glass washed with vinegar, and it becomes of a fine yellow, like sack. If this experiment be made with white wine, the wood and the vinegar make so little alteration in it, that it may be drank afterwards, and the whole process seems a way of turning red port into sack. Into this liquor, when yellow, put a few drops of a tincture of benjamin made in spirit of wine, and it immediately loses its yellow colour and becomes white. Beat some galls to fine powder, and rub the powder on a towel; then put into a basin of water, in which any person is going to wash their hands and face, a small piece of common green vitriol, or copperas: after the person has washed, let them have this towel to wipe on, and the hands and face will be as black as if washed with the common writing-ink; the copperas in the water and the galls on the towel making real ink where they mix. This does no lasting injury to the skin, but will come off again upon washing with soap. Phil. Trans. N° 238, p. 88.

We shall here enumerate and describe the principal tinctures that occur in the materia medica.

TINCTURE of Acetate of Iron is prepared, according to the Dub. Phar. by adding together two ounces of acetate of kali and one ounce of sulphate of iron in a stone-ware mortar, till they unite in a soft mass, and when dried by a moderate heat, triturating it with two pints of rectified spirit of wine; and then digesting it for seven days in a phial, closely corked, and frequently agitated, and then pouring the clear tincture from the fæces.

TINCTURE of Acetate of Iron with Alcohol, is prepared by

rubbing together sulphate of iron and acetate of alkali, of each an ounce, and proceeding as in the former article, triturating with two pints of alcohol; and digesting for twenty-four hours. These tinctures have a peculiar odour, a reddish-brown colour, and a warm styptic taste; and possess the same medical properties as the other preparations of iron. The dose of either may be from ℞ x to ℥j, given in water or any other suitable vehicle.

TINCTURE of Acetate of Zinc of the Dub. Ph., is obtained by rubbing sulphate of zinc and acetate of kali, of each an ounce, and adding one pint of rectified spirit of wine, and then macerating for a week with occasional agitation, and filtering through paper. This tincture is astringent, but requires to be diluted with water, before it is used either as a collyrium or an injection. It may be beneficially employed as an internal remedy in dyspepsia and other debilities of the stomach.

TINCTURE of Aloes of the Lond. Ph., is prepared by macerating of extract of spiked aloes powdered, half an ounce; of extract of liquorice, an ounce and a half; of water, a pint; and of rectified spirit, four fluid-ounces, in a sand-bath until the extracts are dissolved, and then straining.

The *tincture of aloes* of the Dub. Ph. is obtained by digesting for seven days, half an ounce of focotorine aloes powdered, an ounce and a half of extract of liquorice dissolved in eight ounces of boiling water, and eight fluid-ounces of proof-spirit, and then straining.

The *tincture of focotorine aloes* of the Edinb. Ph. is formed by digesting for seven days, with a gentle heat, in a close vessel, often shaken, half an ounce of focotorine aloes in powder, an ounce and a half of extract of liquorice, four ounces of alcohol, and a pound of water; and pouring off the clear tincture. Its dose is from ℥ʒss to ℥ʒjss.

Tincture, ethereal, of aloes of the Edinb. Ph., is prepared by digesting an ounce and a half of myrrh with a pound of sulphuric ether with alcohol, for four days, in a closed bottle, and then adding one ounce of English saffron cut, and one and a half of focotorine aloes in powder; digesting again for four days, and pouring off the tincture. This is a warm stomachic purgative, and is given with advantage in dyspeptic affections, jaundice, gout, chlorosis, and other cases in which aloetics are proper; in doses of ℥ʒj or ℥ʒij as a stomachic, and in larger doses as a brisk purge.

Tincture, compound, of aloes of the Lond. and Dub. Ph., is prepared by macerating for fourteen days (seven days Dub.), of extract of spiked aloes powdered, and saffron, of each three ounces, in two pints of tincture of myrrh; and straining.

Tincture of aloes and myrrh of the Edinb. Ph., is prepared by mixing a pound and a half of alcohol with half a pound of water, and then adding two ounces of myrrh in powder; digesting for four days; and, lastly, adding of focotorine aloes in powder an ounce and a half, and an ounce of English saffron cut; digesting again for three days, and pouring off the clear tincture. This tincture may be administered in the same cases and doses as the former; and it is occasionally used as a local stimulant to foul ulcers.

The *tincture of aloes*, formerly called *tinctura sacra*, and *hiera picra*, was ordered to be made by digesting five ounces of the powder, called *hiera picra*, or a powder formed of eight parts of aloes and two of canella alba, in five pints of mountain wine; or an ounce of aloes, with one drachm of the lesser cardamom seeds, and the same quantity of ginger, in two pounds of the same wine. Lewis.

Dr. Buchan directs this tincture to be made by infusing an ounce of focotorine aloes in powder, and two drachms of Virginia snake-root, and as much ginger, in a pint of mountain

TINCTURE.

mountain wine and half a pint of brandy, for a week, frequently shaking the bottle, and straining off the tincture. This, he says, is a safe and useful purge for persons of a languid and phlegmatic habit; but it is thought to have better effect when taken in small doses as a laxative. The dose, as a purge, is from one to two ounces.

TINCTURE of Ambergris. See AMBERGRIS.

TINCTURE of Ammoniated Iron. See IRON.

TINCTURE of Angustura Bark. See ANGUSTURA.

TINCTURE of Antimony used to be thus made: Take salt of tartar, a pound; antimony, half a pound; rectified spirit of wine, a quart; reduce the antimony to powder, and mix it with the salt by fusion over a strong fire. When it is cold powder it, and pour on the spirit of wine; digest them together in a sand-heat, and then filter off the clear tincture for use. The salt of tartar yields a tincture as well as antimony. It is a diaphoretic and attenuant. See ANTIMONY.

This tincture, on an empty stomach, is said to have sometimes proved emetic.

TINCTURA Antiphthifica. See TINCTURA Saturnina.

TINCTURE, Aromatic, may be prepared by infusing two ounces of Jamaica pepper in two pints of brandy, without heat, for a few days, and then straining off the tincture. This will answer all the intentions of the more costly preparations of this kind.

TINCTURE of Assafœtida. See ASSAFœTIDA.

TINCTURA Aurantii, Tincture of Orange-peel, is obtained in the Lond. and Dub. Ph., by macerating three ounces of fresh orange-peel in two pints of proof-spirit for fourteen days (three days Dub.), and filtering. This is an useful adjunct to infusions and decoctions in dyspepsia, communicating to them an agreeable flavour, and not decomposable by water.

TINCTURE of Bark. See ANGUSTURA and *TINCTURE of Cinchona.*

TINCTURE of Benzoin, Compound, of the Lond. and Dub. Ph., is prepared by macerating for fourteen days (seven days Dub.), three ounces of benzoin, two ounces of storax balsam strained, one ounce of balsam of Tolu, and half an ounce of spiked aloes, in two pints of rectified spirit, and filtering.

The *compound tincture of benzoin* of the Edinb. Ph., or *Traumatic balsam,* is obtained by digesting for seven days, three ounces of benzoin in powder, two ounces of balsam of Peru, half an ounce of hepatic aloes in powder, in two pints of alcohol, and filtering through paper. This tincture is a stimulating expectorant, and sometimes prescribed in chronic catarrh and old asthmatic cases; but chiefly used as an external application to wounds and languid ulcers. Its dose is from fʒʒs to fʒij, or more. See BENZOIN.

TINCTURE of Calumba of the Lond. Ph., is had by macerating for fourteen days of calumba (or Columbo) root sliced, two ounces and a half, in two pints of proof-spirit, and filtering.

The Edinb. *tincture of calumba* is obtained by digesting for seven days, two ounces of calumba root in powder, in two pounds of proof-spirit, and filtering through paper. This is an useful addition to stomachic infusions and decoctions. See COLUMBO.

TINCTURE of Camphor, Compound, is ordered by the Lond. Ph. to be prepared by macerating for fourteen days, of camphor two scruples, of hard opium powdered and acid of benzoin, of each one drachm, in two pints of proof-spirit, and filtering.

The *camphorated tincture of opium,* or "paregoric elixir," is obtained by digesting for ten days, of hard purified opium in powder, and benzoic acid, of each a drachm, of camphor

two scruples, of essential oil of aniseed ʒ drachm, in two pints of proof-spirit, and filtering. This is an useful anodyne in chronic asthma, whooping-cough, and catarrh after the inflammatory symptoms have abated, and contributes to allay the frequent cough. The dose is from fʒj to fʒij occasionally, using after it the inhaler, and fʒij in cases where quiet, rather than sleep, is required. See CAMPHOR.

TINCTURE of Capsicum of the Lond. Ph., is obtained by macerating for fourteen days, an ounce of capsicum berries in two pints of proof-spirit, and filtering. The dose in tympanitis, cynanche maligna, the low stage of typhus, and such cases, is from fʒʒs to fʒj; and a mixture of fʒvj with half a pint of water will answer all the purposes of the capsicum gargle. See CAPSICUM.

TINCTURE of Cardamoms of the Lond. and Dub. Ph., is prepared by macerating for fourteen days (seven days Dub.) three ounces of cardamom seeds husked and bruised, in two pints of proof-spirit, and filtering.

The *tincture of cardamoms,* or "tinctura amomi repentis," of the Edinb. Ph. is had by digesting for seven days, four ounces of lesser cardamom seeds bruised, in two pounds and a half of proof-spirit, and filtering through paper.

The *compound tincture of cardamoms* of the Lond. and Dub. Ph. is prepared by macerating for fourteen days, cardamom seeds (husked Dub.), caraway seeds and cochineal, of each, in powder, two drachms, cinnamon bark bruised half an ounce, stoned raisins four ounces, in two pints of proof-spirit, and filtering. These are agreeable additions to stomachic infusions.

TINCTURE of Cascavilla. See CASCARILLA.

TINCTURE of Cassia. See CASSIA.

TINCTURE of Castor of the Lond. and Dub. Ph., is formed by macerating for seven days, of castor powdered two ounces, in two pints of rectified spirit (proof-spirit Dub.) and filtering. The Edinb. Ph. directs an ounce and a half of Russian castor powdered to be macerated for seven days in one pound of alcohol, and then filtered. The dose is from ℥xx to fʒij. See CASTOR.

The *compound tincture of castor* of the Edinb. Ph. is obtained by digesting for seven days, one ounce of Russian castor powdered, half an ounce of assafœtida, in a pound of ammoniated alcohol, and filtering through paper. This is advantageously given in hysteria, cramp of the stomach, and flatulent colic, to the extent of fʒij for a dose.

TINCTURE of Catechu of the Lond. and Dub. Ph., is prepared by macerating for fourteen (seven Dub.) days, three ounces of extract of catechu, and two ounces of cinnamon bark bruised, in two pints of proof-spirit, and filtering.

The *tincture of catechu,* formerly *Japonic tincture* of Edinb. Ph., is prepared by digesting for seven days, three ounces of extract of catechu in powder, two ounces of cinnamon bark bruised, in two pounds and a half of proof-spirit, and filtering through paper. This tincture is a solution of tannin, extractive matter, and the oil of cinnamon. The dose, in cases where astringents are required, is from fʒj to fʒij, taken in water or wine, or cretaceous mixture.

TINCTURE of Cinchona of the Lond. Ph., is obtained by macerating for fourteen days, seven ounces of lance-leaved cinchona bark in powder, in two pints of proof-spirit, and filtering.

The *tincture of cinchona* of the Edinb. and Dub. Ph. is had by digesting for seven days, four ounces of cinchona bark in powder, in two pounds and a half (two pints Dub.) of proof-spirit, and filtering through paper. The dose is from fʒj to fʒiv.

For the *compound tincture of cinchona,* see SNAKE-ROOT.

This is the same as the celebrated tincture of Huxham, who

TINCTURE.

who gave it in intermittents and low nervous fevers; in diluted wine or other proper vehicle, with 10 or 15 drops of elixir of vitriol (aromatic sulphuric acid, Edinb.) in doses of fʒj to fʒiij, or more in intermittents. See CINCHONA.

TINCTURE of Cinnamon of the Lond. and Dub. Ph., is obtained by macerating for fourteen days (seven days Dub.) three ounces of cinnamon bark bruised (three ounces and a half Dub.) in two pints of proof-spirit, and filtering. The dose, as a fit adjunct to the chalk mixture and astringent infusions, is from fʒj to fʒiij.

The *compound tincture of cinnamon* of the Lond. and Dub. Ph., is prepared by macerating for fourteen days (seven days Dub.) six drachms of cinnamon bark bruised, three drachms of cardamom seeds bruised, long-pepper powdered and ginger, of each two drachms, in two pints of proof-spirit, and filtering.

The *compound tincture of cinnamon* of Edinb. is formed by digesting for seven days, cinnamon bark bruised, lesser cardamom seeds bruised, of each one ounce, long-pepper in powder two drachms, in two pounds and a half of proof-spirit, and filtering through paper. This is beneficially used in flatulencies, atonic gout, languors, and debility, in doses of fʒj or fʒiij properly diluted.

TINCTURA Croci, or *Tincture of Saffron* of the Edinb. and Dub. Ph., is prepared by digesting for seven days, one ounce of English saffron cut in shreds in fifteen ounces (a pint Dub.) of proof-spirit, and filtering through paper. See CROCUS and SAFRON.

TINCTURE of Fox-glove (*Digitalis*) of the Lond. Ph., is obtained by macerating of fox-glove leaves dried (rejecting the large ones) and reduced to a coarse powder, two ounces, in a pint of proof-spirit, and filtering. The Dub. Ph. directs two ounces of fox-glove leaves (the larger ones rejected) dried and coarsely powdered, in a pint of proof-spirit, and then to filter.

The *tincture of fox-glove* of Edinb. Ph. is had by digesting for seven days, one ounce of fox-glove leaves dried, in eight ounces of proof-spirit, and filtering through paper. The dose of this tincture should be ℥ at first, and gradually increased.

TINCTURE of Galbanum of the Dub. Ph., is formed by digesting for seven days, two ounces of galbanum cut into small pieces, in two pints of proof-spirit, and then filtering. Used as tincture of assafœtida, but less nauseous and less powerful.

TINCTURE of Galls (Dub.) is prepared by macerating for seven days, four ounces of galls in powder, in two pints of proof-spirit, and then filtering. The dose, as an astringent, is from fʒj to fʒiij.

TINCTURE of Gentian, Compound, (Lond. and Dub.) is obtained by macerating for fourteen days (seven days Dub.) two ounces of gentian root cut, one ounce of orange-peel dried, half an ounce of cardamom seeds bruised, in two pints of proof-spirit, and filtering.

The *compound tincture of gentian*, commonly called "stomachic tincture," of Edinb. Ph., is prepared by digesting for seven days, two ounces of gentian root sliced and bruised, one ounce of orange-peel dried and bruised, half an ounce of canella alba bruised, half a drachm of cochineal in powder, in two pints and a half of proof-spirit, and filtering through paper. This is an elegant stomachic bitter and cordial, but in dyspepsia the infusion is preferable. See GENTIAN.

TINCTURE of Gold, See *AURUM Potabile*, and *Chemical History of GOLD*.

TINCTURE of Guaiac of the Lond. and Dub. Ph., is prepared by macerating for fourteen days (seven days Dub.)

half a pound of guaiac powdered (four ounces Dub.), in two pints of proof-spirit, and filtering.

The *tincture of guaiac* of the Edinb. Ph., is formed by digesting for seven days, one pound of guaiac powdered, in two pounds and a half of alcohol, and filtering through paper. Administered in the form of a draught, it must be triturated with yolk of egg or mucilage, that it may combine with water. The dose is from fʒj to fʒiij, in any convenient vehicle.

The *ammoniated tincture of guaiacum* of the Lond. and Dub. Ph., is obtained by macerating for fourteen days (seven days Edinb. and Dub.), four ounces of guaiac powdered, in two pints of compound spirit of ammonia, and filtering. The dose is from fʒj to fʒiij, triturated with any mucous or viscid matter. See *GUAIAACUM*.

TINCTURE of Black Hellebore of the Lond. Ph., is obtained by macerating for fourteen days, four ounces of the root of black hellebore sliced, in two pints of proof-spirit, and filtering.

The *tincture of black hellebore* of the Edinb. and Dub. Ph., is prepared by digesting for seven days, four ounces of black hellebore root bruised (powdered Dub.), half a drachm (two scruples Dub.) of cochineal in powder, in two pounds and a half (two pints Dub.) of proof-spirit, and filtering through paper. This tincture was regarded by Dr. Mead as a powerful emmenagogue, and is still ordered in uterine obstructions, and in some cutaneous affections. The dose is from ℥xxx to fʒj, in any appropriate vehicle. See *HELLEBORE*.

TINCTURE of White Hellebore. See *TINCTURA Veratri Albi*.

TINCTURE of Henbane of the Lond. Ph., is formed by macerating for fourteen days, four ounces of the dried leaves of henbane in two pints of proof-spirit, and filtering. The Dub. Ph. directs to digest for seven days, two ounces and a quarter of dried leaves of black henbane, in coarse powder, in a pint of proof-spirit, and then straining.

The *tincture of black henbane* of the Edinb. Ph. is had by digesting for seven days, one ounce of the dried leaves of black henbane in eight ounces of proof-spirit, and filtering through paper. In a dose of fʒj, it seldom fails of procuring sleep and quiet, and does not affect the head or produce costiveness. In cases of diarrhœa, a few drops of tincture of opium should be added to counteract its tendency to pass off by the bowels.

TINCTURE of Hops of the Lond. Ph., is formed by macerating for fourteen days, five ounces of hops in two pints of proof-spirit, and straining. This has been recommended as a substitute for tincture of opium in gout and rheumatism. The dose is from fʒs to fʒiij, or more. See *HOPS*.

TINCTURE of Jalap of the Lond. Ph., is made by macerating for fourteen days, two ounces of jalap root powdered, in two pints of proof-spirit, and filtering. The Dub. Ph. orders five ounces of jalap root in coarse powder, to be digested for seven days in two pints of proof-spirit, and then filtered.

The *tincture of jalap* of the Edinb. Ph. is formed by digesting for seven days, three ounces of jalap root in powder, in fifteen ounces of proof-spirit, and then filtering. See *JALAP*.

TINCTURE, Japonic. See *TINCTURE of Catechu*.

TINCTURE of Kino is obtained by macerating for fourteen days, three ounces of kino in powder, in two pints of proof-spirit, and filtering through paper. In the Edinb. and Dub. Ph. two ounces of kino (three ounces Dub.) are digested for two days in a pint and a half of proof-spirit, and filtered through paper. The dose is from fʒj to fʒiij.

TINCTURE of Lacta. See *LAC*.

TINCTURE.

TINCTURA Lytiæ, or *Tincture of Blistering Fly*. See LYTTÆ.

TINCTURA Martis cum Spiritu Salis, a medicine thus prepared: Take filings of iron, half a pound; Glauber's spirit of sea-salt, three pounds; digest all together without heat, as long as the spirit will work upon the filings; then, after the fæces have subsided, pour off the clear liquor, evaporating it to one pound, and adding of rectified spirit of wine three pints.

Some combine the acid and inflammable spirits first, and digest three ounces of iron-filings in a quart of the dulcified compound. A few drops of this tincture are a sufficient dose.

This tincture is good in all the cases in which the sal martis is so.

TINCTURE of Martial Flowers. See IRON.

TINCTURE of Metals, called *Lily of Paracelsus*, may be prepared by melting together in a crucible two parts of martial regulus of antimony, one part of fine tin, and one part of pure copper. The alloy thus compounded is to be powdered, when cold, and mixed with thrice its weight of purified nitre. The mixture is to be thrown, at different times, into a red-hot crucible, where it detonates, and is exposed to a violent fire, till the metals be perfectly reduced to calces. The matter is to be taken from the crucible, while red-hot, and immediately thrown into a heated iron mortar, where it is quickly powdered. The powder, while hot, is to be put into a matras, and upon it some rectified spirit of wine is to be poured to a height equal to the breadth of four fingers. The digestion is continued during some days, or till the spirit of wine has acquired a very deep yellowish-red colour. The spirit is to be decanted and kept in a bottle.

This tincture, although no part of the metals, reduced by calcination almost to the state of pure earths, can be dissolved by the spirit of urine, has a spirituous, saponaceous, acrid, and alkaline character, and has been successfully used, when the fibres and vessels require to be excited and animated, as in apoplexies, palsies, and dropries. It is also capable of accelerating the motion of the blood, and of increasing certain secretions and excretions, particularly sweat and urine. The dose is from six or twelve drops to forty, or even more, and must be administered in some proper cordial. Macquer's Dict. Chem.

TINCTURE of Muriate of Iron. See IRON.

TINCTURE of Musk of the Dub. Ph., is obtained by digesting for seven days, two drachms of musk in powder, in a pint of rectified spirit, and then straining.

Tincture of musk is directed, in the Edinb. Ph. of 1783, to be made by dissolving two drachms of musk, in a pound of rectified spirit.

TINCTURE of Myrrh of the Lond. Ph., is prepared by macerating for fourteen days, three ounces of myrrh bruised, in twenty-two fluid-ounces of rectified spirit, and a pint and a half of water, and filtering. The Edinb. Ph. directs three ounces of myrrh in powder to be digested for seven days, in twenty ounces of alcohol and ten ounces of water, and filtered through paper. The Dub. Ph. orders three ounces of myrrh bruised to be digested for seven days, in a pint and a half of proof-spirit and half a pint of rectified spirit, and then strained. This tincture is tonic and deobstruent; it is used now generally in gargles, combined with infusions of roses and acids; or applied to foul ulcers and exfoliating bones, or diluted with water, as a wash for the mouth when the gums are spongy. The dose is from ℥ʒss to ℥ʒj.

TINCTURE of Opium of the Lond. Ph., is formed by macerating for fourteen days, two ounces and a half of

hard opium powdered, in two pints of proof-spirit, and straining.

The *tincture of opium* of Edinb. Ph. or *Thebaic tincture*, or *liquid laudanum*, is obtained by macerating for seven days, two ounces of opium in two pounds of proof-spirit, and filtering through paper.

Tincture of opium, or *Thebaic tincture* of Dub. Ph. is prepared by digesting for seven days, ten drachms of purified hard opium in coarse powder, in a pint of proof-spirit, then straining. The usual dose is from ℥x to ℥℥x. In colica pictonum, ℥ʒj, given before purges, facilitates their action, and renders the relief more speedy; and in tetanus, ℥ʒʒs have been advantageously given in divided doses, in twenty-six hours. The tincture externally applied allays local pain, and assists in relaxing the spasm in lock-jaw and similar affections.

The *ammoniated tincture of opium* of the Edinb. Ph. is formed by digesting for seven days, in a close phial, three drachms of benzoic acid, and the same quantity of English saffron, cut in shreds, two drachms of opium, half a drachm of volatile oil of aniseed, in sixteen ounces of ammoniated alcohol, and filtering through paper. This tincture is used in hooping-coughs and spasmodic asthma. Each ℥ʒj contains gr. j of opium. See OPIUM.

TINCTURE of Quassia of the Dub. Ph., is obtained by digesting for seven days, an ounce of chips of quassia wood in two pints of proof-spirit.

TINCTURE of Rhubarb. See RHUBARB.

TINCTURE of Saffron. See *TINCTURA Croci*.

TINCTURE of Sena. See SENA.

TINCTURE of Salt of Tartar, is made by pouring some rectified spirits of wine, to a height equal to the breadth of three or four fingers, into a heated matras, that contains some hot salt of tartar, which has been previously fused in a crucible and powdered. The matras is to be closed, and the digestion continued for several days with a gentle heat, or till the spirit of wine has acquired a fine reddish-yellow colour.

This is essentially the same as tincture of metals, their medicinal qualities being the same.

TINCTURA Saturnina, the lead tincture, a name given in the late London Dispensatory to the tincture before called *tinctura antiphtisica*, because it was used to check the immoderate sweats in hectic complaints.

It is made of sugar of lead and green vitriol, of each two ounces, and of rectified spirit a quart. The salts are separately to be reduced to powder, and then put into the spirit, then the whole is to stand some days without heat to extract the tincture, and afterwards filtered through paper.

Many persons have found great perplexity in making this tincture, it having at first begun to shew a good colour, but afterwards lost it: this accident is owing to the heat usually employed in making the tincture.

This tincture is a powerful styptic, and is often used with good success in hectic fevers, spitting of blood, heat of the kidneys, simple gonorrhœas, fluor albus, and tabes dorsalis.

It was first recommended by Etmuller; who, from its effect, gave it the name of *tinctura antiphtisica*, which our College of Physicians changed to that of *tinctura saturnina*. The Edinb. Ph. directed it to be made of three ounces of the sugar and two of the vitriol, to a quart of spirit, and in the best of the foreign ones. Mr. Boyle recommends it, and our most eminent physicians formerly used it, notwithstanding that some authors consider it as a dangerous medicine, on account of its principal ingredient, the *saccharum saturni*, which some call a slow poison. Whether it be fo

or not when given in substance, it is certain that there is a great difference between a corrosive salt so given, and a tincture made of the same, in spirit of wine, and given in small doses, as Dr. Mead observes; who adds, that in slow hectic fevers attended with a looseness, profuse sweats, and a colliquation of the humours, he reckons two or three drachms, given at different times, in cooling liquors, every twenty-four hours, to be a convenient dose. But the usual dose was from fifteen to thirty drops in Bristol water, or some temperate or cool julep.

Concerning the danger of saturnine preparations, when applied to the purposes of internal medicine, see sir George Baker's Farther Observations on the Poison of Lead, in Med. Transf. vol. ii. p. 446, &c. See also COLICA *Damnoniorum*, LEAD, SACCHARUM Saturni, and VINEGAR of Lead.

TINCTURE of Snake-root. See SNAKE-ROOT.

TINCTURE of Soot. See SOOT.

TINCTURE of Squills. See SQUILLS.

TINCTURE of Spanish Flies, or *Tinctura Cantharides*. See TINCTURA *Lytice*.

TINCTURA *Styptica*, a form of medicine made with very little trouble and apparatus, and serving to supply the place of that elaborate preparation the tincture of Helvetius: it is prescribed in the late Lond. Ph., and is to be made by mixing a drachm of calcined green vitriol with a quart of French brandy tintured by the cask: this is to be shook together, that the brandy may turn black, and then strained off for use.

TINCTURE of Sulphur. See SULPHUR.

TINCTURA *Thebaica*. See TINCTURE of Opium.

TINCTURE of the Balsam of Tolu of the Edinb. Ph., is made by digesting an ounce and a half of the balsam in a pound of alcohol in a gentle heat, till the balsam is dissolved, and filtering through paper.

This tincture possesses all the virtues of the balsam; and in coughs, and other complaints of the breast, a tea-spoonful or two of it may be taken in a bit of loaf-sugar.

But it is chiefly used for making the syrup. An ounce of the tincture, properly mixed with two pounds of simple syrup, will make what is commonly called the *balsamic syrup*. See SYRUP.

TINCTURE of Valerian of the Lond. and Dub. Ph., is prepared by macerating for fourteen days (seven days Dub.) four ounces of valerian root in powder, in two pints of proof-spirit.

The ammoniated tincture of valerian of the Lond. Ph. is obtained by macerating for fourteen days, four ounces of valerian root in two pints of aromatic spirit of ammonia, and filtering. The Dub. Ph. directs two ounces of valerian root in powder to be digested for seven days in a pint of spirit of ammonia. It is beneficially employed in hysteria and other nervous affections, in doses of ℥ʒi, or ℥ʒij, given in milk, or some other bland fluid.

TINCTURA *Veratri Albi*, Tincture of White Hellebore, of the Edinb. Ph., is made by digesting for seven days, eight ounces of white hellebore-root bruised, in a pound and a half of proof-spirit, and filtering through paper. This tincture is employed to excite vomiting in maniacal and apoplectic cases, and as an alterative in cutaneous eruptions. It is given in doses of ℥v to ℥x; but its effects are sometimes very violent. Thomson's Dispensatory.

TINCTURA *Zingiberis*, or Tincture of Ginger, of the Lond. and Dub. Ph., is formed by macerating for fourteen days (seven days Dub.) two ounces of ginger-root sliced, in two pints of proof-spirit, and filtering. This is useful as a stimulant and carminative, in atonic gout when it attacks

the stomach, in flatulent colic, and as a corrector of griping purgatives.

TINCTURE is also applied by the *Heralds* to the colours used in escutcheons, or coats of arms; under which, with them, are likewise included the two metals, or and *argent*, because often represented by yellow and white. See COLOUR.

TINCTURE comprehends *colours* and *furs*.

The writers on heraldry have had great disputes, which of these colours or tinctures are the most honourable. All agree in giving the pre-eminence to the metals gold and silver, that is, to the yellow and white colours: as to the others, some esteem them more noble as they approach more to light, that is, to whiteness. Upton, on this account, ranges them thus: azure or blue, gules or red, purple or purple, vert or green, sable or black: others wholly dissent from this, and prefer those colours most which can be seen at the greatest distance; with these, sable or black is the most honourable or first colour; and they allege the imperial black eagle, placed in a white field, as an instance of this. Leigh prefers the red to the blue, as the red has some alliance to gold, and the blue to silver; the sable is generally preferred to green and purple, by those who give the red and blue the first places: it is in this esteem on account of its strong appearance; and green is preferred to purple, because the latter is but of very late use in heraldry, and is called a new colour.

All the precedence given to tinctures must however be considered with this special proviso, that there is no particular reason for bearing them otherwise in the arms of kingdoms and families. In all coats of arms there should be two colours or tinctures; and it is the general rule that the field should be of a nobler colour than the figures placed upon it: thus in the arms of Scotland the field is yellow, and the lion placed upon it red; and if the field consists of two different colours parted by fess or by pale, then the noblest colour must always be in the best place, as on the upper part, or on the right hand of the shield; but all these rules are to be understood with this limitation, that there are no other special reasons in the family for the contrary. Nesbit's Heraldry, p. 19.

The two metals, or and argent, and the four colours, black, red, blue, and green, (see COLOUR,) are the several tinctures, says Edmondson, of which the fields and all charges of arms ought in strictness to be made; excepting, however, such charges as are to be borne in their own proper or natural colour; which bearings, not having in blazon any particular technical or fixed terms, are all comprehended under the word *proper*. As to the tinctures *purpure*, *varony*, and *sanguine*, these, being mixtures, are now seldom, if ever, used, either for fields or charges, though they are ranked among those, which, as some whimsical heralds say, have mystical significations, and represent the *moral*, *political*, and *military* virtues of those who originally bore their arms so coloured or tintured. Some heralds, says the above-named writer, have blazoned the armorial colours in different terms, according to the rank and dignity of the person whose arms they are describing. Accordingly, the arms of gentlemen, esquires, knights, and baronets, are to be blazoned by tinctures; those of nobles by precious stones; and those of sovereign princes, kings, and emperors, by planets: but this mode of blazoning would, he thinks, introduce into the science of heraldry great absurdity and confusion, and render blazons in some cases very ridiculous.

TINCULEN, or TINEULEN, in *Geography*, a town of Africa, in the country of Darah; 120 miles S.W. of Tafilet.

TINDAL, MATTHEW, LL.D. in *Biography*, a reputed deist, was the son of a clergyman, and born at Beer-Ferres, in Devonshire, about the year 1657. From Lincoln college, Oxford, into which he was admitted in 1672, he was removed to Exeter college; and having graduated B.A., he was elected fellow of All-Souls college, and became LL.D. in 1685. About this time, the reign of James II., he was beset by some of the popish emissaries, who were then active and industrious in making profelytes, and converted to popery; but, upon farther examination, he returned to the church of England in 1687. To the revolution he was ardently attached; and having been admitted an advocate, he often sat as judge in the court of delegates, and had a pension from the crown of 200*l. per annum*. Tindal was both a political and theological writer, and under the latter description he published "A Letter to the Clergy of both Universities," on the subject of the Trinity and the Athanasian creed, with a view to some alterations in the Liturgy, which were subjects of discussion. But the treatise that attracted principal notice appeared in 1706, and was entitled "The Rights of the Christian Church asserted against the Romish and all other Priests who claim an independent Power over it; with a Preface, concerning the Government of the Church of England, as by Law established." This publication roused the animadversions of the high-church clergy, and the venders of it were legally indicted. The favourable notice taken of this work by Le Clerc, in his "Bibliothèque Choïsée," gave great offence to the lower house of convocation; and this learned body circulated a declaration, implicating the foreign critic, and others of similar sentiments, which Le Clerc himself, and many other persons, thought to be unjust and illiberal. Tindal also published a defence of his work, the second edition of which, in two parts, was ordered by a vote of the house of commons, to be burnt in the same fire with Sacheverel's sermons, in the year 1710. Some time after, the lower house of convocation, Atterbury being prolocutor, on a representation of the state of religion in the kingdom, animadverted on the dangerous consequences of the doctrine of necessity. To which Tindal replied, by asserting the truth and usefulness of that doctrine. Of the subjects and tendency of his political writings, it is now needless to give any account. It will be sufficient to observe that he was an advocate for the Hanoverian succession, and for the Whig ministry of that period. Hitherto Tindal had made no direct attack against religion; but in 1730 he no longer disguised his sentiments, which were announced to the public in a treatise entitled "Christianity as old as the Creation, or the Gospel a Republication of the Religion of Nature." He disclaims, indeed, in words, opposition to the divine authority of the Christian religion, and denominates himself and his friends "Christian Deists;" but in reality it was his evident and avowed purpose to shew, that there neither has been, nor can be, any external revelation distinct from what he terms "the internal revelation of the law of nature in the hearts of all mankind." Tindal was attacked by Dr. Waterland, who treated him with a degree of contempt which called forth the animadversions of Dr. Middleton. The author, though declining in health, wrote in his own defence, but concretions of the gall-bladder, with which he had been long afflicted, terminated his life in the year 1733. His remains were interred in Clerkenwell church, agreeably to his own desire, near those of Dr. Burnet, bishop of Salisbury. A second volume of his "Christianity as old as the Creation" was left in MS.; but the publication of it was prevented by Dr. Gibson, bishop of London. His first work had given occasion to so many unanswerable defences of Christianity, that the

learned bishop was unnecessarily alarmed, when he prevented further discussion of this interesting subject.

TINDAL, NICHOLAS, the nephew of the former, was educated at Exeter college, Oxford, and had different preferments in the church. He died in 1774, at a very advanced age, at Greenwich Hospital, of which he was chaplain. Among his literary undertakings, the most considerable was a translation of Rapin's History of England, with a continuation. *Biog. Brit.*

TINDALE. See **TYNDALE**.

TINDEL, in *Geography*, a town of Africa, in the country of Zenhaga, on the sea-coast; 18 miles S.S.E. of Cape Mirik.

TINDERCOTTA, a town of Hindoostan, in the Carnatic; 15 miles E. of Tiagar.

TINDERO, a town of Sweden, in the province of Medelpadia; 12 miles N.E. of Sundfwall.

TINE, in *Agriculture*, a term applied to a tooth or spike, which is set or placed in any kind of tool or implement, but especially those of the harrow, drag, and other similar kinds. Tines for this use should, for the most part, be a little curved or raked forward towards the points, as laying hold of the ground better, and in a more perfect manner. Sometimes tines are necessary to be steeled a little in the points and front edges, in order to prevent the wear of them, and render them more effective in tearing, cutting up, and dividing the land.

TINE, or *Tyne*, in *Geography*, a river of England, which rises in two streams, one called the North Tyne, which rises on the borders of Scotland, in the north-west part of the county of Northumberland; the other, which is called the South Tyne, rises about seven miles S. from Aldstone, in Cumberland: both these streams unite near Hexham, from whence the united stream proceeds to Newcastle, and from thence to the German sea, at Tinemouth.

TINEA, a river of France, which rises in the Alps, and runs into the Var, about 12 miles N. of Nice.

TINEA, in *Medicine*. See **PORRIGO**.

TINEA, in *Natural History*. See **MOTH**, &c.

TINEH, in *Geography*, a town of Egypt, situated between the fourth extremity of lake Menzaleh and the Mediterranean, near the ancient Pelusium, and on a canal formerly called the *Pelusian* or *Bubastic* mouth of the Nile; through which Alexander passed with his fleet from Gaza: this canal is now choked up with mud; 80 miles N.N.E. of Cairo. N. lat. 30° 48'. E. long. 38° 45'.—Also, a town of Africa, in Tripoli, on a river which runs into the gulf of Sidra. N. lat. 30° 5'. E. long. 19° 12'.

TINEHALY, a post-town of the county of Wicklow, Ireland; 41 miles S. by W. from Dublin.

TINEMAN, in our *Old Writers*, a petty officer in the forest, who had the nocturnal care of vert and venison, and other employments in the forest.

TINEMAR, in *Geography*, a town of Ceylon; 10 miles S.W. of Trinkamaly.

TINEMOUTH. See **TYNEMOUTH**.

TINET, **TINETTUM**, in our *Old Writers*, is used for brush-wood and thorns to make and repair hedges. In Herefordshire, to *tine* a gap in a hedge, is to fill it up with thorns, that cattle may not pass through it.

TINETO, in *Geography*, a small island near the coast of Genoa, at the entrance of the gulf of Spezza. See **TINO**.

TINEVELLY, or **PALAMCOTTA**, a city of Hindoostan, and capital of a province of the same name, in the Car-

natic; 74 miles S.S.W. of Madura. N. lat. 8° 42'. E. long. 77° 46'.

TINEVELLY, a province of Hindoostan, bounded on the N. by Madura, on the E. and S. by the gulf of Manara, and on the W. by Travancore, from which it is separated by the Ghauts. The coast of this state is called the Fishing Coast, and has long been celebrated for its pearls. It was formerly in possession of the Portuguese. The fisheries are carried on by the natives, but the Dutch claim the sovereignty, and send two or three frigates to protect the boats, which sometimes amount to hundreds. The revenues of the country belong to the nabob of Arcot.

TINEWALD, the parliament or annual convention of the people of the Isle of Man, of which this account is given: the governor and officers of that island do usually summon the twenty-four keys, being the chief commons of it, once every year, viz. upon Midsummer-day, at St. John's chapel, to the court kept there, called the tinewald-court; where, upon a hill near the said chapel, the inhabitants of the island stand round about the plain adjoining; and here the laws and ordinances, agreed upon in the chapel of St. John, are published and declared unto them. At this solemnity the lord of the island sits in a chair of state, with a royal canopy over his head, and a sword held before him, attended by the several degrees of the people, who sit on each side of him, &c.

TING, in *Geography*, a city of China, of the second rank, in Pe-tche-li, near the river Tam; 107 miles S.S.W. of Peking. N. lat. 38° 32'. E. long. 114° 39'.

TINGAM, a town of Hindoostan, in the circar of Aurungabad; 20 miles E.S.E. of Aurungabad.

TINGAMOLLY, a town of Hindoostan, in the circar of Ruttunpour; 6 miles W. of Kyragur.

TINGANO, a river of Malacca, which runs into the Chinese sea, N. lat. 5° 27'. E. long. 103° 9'.

TINGAU, or TINCH, a town of Bavaria, late belonging to the abbey of Kempten; 7 miles N.E. of Kempten.

TING-CHAN, a town of the kingdom of Corea; 30 miles S.E. of Haimen.

TINGENTERA, ALGÉCIRAZ, in *Ancient Geography*, a town of Spain, in Bætica, towards the S.W. It appears to have been the same town with that called by Antonine "Portus Albus," and "Julia Traducta." It was the native place of Pomponius Mela.

TING-FAN, in *Geography*, a city of China, of the second rank, in Kœi-tcheou; 992 miles S.S.W. of Peking. N. lat. 26° 5'. E. long. 106° 4'.

TING-HAI, a city and walled town of Chufan, on the coast of China, situated within a mile from the large open village or suburb, built along the shore. The way from the one to the other lies over a plain, intersected with rivulets and canals in various directions, and cultivated like a garden. The city walls are thirty feet high; and along these, at the distance of every hundred yards, are square stone towers. In the parapets are embrasures, and the holes in the merlons for archery, without cannon. The gate is double, and within it a guard-house, where military men were stationed, and the bows and arrows, pikes and matchlocks, were arranged in an orderly manner. Of the towns of Europe, Ting-hai most resembled Venice, on a smaller scale. The bridges are steep, and ascended by steps, like the Rialto; the streets are like alleys, or narrow passages, and paved with square flat stones. The houses are low, and mostly of one story. Attention to ornament was chiefly bestowed on the roofs of the houses; on the ridges of which were uncouth figures of animals, and other decorations in stone and in iron. The town was full of

shops, containing, chiefly, articles of clothing, food, and furniture, displayed to full advantage. Even coffins were exhibited to view in a variety of colours. The smaller quadrupeds, including dogs, intended for food, as well as poultry, were exposed alive for sale, as were fish in tubs of water, and eels in sand. The number of places where tin-leaf, and sticks of odoriferous wood were sold, for burning in their temples, indicated no slight degree of superstitious disposition in the people. Loose garments and trowsers were worn by both sexes; but the men had hats of straw, or cane, which covered the head, the hair, except one long lock, being cut short or shaved; while the women had theirs entire, and plaited and coiled, in a becoming manner, into a knot upon the crown of the head. Activity and labour universally prevailed. None asked alms, and none shunned labour. Staunton's Embassy to China, vol. i.

TINGI, a cluster of small islands in the Chinese sea, near the east coast of Malacca. N. lat. 2° 23'. E. long. 104° 21'.

TINGIA, a town of Peru, in the audience of Lima; 15 miles S.E. of Iça.

TINGIS, TANGIER, a town of Africa, situated upon a strait between the promontory, the coasts, and the mouth of the river Valon, according to Ptolemy, who furnished it Cæsarea. Mela says that it was a very ancient city, founded by the giant Antæus. It gave name to Mauritania *Tingitana*, of which it was the capital. Pliny says that it took the name of Julia Traducta, when the emperor Claudius sent thither a colony. Plutarch, in *Scrtorio*, calls it Tingena, and says that a son of Tinga by Hercules, called Sophax, founded it, and gave it the name after that of his mother.

TIN-GLASS, a name frequently given to the semi-metal bismuth.

TING-NGAN, in *Geography*, a town of China, of the third rank, in Quang-tong, on the river of Limou; 17 miles S. of Kiong-tcheou, in the island of Hai-nan.

TINGO, or TENNA, a river of Italy, which runs into the Adriatic, 3 miles N. of Fermo.

TINGORAN, a small island in the Chinese sea, near the coast of Malacca. N. lat. 4° 8'. E. long. 103° 33'.

TINGORCALLY, a town of Hindoostan, in Bengal; 40 miles W.S.W. of Calcutta. N. lat. 22° 9'. E. long. 87° 53'.

TINGRACALLY, a town of Bengal; 16 miles E. of Mahmudpour.

TINGRECOTTA, a town of Hindoostan, in Bara-maul; 18 miles S.E. of Darampoury.

TINGRI, a town of Thibet. Here the Nepaulese were defeated by the troops of China in 1792; 22 miles S.W. of Zuenga.

TING-TCHEOU, a city of China, of the first rank, in Fo-kien; 870 miles S. of Peking. N. lat. 25° 48'. E. long. 116° 4'.

TINGUIRICA, a river of Chili, which runs into the Rahel; 40 miles from its mouth.

TINGUZGALPA, a town of Mexico, in the province of Nicaragua; 80 miles N.W. of Leon.

TINGWALL, a town of the island of Shetland; 4 miles W.N.W. of Lerwick.

TINGWALLA, an island of Sweden, in the north part of the Wenner lake, on which the town of Carlstadt is built.

TINIA, or TENEAS, in *Ancient Geography*, a river of Italy, in Umbria, which, according to Silius Italicus, ran into the Tiber.

TINIAN,

TINIAN, in *Geography*, one of the Ladrone islands, in the North Pacific ocean, about 42 miles in circumference, first discovered by the crew of a Manilla ship, which was cast away here in the year 1638. The author of Anson's Voyage gives a pleasing description of this island, as found by the crew of the Centurion, in the year 1742. Commodore Byron, who visited it in the year 1765, and anchored on the south-west end of the island, in the same place where the Centurion lay; instead of delightful lawns, found the trees and underwood so thick, that in endeavouring to force a passage through, they were entangled and cut as if with whip-cord. After they had cleared the well, which they imagined was the same at which lord Anson filled his casks, commodore Byron found the water brackish, and full of worms. He says, "the road also where the ships lay was a dangerous situation at this season (August 1st), for the bottom is a hard sand, and large coral rocks; and the anchor having no hold in the sand, is in perpetual danger of being cut to pieces by the coral; to prevent which as much as possible, I rounded the cables, and buoyed them up with empty water-casks. Another precaution also was taught me by experience, for at first I moored, but finding the cables much damaged, I resolved to be single for the future, that by veering away, or heaving in, as we should have more or less wind, we might always keep them from being slack, and consequently from rubbing, and this expedient succeeded to my wish. At the full and change of the moon, a prodigious swell tumbles in here, so that I never saw ships at anchor roll so much as our's did while we lay here; and it once drove in from the westward with such violence, and broke so high upon the reef, that I was obliged to put to sea for a week; for if our cable had parted in the night, and the wind had been upon the shore, which sometimes happens for two or three days together, the ship must inevitably have been lost upon the rocks. I soon found that the island produced limes, four oranges, cocoa-nuts, bread-fruit, guavas, and paupaus in abundance; but we found no water-melons, scurvy-grass, or forrel. Notwithstanding the fatigue and distress that we had endured, and the various climates we had passed through, neither of the ships had yet lost a single man since their sailing from England, but while we lay here two died of fevers, a disease with which many were seized, though we all recovered very fast from the scurvy. I am indeed of opinion that this is one of the most unhealthy spots in the world, at least during the season in which we were here. The rains were violent, and almost incessant; and the heat so great as to endanger suffocation: besides the inconvenience which we suffered from the weather, we were incessantly tormented by the flies in the day, and by the musquitos in the night. The island also swarms with centipedes and scorpions, and a large black ant, scarcely inferior to either in the malignity of its bite. Besides these, here were venomous insects without numbers, altogether unknown to us, by which many of us suffered so severely, that we were afraid to lie down in our beds: nor were those on board in a much better situation than those on shore, for great numbers of these creatures being carried into the ship with the wood, they took possession of every birth, and left the poor seamen no place of rest either below or upon the deck. Our principal resource for fresh meat was the wild hog, with which the island abounds. These creatures are very fierce, and some of them so large, that a carcase frequently weighed 200 pounds. Mr. Gore, one of our mates, at last discovered a pleasant spot on the north-west part of the island, where cattle were in great plenty, and whence they might be brought to the tents by sea. We were now upon the whole

pretty well supplied with provisions, especially as we baked fresh bread every day for the sick; and the fatigue of our people being less, there were fewer ill with the fever; but several of them were so disordered by eating a very fine-looking fish which we caught here, that their recovery was for a long time doubtful." The author of lord Anson's voyage says, that the people on board the Centurion thought it prudent to abstain from fish, as the few which they caught at their first arrival surfeited those who eat of them. Besides the fruit that has been mentioned already, this island produces cotton and indigo in abundance, and would certainly be of great value if it were situated in the West Indies. The surgeon of the Tamar enclosed a large spot of ground here, and made a very pretty garden, but he did not stay long enough to derive any advantage from it. Captain Wallis touched upon this island in 1767; and obtained beef, pork, poultry, papaw apples, bread-fruit, limes, oranges, and every refreshment mentioned in the account of lord Anson's voyage. The sick began to recover as soon as they went on shore; but flesh meat would not keep sweet for scarcely one day. N. lat. 14° 55'. W. long. 214° 7'.

TINICUM, a township of Pennsylvania, in the county of Bucks, containing 1017 inhabitants; 20 miles N. of Philadelphia.—Also, a township of Pennsylvania, in the county of Delaware, containing 249 inhabitants.

TINIETZ, a town of Austrian Poland; 4 miles W. of Cracow.

TINIMA, a town of the island of Cuba; 22 miles W.N.W. of Bayamo.

TINING, in *Agriculture*. See **TINE**. See also **TILLAGE**.

TININGBURG, in *Geography*, a town of Hungary; 16 miles N. of Presburg.

TINISSI, a town of Bohemia, in the circle of Konigin-gratz; 10 miles S.E. of Konigin-gratz.

TINIT, a town of Africa, in Zanhaga, on the coast; 25 miles S.S.E. of Cape Mirik.

TINJULEEN, a town of Africa, in the country of Darah; 105 miles S.E. of Morocco. N. lat. 29° 30'. W. long. 5° 30'.

TINKER'S ISLAND, one of the Elizabeth's Islands, near the coast of America.

TINKLING or **TINGLING** of the Ear. See **TINNITUS**.

TINMOUTH, in *Geography*, a post-town of the state of Vermont, in the county of Rutland, containing 1001 inhabitants; 8 miles S. of Rutland.—Also, a town of Nova Scotia, on the east coast, formerly called *Piçou*.

TINNA, or **TINA**, in *Ancient Geography, a river of the isle of Albion, between the gulfs Tava and Boderia, according to Ptolemy, supposed to be the river Eden, in Fife.—Also, a small river of Italy, in Picenum.*

TINNE', in *Geography*, a town of Africa, in Masina, on the north side of the Niger; 130 miles W.S.W. of Tombuctoo.

TINNING, the covering or lining any thing with melted tin, or with tin reduced to a very thin leaf.

Looking-glasses are foliated or tinned with thin leaves of beaten tin, applied and fastened to them by means of quick-silver. See **LOOKING-GLASS**.

Kitchen utensils are tinned with melted tin; and locks, bits, spurs, &c. with leaf-tin, by the help of fire.

For the method of tinning iron-plates, see **LATTIN** and **TIN-Plates**.

Copper and brass are covered over with tin by the help of sal ammoniac, the acid of which cleans the surface of the

metals to be tinned, and the oily matter contained in it furnishes the phlogiston (according to the old system) that is necessary in this operation. The copper, or brass, being made hot enough to melt tin laid upon it, is strewed over with sal ammoniac, and the melted tin rubbed about the plate. The sal ammoniac takes up the dross of the tin, and leaves the tin to flow freely upon the metal. As the surface of copper is continually altered by the mere action of the air, the workmen, before the tinning of any vessel, scrape its surface with a steel instrument till it be clean and bright; then they place the vessel upon kindled coals, and heat it to a certain degree: as soon as it is hot, in some processes of tinning, they rub it with pitch, and apply the melted tin, which they spread upon the surface of the copper by means of hards. For this purpose pure tin is seldom used; but, in general, two parts of tin are alloyed with one part of lead.

The pitch used in this latter mode of tinning is quite necessary, because the degree of heat given to the copper is sufficient to calcine its surface in some degree: and this alteration, however slight, would prevent the perfect adhesion of the tin, unless by means of the pitch the phlogiston was restored to it at the very instant of the application of the tin. The pitch also prevents the slight calcination which would happen on the surface of the tin, or revives the small particles of calx which are formed during the operation. In either way, or in the method of tinning iron plates, the success of the operation depends on the facility with which tin unites with these metals, which incorporates with them, dissolves in some measure their surface, and forms a kind of alloy, at least when the tinning is well performed; and moreover, on the cleanness of the surfaces, both of the melted tin, and of the copper or iron to which it is applied; for the metals cannot perfectly unite unless they are in a metallic state, and free even from their own earth or calx.

It has been alleged that copper vessels, so pernicious in themselves, are not perfectly preserved from rust or verdigris by tinning; and, besides, tin itself is combined with arsenic, and lead is also used in tinning. M. Malouin has, therefore, proposed in his Memoirs on Zinc (Mem. de l'Acad. Sc. 1742.) to substitute that semi-metal in place of lead and tin, for the tinning of iron and copper vessels; the greater hardness of the zinc, it is thought, would render it less liable to be worn, and the dangerous effects of lead and tin would be avoided. Macquer's Dict. Chem. Engl. edit.

The plumbers, on some occasions, tin or whiten their sheets of lead: in order to which they have a tinning furnace, filled with live coal, at the two sides of which two men are placed, who hold up the sheets over the fire to heat: and the tin-leaves being laid over them, as fast as the sheets grow hot, and the tin melts, they spread it, and make it take by rubbing it with tow and resin.

TINNITUS AURIUM. A very common disease in the sense of hearing, is when certain sounds, like those of a drum, a bell, the falling of water, &c. are heard, when no such noises actually exist, or can be heard by other persons. This affection is called *tinnitus aurium*, of which various kinds have been observed. For the most part, it is a very slight transient disorder; but sometimes it is most obstinate, long continued, and troublesome. It sometimes arises from the slightest cause, such as any thing partially stopping up the meatus auditorius, or Eustachian tube itself, so that the free passage of air into the cavity of the tympanum is interrupted. A kind of tinnitus is heard by the most healthy when they yawn.

A much more frequent and troublesome species of tinnitus accompanies many diseases both of the febrile and nervous kind. This is said to be occasioned partly by the

increased impetus of the blood towards the head, with an increase of sensibility in the nervous system itself, so that the very beatings of the arteries are heard; and partly by the augmented irritability and spasmodic motions of the little muscles within the organ of hearing. In fevers, the throbbing of the carotid arteries at the sides of the sella turcica has produced excessive annoyance in particular individuals, especially when they were in the recumbent posture; and the celebrated Haller informs us, that when he was afflicted with fever, he suffered much from the beating sensation caused in his ears, as he supposed, from the pulsation of the carotids in the neighbourhood of those organs.

According to writers, tinnitus aurium sometimes arises from a vehement affection of the mind; sometimes from a disorder in the stomach; sometimes from rheumatism extending its effects to the ears and head; or from a catarrh, producing a temporary obstruction in the Eustachian tube. In the foregoing examples, the cure of the affection of the ear depends upon the removal of the other disorders, of which it is merely an effect.

In certain cases, tinnitus aurium occurs as a separate independent disorder, and may be the cause of long-continued, distressing suffering. The existence of unreal sounds in the organ of hearing generally prevents the patient from hearing distinctly other sonorous impressions, and, of course, more or less deafness is a common attendant of the complaint.

The writer of this article lately had a patient, who is attacked five or six times every year with tinnitus aurium, which causes for several days the most annoying sensations in the ears, and a considerable degree of deafness. The disorder is always accompanied with severe pain in the branches of the nerve coming out of the infra-orbital foramen, head-ache, indigestion, and many symptoms of the nervous and bilious kind.

In this case, relief is obtained by fomenting the affected ear with a decoction of poppies, and washing out the meatus auditorius with a syringe and warm water. However, these means are always assisted with a few doses of calomel and rhubarb, without which, in all probability, the local applications would not entirely answer.

We have also had other cases, in which a strong solution of opium in water, camphorated oil, blisters, &c. were the remedies employed.

The tinnitus aurium, produced by fevers, sometimes does not subside at their termination, but lasts, either in a continued or periodical form, during life. Two such instances are now within our own recollection; and every man of experience must have witnessed the same thing.

TINNUNCULUS, in *Ornithology*, the name of one of the long-winged hawks, called by Linnæus *FALCO tinnunculus*; which see.

It is about the size of a common pigeon. Its bill is short, crooked, and very sharp, and covered with yellow skin at the top; near this the bill is white, elsewhere it is blue; its tongue is bifid; its mouth very wide, and its palate blue; its head is large and flattened, and is of an ash-colour, with longitudinal streaks of black; its back and wings are brown, variegated with black spots; its rump is grey, with some transverse black spots; and its breast and belly of a pale rust-colour, with a few longitudinal streaks of black; its tail is long and pointed, its tip of a pale ferruginous hue, with a broad transverse streak of black over it; and the rest of the tail is a mixed grey and brown, with black spots and streaks; its legs and feet are of a fine yellow.

The tinnunculus, or kestrel, breeds in the hollows of trees, in the holes of high rocks, towers, and ruined buildings:

buildings: it lays four eggs, which are white, variegated with a number of red spots; its food is field-mice, small birds, and insects.

This is the hawk which we so frequently observe in the air fixed in one place, and as it were fanning with its wings, at which time it is watching for its prey. It flings up the indigested fur and feathers in form of a round ball. Ray and Pennant.

TINO, in *Geography*, a small island near the coast of Genoa, at the entrance of the gulf of Spezza; 8 miles S. of Spezza. N. lat. 44° 3'. E. long. 9° 40'. See TINETO.

TINO. See TENOS.

The form of this island is oval, about 60 miles in circumference. It is mountainous, but its rich plains are decked by the opulence of industry. Its fruits are excellent and its wine good; but the most abundant of its productions is silk, which is manufactured by the females, who are highly commended for the beauty of their persons and the elegance of their dress. The inhabitants are active and industrious, most of whom are of the Greek church, though it is the see of a Roman Catholic bishop. It is reckoned one of the most agreeable islands of Greece, but has no good harbour. The small town of San Nicolo is built on the ruins of the ancient Tenos. Its capital bears the name of the island. N. lat. 37° 36'. E. long. 25° 7'.

TINPHADUM, or TIMPHADUM, in *Ancient Geography*, a place of Africa, in Numidia, upon the route from Theveste to Sitifis, between Theveste and Vegefela. Ant. Itin.

TINSEDA, in *Geography*, a town of Africa, in the country of Darah. N. lat. 27° 30'. W. long. 5° 46'.

TINTA, a town of Peru, in the bishopric of Cusco, and jurisdiction of Canas y Canches, sometimes also called Tinta; 60 miles S. of Cusco.

TINTENIAC, a town of France, in the department of the Ille and Vilaine; 9 miles S.S.E. of Dinan.

TINTINNABULUM, among the *Ancients*. See BELL.

TINTO, in *Geography*, a river of Spain, in the province of Seville, which owes its name to its waters being tinged of a yellow colour. It is also of a petrifying quality; and it is said that it destroys all verdure, and that no fish can live in it. Its nature, however, is changed by the confluence of other rivulets; for when it passes by Niebla, it is not different from other rivers: and it falls into the Atlantic, six leagues lower down, at the town of Huelva, where it is two leagues broad, and admits the passage of large vessels as high as San Juan del Puerto, three leagues above Huelva.

TINTON, a town of the state of New Jersey, near the sea; 12 miles E. of Freehold, in the county of Monmouth.

TINTOQUE, a town of Mexico, in the province of Xalisco; 45 miles S.S.W. of Compostella.

TINTORETTO, IL, in *Biography*, the cognomen of a celebrated Venetian painter, whose real name was Giacopo Robusti. He was born at Venice in 1512, the son of a dyer; from whence he acquired the name of Il Tintoretto. His natural disposition towards the art of drawing manifested itself very early, and his father had the wisdom to indulge it; and seeing it likely to lead to something decisive, caused him to be instructed in painting, and finally placed him as a pupil with Titian, then in the prime enjoyment of his reputation and power. It is a painful thing to relate, and a severe lesson to the pride of the most able, that where so much ability, so much honour and wealth abode, the mean and degrading passion of jealousy should have found encouragement. Titian, the great, the honoured Titian, that man who possessed a mind capable of grasping almost all the art of painting required, who was richly and highly honoured, courted, and employed, is said (and the truth of

the story rests upon too sound authority) to have seen with the corroding pangs of jealousy the early essays of his pupil Tintoretto, and to have permitted it to operate so strongly upon him, that he excluded the dreaded object from his house, about ten days after his admission.

But the aspiring talents of the young painter were not to be damped by so mean a measure, though even in the powerful hands of Titian. To him dismissal from the eye of a master was emancipation. He dared to think for himself, and boldly aimed at selection in art, and an union unthought of till then; and as Lanzi says, generously aspired at the honour of being the founder of a school and style of his own, by combining the form of the great Florentine, M. Angelo, with the colour of his former master. To maintain a due excitation to the performance of so bold an undertaking, he wrote upon the wall of his study, "Il disegno di Michel Angelo e il colorito di Tiziano;" and with all the ardour of an intrepid mind, endeavoured to perfect the task he had assigned himself, by copying whatever pictures of Titian he could procure during the day, and drawing by night from casts taken from the works of M. Angelo, together with many others he procured from ancient basso-relievos and statues. It is doubtless to his studies by night and the lamp, that he acquired that perfect mastery of chiaro-scuro, those decided masses of light and shade, which distinguish his works, both in their groups and single figures. Add to these labours, that he modelled in wax and clay, and clothed his figures studiously, arranging them in different lights, and sometimes hanging them from the ceiling, to acquire, by drawing from them in that position, the knowledge of the *sotto in su*, then much in use for the adornment of ceilings, and in the houses of the grandes. By these deep studies, and a perfect knowledge of anatomy, he was enabled to exert the exuberant and glowing fancy with which nature had blessed him, in the freest and boldest manner; and had he always applied his powers with equal intenseness, with a careful discrimination of what was due to his own honour, there can be no doubt but that he would have left a name unrivalled in art. This for some time he attended to, and some of his best works lack only character and expression to place them in the highest rank. The large picture which lately adorned the walls of the Louvre, but is now returned to its original station, the Scuola di S. Marco at Venice, is a work of this class, which he painted when only 36 years old; and another is the Crucifixion, in the Scuola di S. Rocco. The former is known by the name of Il Servo, and represents the miracle of St. Mark descending, and breaking the bonds of a slave condemned to death by Turks. Grand but not correct in its style of design, astonishing the mind by the intrepid boldness of its colour and execution, it displays more complete mastery of the materials of art than is to be found in the works of any other painter. If there be any fault in this astonishing performance, it is that the subject is lost in the splendour of the execution, the spirit in the matter in which it is embodied. The same cannot be said of the Crucifixion above mentioned, in which the lowering deep and ominous tone preserved through the whole, produces the most perfect unity, gives strength of expression to the picture, and overwhelms the spectator with terror. All seems to be hushed in silence round the central figure of the Saviour suspended on the cross, with his fainting mother, and a group of male and female mourners at his feet; and though many are the improprieties of costume and of action, yet all vanish in the power which compresses them to a single point, and we do not detect them till we recover from the first impression. Unhappily for his fame, he was not always so careful in his labours;

labours; and the impetuosity of his mind, or perhaps the feelings of his employers, who were numerous, did not allow him sufficient time to do justice to himself; and he permitted many pictures to leave his easel, possessing only the freedom of colour and execution which peculiarly belonged to his pencil.

Tintoretto was so certain of his execution, that he is said by Sandrart to have frequently wrought without a previous sketch, or any preparatory outline, finishing as he went on, and adapting his labours to the price he was to receive; not sufficiently considering that his works would outlive their author, and deprive him of a large portion of the fame so justly due to his power, when efficiently exercised. It was, therefore, truly observed by An. Caracci, that in some of his works, Tintoretto was not inferior to Titian, while in others he fell below himself.

One remarkable instance of his intrepidity and impetuosity of genius, and promptness of execution, is related by Vafari, viz.: The confraternity of S. Rocco at Venice had determined to decorate their church with a picture of the apotheosis of their patron saint, and, desirous of having the choice of good designs, commissioned some of the most eminent artists to make compositions for their selection. Paulo Veronese, A. Schiavone, Salviati, Zuccheri, and Tintoretto, were the competitors. On the day appointed for their decision, the good fathers were astonished to find a finished picture by Tintoretto placed in the appointed situation; and when they remonstrated upon so extraordinary a proceeding, as they had only required a design from him, he told them that was his way of making designs, and that if they hesitated to pay him for his trouble, they were welcome to the picture, which was allowed to keep possession of its honours. His competitors rendered due justice to so extraordinary an exertion, and denominated him *Il furioso Tintoretto*.

To do justice to the power of Tintoretto, he must be contemplated on the grand theatre of his pictorial existence, viz. at Venice, where alone his grander works are to be found; and there the public buildings are filled with them, in the higher and lower degrees of excellence. In style, the grandeur which he borrowed of Michael Angelo was rather muscular enlargement of line, and that not always correct, than select or characteristic; and it is not often that he rises above common nature; mostly so in his female characters, though they are often too slender for truth of action, and too affected for grace. His touch is delightfully free, with a full impasto of colour, and his chiaro-scuro of the richest and most brilliant kind. He lived to the great age of 82, and died at Venice in 1594.

Tintoretto left a daughter named Marietta Robusti, who was born at Venice in 1560, and whom he instructed in the art of painting, principally in portraiture, in which she acquired considerable practice and reputation; painting many of the principal personages in her native city. She had the honour to be invited to the courts of the emperor Maximilian and of Philip king of Spain; but her father would not be prevailed upon to part with her. She died soon after him, in 1590. He left also a son, Domenico Robusti, who practised the art with considerable success, though not with the fire of invention or execution which characterize his father's productions. He was born at Venice also, in 1562. His principal works are in the Sala di Consiglio and the Scuola di San Marco at Venice. Portraiture was, however, his principal occupation, and most suited to his genius; and he had the honour of being eminently patronized. He died in 1637.

TINURTIUM, TOURNUS, in *Ancient Geography*, a

town of Gaul, on the route from Lugdunum to Geforiacum. Anton. Itin.

TINUS, in *Botany*, a name in Pliny, book 15, chap 30, for what he says is sometimes termed a sort of wild laurel, and is distinguished by the blue colour of its berries. This description is universally agreed to apply to our *Laurus-tinus*, *Viburnum Tinus* of Linnæus; a plant likewise indicated by Ovid's

Et bicolor myrtus, et baccis cærulea tinus.

Linnæus has transferred this name to a West Indian shrub, supposed by him to constitute a new genus, having some resemblance to the above shrub.—Linn. Gen. 200. Schreb. 270. Juss. 264 and 451.—Class and order, *Enneandria Monogynia*.

The characters of this however were discovered by Swartz to be founded in error, the plant being a genuine species of *CLETHRA*; see that article, n. 5.

The origin of the word *Tinus* has been sought by Vaillant in the Greek *τινος*, *small*, or *dwarf*, as meaning a smaller or more humble kind of laurel; but this is scarcely correct, nor does the derivation by any means satisfy us.

TINZ, in *Geography*, a town of Silesia, in the principality of Brieg; 22 miles W. of Brieg.

TINZULIN. See TINJULEEN.

TIO, a town of South America, in the province of Cordova; 70 miles E. of Cordova.

TIOGA, a county of New York, erected from Montgomery county in 1791, and from the E. part of this county. The county of Brome was erected in 1806. Tioga is bounded N. by a small angle of Steuben county, and by Seneca and Cayuga counties, E. by Brome county, S. by the state of Pennsylvania, and W. by Steuben county. Its form is nearly that of a square, 26 by 34 miles; its area 571,306 acres: between 42° and 42° 25' N. lat., and 2° 14' and 3° W. long. from New York. Its towns are Condon, Caroline, Catharinas, Cayuta, Chemung, Denby, Elmira, Owego, and Spencer its capital. Its eastern part is traversed by the Susquehanna; and the Tioga, the principal W. branch of that river, waters the S.W. part. The surface is considerably broken and hilly. It is rapidly increasing in population, and contains a large proportion of good farming land. Rafts, arks, and small boats descend the waters of this county, and find the principal market at Baltimore, in Maryland. Tioga sends one member to the house of assembly.

TIOGA, a large township in the S.W. corner of Brome county, 13 miles W. of Chenango Point; bounded N. by Berkshire, E. by Union, S. by the state of Pennsylvania, and W. by Tioga county; about 15 miles long from N. to S., and 7 broad, having the Susquehanna running W. across its centre. The soil is various, and the surface uneven. It yields various kinds of trees, grain, and pasture. Fruit in general succeeds well, and apples are no where better. This town has been settled since about 1790.—Also, a river of New York, which runs into the Susquehanna at Tioga Point, N. lat. 41° 56'. W. long. 76° 33'.

TIOLO, a town of Italy, in the Valteline; 10 miles S.W. of Bormio.

TION, a river of France, which runs from the lake of Anney to the Siers.

TIOOKEA, one of King George's islands, in the South Pacific ocean, discovered by commodore Byron. It is a low island, with a large lake in the centre. Captain Cook sent to examine a creek, which he supposed communicated with the lake. They found the creek fifty fathoms wide at the entrance, and thirty deep; farther in thirty wide and twelve deep; the bottom every where rocky, and the sides bounded with coral rocks: dogs seemed to be in great plenty, but no fruit

fruit was seen but cocoa-nuts. The inhabitants of this island, and perhaps of all the low ones, are of a much darker colour than those of the higher islands, and seem to be of a more savage disposition. This may be owing to their situation, nature not having bestowed her favours on these low islands with that profusion she had done to some of the others. The inhabitants are chiefly beholden to the sea for their subsistence; consequently are much exposed to the sun and weather, and by that means become more dark in colour, and more hardy and robust, for there is no doubt of their being of the same nation. Captain Cook's people observed that they were stout well-made men, and had marked on their bodies the figure of a fish, a very good emblem of their profession. S. lat. $14^{\circ} 27'$. W. long. $144^{\circ} 56'$.

TIORA, in *Ancient Geography*, a town of Italy, in the country of the Sabines, on the route from Reate to Liſta, between Vatia and Liſta.

TIORN, in *Geography*, an island in the North sea, near the west coast of Sweden, about 25 miles in circumference, containing three parishes, and abounding in excellent pastures. N. lat. 58° . E. long. $11^{\circ} 29'$.

TIORNEBIERG, a small island in the Baltic, near the fourth coast of Laland. N. lat. $54^{\circ} 42'$. E. long. $11^{\circ} 18'$.

TIORNEHOLM, a small island in the Baltic, near the fourth coast of Laland. N. lat. $54^{\circ} 39'$. E. long. $11^{\circ} 37'$.

TIOS, **TIEUM**, or *Tion*, in *Ancient Geography*, a town of Asia, in Paphlagonia, which lay, according to Ptolemy, on the coast of the Euxine sea, between Pſyllium and the mouth of the river Parthenius.

TIOUGHNIOGA, in *Geography*, a river of New York, which runs into the Chenango, N. lat. $41^{\circ} 56'$. W. long. $76^{\circ} 53'$.

TIPARA, a town of Hindooſtan, in Oude; 10 miles S.E. of Gooracpou.

TIPARENUS INSULA, now *Specia*, in *Ancient Geography*, the iſle of Tiparena, ſituated in the Argolic gulf, ſeparated by a ſmall canal from the continent, which eſta- bliſhed a communication between the gulfs Hermione and Argolic.

TIPASA, **TIPSA**, a town of Africa, in Mauritania Cæſariana, according to Ptolemy and the Itin. Anton. having the title of colony, and ſituated on the route from Carthage to Tingis, between Cæſarea Colonia and Cafæ Caluenti. It ſtill preſerves its ancient port, and has ſome remains of ancient walls.

TIPE, or **TYPE**, in *Rural Economy*, a trap or device of the wooden box, or excavated earth kind, for catching or taking rabbits, &c. Theſe tipes or traps are ſet or formed in a particular track at the time the rabbits have departed from the warrens, or parts of them, in ſearch of food, all the other holes or ways of return being ſtopped up. Dogs are then employed in forcing the rabbits to return, when they are taken in the tipes or traps. The tipes are formed of different numbers and ſizes, according to the nature and extent of the warren.

TIPER, or **TIPRA**, in *Geography*, a country of Asia, annexed to Bengal, bounded on the N. by Silhet, on the E. by Ava, on the S. by Chittigong, and on the W. by Dacca, about 100 miles long, and 50 broad: the inhabitants are ſaid to be moſt ſubject to goitres or wens in the throat, a diſeaſe generally attributed to the water drank. Comillah ſeems the chief town. A town of the ſame name is laid down in ſome maps, as ſituated on the river. N. lat. $24^{\circ} 20'$. E. long. 110° .

TIPHA, in *Ancient Geography*, a ſmall town of Greece, in Bœotia, ſituated on the gulf of Corinth, in which was a

temple of Hercules, whoſe feaſt was annually celebrated. Pauſanias.

TIPHCA PRINCEPS, one of the Hebrew accents, ſometimes ſerving for a comma, and marked under a letter thus (^c).

TIPHIA, in *Entomology*, a genus of the Hymenoptera order of insects, in the Gmelinian ſyſtem of Linnæus; the characters of which are, that the mouth has a membranaceous roundiſh jaw, a mandible arched, and acute, a ſhort tridentated lip, and no tongue; the feelers are four, filiform, unequal, ſtretched out in the middle of the lip; and the antennæ un- filiform and arched. This genus includes the following

Species.

VESPIFORMIS. Black, with a ferruginous abdomen, black at the baſe, and cyaneous wings. The ſphex *vespi- formis* of Fabricius. Found in Malabar.

CRASSICORNIS. Black, the abdomen with three bands, the legs ferruginous, and the wings cyaneous. Found in Spain.

NIGRA. Black, without ſpots. An European infect.

FEMORATA. Black, with the four hinder thighs angu- lated and red. Found in England.

HISTRIONICA. Black, thorax maculated, abdomen with five yellow bands, the two foremoſt interrupted. Found in China.

QUINQUECINCTA. Black, thorax ſpotted, abdomen with five yellow bands, the ſecond interrupted. Found in England.

VARIEGATA. Thorax black, varied with yellow, ab- domen yellow. A Siberian infect.

CECATA. Black, the ſegments of the abdomen yellow, with ciliated margin. Found in Spain.

HÆMORRHOIDALIS. Black, the abdomen with five yel- low ſpots on each ſide, the toes and legs red. Found in South America.

EPIHIPPIUM. Black, the thorax with a red dorsal ſpot. Found in South America.

RADULA. Hairs black, thorax reddiſh before, the ſecond and third ſegments of the abdomen yellow. Found in New Holland.

DORSATA. Black, the ſecond and third ſegments of the abdomen yellow. A Coromandel infect.

RUFICORNIS. Ferruginous ſpotted with black, yellow abdomen, and four black bands. Found in Tranquebar.

TRICINCTA. Black, the abdomen with three yellow bands, the anus and legs ferruginous. Found in South America.

COLLARIS. Black, the thorax on the fore-part cinereous villous, behind reſuſe, with cinereous wings. Found in Malabar.

MORIO. Black, with brown wings, poſterior thighs banded with cinereous. Found in Spain.

PEDESTRIS. Apterous, black variegated with yellow, thorax compressed. Found in New Holland.

TIPHLE, in *Ichthyology*, a name by which ſome authors expreſs the acus, or tobacco-pipe fiſh.

TIPICA, in *Geography*, a town of Peru; 30 miles E. of Lipes.

TIPING, a town of Corea; 25 miles S.E. of King- ki-tao.

TIPIOCA, or **TAPIOCA**, a name given by ſome authors to a ſort of cream or flour made from the yuca or manihot- root, by maceration of it in water, after expreſſing the juice.

TIPOR, in *Geography*, a town on the weſt coaſt of Celebes. S. lat. $2^{\circ} 5'$. E. long. $119^{\circ} 22'$.

TIPPACANOE CREEK, a river of North America, which

which runs into the Wabash, N. lat. 40° 18'. W. long. 86° 56'.

TIPPAI, a river of England, in Northumberland, which runs into the Tyne, near Haltwhistle.

TIPPERARY, a county in the province of Munster, Ireland, extending in a very irregular form between the King's and Queen's counties on the north, the latter county and that of Kilkenny on the east, the counties of Waterford and Cork on the south, and those of Limerick, Clare, and Galway on the west. From the two latter counties, the river Shannon forms a natural boundary; as the river Suir does from Waterford for about 15 miles on the south. The length from north to south is 52 Irish (or $73\frac{1}{2}$ English) miles, and its breadth 31 Irish (or $39\frac{1}{2}$ English) miles. It contains 554,950 acres, or 867 square Irish miles, equal to 882,398 acres, or 1420 square English miles, including bogs, mountain, and waste. There are twelve baronies, two of which, Upper and Lower Ormond, gave the title of duke, as they now do that of earl, to the family of Boteler, or Butler, so distinguished in Irish history. The population of Ireland not having yet been satisfactorily ascertained, little can be said on the subject. Dr. Beaufort stated the number of houses in 1792, at 30,703; and from the means of information he had, and his usual accuracy, there can be little doubt of his correctness: but from the great increase of tillage since that time, the number of houses must have increased, though Tipperary has had more causes to retard this increase than any other county in Ireland: 30,703 houses, at an average of 5½ souls *per* house, would be about 169,000; but if, according to Mr. Bushe's opinion, as given in the Transactions of the Irish Academy, we take 6½ as the average, it would exceed 190,000, a very small population for such an extent of ground. The number of parishes is 187, which, when Dr. Beaufort wrote, were comprised in 63 benefices, and had only 46 churches. A number of churches have however been since built, as well as several glebe-houses, and some benefices have been divided; to which the exertions of the present archbishop of Cashel (Brodrick) have greatly contributed. Unions of parishes which were formed, when from the state of the country the income of a parish was very small, and the number of inhabitants very few, are now as unnecessary as they are injurious. The archbishopric of Cashel, and bishopric of Emly, which are united, contain 116 parishes, Waterford 32, and Kilkaloe 41. Tipperary returns four members to the imperial parliament, two knights of the shire, and two for the boroughs of Clonmell and Cashel. This reduction was less than in most other counties, as Tipperary had only three boroughs before the Union, of which Featherd was disfranchised. Though the towns represented are considerable ones, especially Clonmell, yet the boroughs are both what are called *close* ones, the proprietors in fact exercising an undisputed right of chusing the member. The lands of Tipperary have been always ranked amongst the most productive in Ireland, and one tract in particular, including the neighbourhoods of Tipperary and Cashel, has been called the *Golden vale*, on account of its extraordinary fertility. It has however been always a great grazing country; and as this system drives the peasantry into barren mountains, or forces them to crowd into towns and villages, that they may procure a precarious and wretched subsistence, they too commonly become turbulent, violent, and discontented. Whether this be the cause or not, such is certainly the character of the peasantry of this county, who have been engaged in every disturbance, and who are now groaning under an insurrection act, attended with enormous expence, which the usual parliamentary opponents of government could not

object to, and which, though there is an apparent calm, it would be yet unsafe to repeal. The increase of tillage would operate favourably, but the exemption of grazing land from every kind of tithe, operates as an encouragement to it, which the present state of the market for grain is not likely to counteract. Whilst, however, Tipperary contains a considerable portion of very fertile land, it has also extensive tracts of bog and mountain. Of the former, the most extensive is a tract lying in the north-east of the county, between the towns of Roscrea, Templemore, Urlingford, Littleton, and New Birmingham, and forming a part of the Great Bog of Allen. This was surveyed by Mr. Ather, of Castle-comer, under the directions of the commissioners for enquiring into the nature, extent, &c. of the bogs of Ireland; and from his report it would appear, that about 36,000 acres, mostly in this county, might be easily reclaimed, and at a moderate expence, on account of the favourable situation for draining, and the abundance of limestone gravel, of which the district is principally composed, and which is the best material for reclaiming them. To the south of this range of bog, and situated between the small town of Killenaule and the county of Kilkenny, is the coal district. It resembles what has been called the Leinster coal district in the very able geological and mining report lately given of that district by Richard Griffith, esq. mining engineer to the Dublin Society. It seems indeed to be only a continuation of that district, and is separated from it by a secondary limestone country. The species of coal is the carbonaceous or stone-coal, better known by the name of Kilkenny coal. To the south of this, and in the south-eastern angle of the county, is Sliebh-na-man mountain. On the borders of the county of Waterford, over the town of Cloghen, are the Knockmele-down mountains, which occupy a considerable space in both counties. Nearly parallel to these, and north of them, are the lofty Galtees, extending from the borders of Cork and Limerick to the town of Cahier. Between these and the town of Tipperary is the lower range, called Sliebh-na-muck; but the greatest extent of mountain crosses the county from south-west to north-east, running from the county of Limerick to the Queen's county, and completely separating the two Ormonds from the rest of the county. The high hills adjoining Limerick are called the Keepe mountains, from the height of them, which is a remarkable object to the traveller and the adjoining country. The hills near the small town of Silvermines, have been marked in some maps as the Silvermines mountains; others have been called the Devil's Bit; and adjoining the Queen's county, they take the name of the Sliebh-bloom mountains. In this district, lead and copper mines have been wrought with various success; and some parts of it afford fine mill-stones. The river Suir rises in the north of the county, near Roscrea, and flows from north to south, when it takes an eastern direction, and becomes the boundary between it and Waterford. This and its tributary streams afford an abundant supply of water; and turn a very great number of boulding-mills. The western division of the county has the Shannon for its boundary, and is well watered by the streams which flow to it from the range of mountains above mentioned. Clonmell, on the Suir, and at the southern extremity of the county, is the shire-town, and though very inconveniently situated for the assizes, has an excellent gaol, court-house, &c. It is a place of considerable trade, and one of the principal inland towns of Ireland. Cashel, Roscrea, Nenagh, Tipperary, Carrick, and some others mentioned in their proper places, are of respectable size, but none of them distinguished for trade or manufactures, unless we except the manufacture of

ratteens at Carrick. Tipperary was, previous to the arrival of the English, a part of the kingdom of Munster; sometimes separated as an independent sovereignty under the kings or princes of Cashel. The name Ormond is a corruption of Oir Momond, *i. e.* East Munster, and was so called in opposition to Desmond, South Munster, and Thomond, North Munster. After the English settlement, the O'Briens were confined to Thomond, the Fitzgeralds established themselves in Desmond, and the Butlers became the possessors of Ormond and Kilkenny, acknowledging indeed the sovereignty of England, but maintaining such authority as rendered it only nominal. The counties of Kilkenny and Tipperary were palatinates; and it was not till the attainment of the duke of Ormond, in 1716, that this distinct jurisdiction was abolished. As the inhabitants of Tipperary were actively engaged against the Protestants in 1641 and the succeeding years, great forfeitures took place on Cromwell's success, and many of the present landholders are descendants from his officers: Tipperary abounds with ruins. The number of old castles is very great, some of them boldly situated, and forming very striking objects to the traveller: such as the castle of Ardfinnan, built by king John, and that of Cahier, on an island in the Suir. The chief ecclesiastical ruins are those of Holycross, Monaincha, and Cashel, which all deserve to be visited by the curious. No statistical account has been published of the county of Tipperary, and there appear to be very scanty materials for its history.

TIPPERARY, a market and post-town in the county of the same name, 87 miles S.W. from Dublin, and about 20 miles N.W. from Clonmell, on the road to Limerick. Its name is said to be in Irish *Tiobrad-arain*, signifying the *well* of the territory called *Arain*. The town is not large, and appears to be in a ruinous condition, though it was formerly of sufficient importance to give its name to the county. The adjoining county is very rich, and there are some fine seats, especially Thomastown, the splendid seat of the earl of Llandaff, descended from the Mr. Matthew whom Swift visited; and Damers-Court, a seat of the earl of Dorchester. In the neighbourhood are the ruins of Emly, the church of which was once the metropolitan church of Munster, and which still gives name to a bishopric, united to the archiepiscopal see of Cashel.

TIPRA. See **TIPERA**.

TIPREE, a dry measure at Bombay; where the candy contains 8 parahs, the parah 16 adowlies, 64 fers, or 128 tiprees. Rice is sold by the batty measure, in which the morah is = 4 candies, or 25 parahs, the parah 20 adowlies, 150 fers, or 300 tiprees. A candy is = 25 Winchester bushels nearly.

TIPSA, in *Geography*, a town of Algiers, in the province of Constantina, on the borders of Tunis, near the banks of the Melage, anciently called *Tipasa*; at present a frontier city and garrison of the Algerines. This place, which enjoys a fine situation, with some mountains at a small distance, still preserves the principal gate, several fragments of old walls, and other marks of the rank and figure it formerly obtained amongst the cities of Numidia; 85 miles S.E. of Constantina. N. lat. 35° 27'. E. long. 8°.

TIPSTAVES, officers appointed by the marshal of the king's bench, to attend the judges with a rod or staff tipped with silver, and take charge of such persons as are either committed, or turned over at the judge's chambers.

The denomination is also sometimes given to those more frequently called *bossons*; who are the wardens of the Fleet's officers, attending the king's court with a painted staff, for the taking into custody such prisoners as are committed by

the court; and to attend such prisoners as go at large by licence.

TIPUL, in *Natural History*, a name given by the people of the Philippine islands, to a species of crane common there, and so tall, that when it stands erect, it can look over a man's head. See **DONGON**.

TIPULA, in *Entomology*, a genus of the Diptera order of insects, the characters of which are, that the mouth has a very short proboscis, membranaceous, canalculated on the back, receiving a bristle; the haustellum short, without a vagina; the feelers two, incurved, equal, filiform, longer than the head: the antennæ are mostly filiform.

The smaller species of this genus so much resemble gnats, that the generality of authors, not excepting even Goedart and Swammerdam, have confounded the two genera, and described these among the gnats.

The long form of the body, the position of the wings, and the length and position of the legs, are the circumstances that make the resemblance between the gnats and tipulæ; but the structure and organs of the head are alone a very sufficient distinction.

As the tipulæ differ from the gnats in the figure of the mouth, and in being without a trunk, they differ as much from the other flies of that character, by their resembling the gnat in the shape of their body. They differ also in the conformation of the mouth, and its several parts and organs. The opening of the mouth is a slit extending itself from the fore part of the head toward the hinder part, and its lips cannot be called upper and lower; but they are lateral ones. When the body of the creature is pressed, this mouth opens, and shews what seem to be a second pair of lips within. These are more firmly closed than the others, and resemble only certain duplications of the flesh. The exterior lips are cartilaginous, and are furnished with short hairs; the interior are perfectly smooth, and of a fleshy texture. The head of the tipula is of a long and slender figure; the lips are articulated at the extremity of this head, and on each side there stands, on the upper part, a sort of beard, which, when minutely examined, is found to be articulated in the manner of the antennæ of insects. These two beards, in their usual position, are placed close together, and bent forwards over the head; their office seems to be the covering of the aperture of the mouth. These seem constantly to be found in all species of the tipulæ, and placed exactly in the same manner.

The largest species of tipulæ are usually found in our meadows, and these are in no danger of being confounded with the gnat kind, their size alone being a sufficient obvious distinction. These are often found of nearly an inch in length from head to tail; but their bodies are very slender, and are composed of only nine rings. The male tipula is easily distinguished, at sight, from the female; it is much shorter in the body, and is thicker at the tail than any where else; this tail also usually turns upwards, whereas that of the female is placed in the same line with the body, and is slender, and composed of several scaly parts, proceeding from the last ring of the body. These creatures are found in our meadows through the whole summer; but the end of September and beginning of October is the time when they are most of all plentiful.

The legs of these creatures are greatly disproportioned to the body, according to the common rules of nature, especially the hinder pair, which are in the larger species usually three times the length of the body.

This large species is a creature of no great beauty; its body is of a brownish colour, and its corcelet is so elevated, that the creature seems hump-backed; the head is small, and

TIPULA.

the neck very short; the reticulated eyes are so large, that they cover almost the whole surface of the head; these are of a greenish colour, with a cast of purple, when viewed in some lights. Reaumur supposes that two very lucid specks, on the anterior part of the breast, are eyes, though placed in so very singular a manner; the wings of this creature are long, but very narrow, and seem scarcely well proportioned to the size of the animal; they are transparent, but have a slight cast of brown; and their ribs, when viewed by the microscope, appear beset with scales, or feathers, in the manner of those of the gnat kind. Some species of the tipulæ have them also fringed with these scales at the edges; there are no alerons, or petty wings, at the origin of these, but in the place of them there are two very fine balancers or mallets; these have long pedicles, and roundish or oval heads; the stigmata of the corcelet are four; one pair is placed immediately underneath these balancers, and the other immediately below the first pair of legs; the first pair is very long, the others small, and those on the rings of the body, if there be any, are too small for our sight, even with good glasses. Each ring of the body is composed of two half cylinders, which are joined into one, by means of a membrane, which gives them room to distend or close up at the creature's pleasure. The large tipulæ all carry two antennæ, or horns, upon their heads; but these are of no remarkable structure, they are only composed of a great number of joints, each covered with a fine downy hairiness; and at the joining of each to the next, there is a tuft of longer and more stiff hairs. This is the description of the common large tipulæ which we find in the meadows, and in almost all its parts is applicable to the generality of the larger species of these insects.

The smaller kinds are very numerous, and of great variety. These are frequent in all places, and at all seasons of the year; the spring shews us immense clouds of them, and even the coldest winter's day shews a great number of them in the sun-shine about noon. These creatures fly much better than the larger tipulæ; they seem indeed to be almost continually upon the wing, and their manner of flight is very singular; they are continually mounting and descending again, and that without quitting the direction of the line in which they go forward; this they will often do for many hours together. In tracing these flies from their origin, they are all found to be produced from worms which have no legs, and have a regular scaly head. Those from which the larger tipulæ are produced live under ground; they are most fond of marshy places, but any ground will do that is not often disturbed. They usually are found at about an inch under the surface, and are so plentiful in some places as greatly to injure the herbage.

These creatures do not find it necessary to their living, that plants should be upon the surface of the earth in which they live. There is frequently found in the hollows of the stumps of old trees, a sort of earth which seldom produces any vegetables; yet the female flies of this species well know that their young will find a proper subsistence there; and there are usually found great numbers of them in all these places. The hollow elms and willows, so common in our hedges, and by ditch sides, afford innumerable proofs of this; but it must be observed, that they are only found in such earth of this kind as is continually somewhat moist.

M. Reaumur mentions a very singular species of large tipulæ, which was produced with him from one of the worms found in the earth of an old elm; this was of the larger kind, and had some beautiful spots on the wings. It had also a very elegant tufted antenna; whereas, in the common large tipulæ, these are plain and simply granulated

ones, as well in the males as females. Reaumur's Hist. Inf. vol. ix. p. 7, &c.

The numerous species are distributed, by Gmelin, into several classes, as follow:

* With patent Wings.

PECTINICORNIS. With pectinated antennæ; the wings with a black spot; the thorax yellowish. Found in moist places in Europe.

RIVOSA. With hyaline wings; rivules brown, with a snowy spot. Frequent in Europe.

SINUATA. With white wings, sinuated margin and spots brown; cinereous body, and ferruginous feet. Found in the north of Europe.

QUADRIMACULATA. With wings brown-veiny, margin and four spots brown; abdomen above yellowish. There is a variety denominated *calmariensis*. Found in the meadows of Europe.

CROCATA. With wings having a brown spot; abdomen black, yellow bands. Frequent in the north of Europe.

OLERACEA. With hyaline wings; the margin of the rib brown. Found in Europe at the roots of pot-herbs, grain, &c. &c.

HORTORUM. With hyaline wings; scattered obsolete spots. Found among the pot-herb plants of Europe.

TRICOLOR. With whitish wings; the exterior margin and bifid apex brown. Found in North America.

TRIANGULARIS. With wings dimidiate-brown, and white triangular spot. Found in Scotland.

VARIEGATA. Black; base and sides of the abdomen red, spotted with yellow. Found in the gardens of Europe.

CONTAMINATA. Black, with white wings; two bands, and a point black. Found in moist places of Europe.

LUNATA. With ash-coloured wings, and white marginal lunule. Found in the meadows of Europe.

TURCICA. With veiny wings; white marginal lunule; cinereous body, and abdomen with a black dorsal line.

PRATENSIS. With variegated thorax; brown abdomen; sides spotted with yellow; front tawny. Found in the meadows of Europe, destroying the roots of grasses.

DORSALIS. Yellowish; brown back; hyaline wings; marginal spot black. Found in Germany and Italy.

PLUMBEA. Brown-cinereous, with white wings; rib and nerves black. An Italian insect.

TERRESTRIS. With hyaline wings; brown marginal point; back of the abdomen cinereous. Found in Europe. See *CRANE-FLY*.

CORNICINA. With hyaline wings, marginal point brown; abdomen yellow; three lines brown. Found in Europe at the roots of plants.

NIGRA. With brown wings, and black body. Found among the plants of Europe.

ALBIMANA. Black, with testaceous thighs, and hinder tarsi white.

COSTALIS. Sordidly yellow; with antennæ twice longer than the body; hyaline wings, and brownish costa. Found in Van Diemen's Land.

CLAVIPES. Brown; with tarsi annulated with white in the middle; ovated, inflated. Found in North America.

ATRATA. With glaucous wings; marginal point and body black; first segment of the abdomen and feet red. An European insect.

BIMACULATA. With hyaline wings; two brown spots; the middle of the abdomen spotted ferruginous; plumose antennæ; as the former.

ANNULATA.

TIPULA.

ANNULATA. With wings variegated with brown; thighs with white rings; as the former.

OCELLARIS. With whitish wings, very numerous, blackish, ocellar spots. North of Europe.

CINEREA. With whitish wings, three brown spots, cinereous unspotted body. A Norwegian insect.

FASCIATA. With whitish wings, four brown flexuose bands; abdomen and feet yellowish. Found in the marshes of Sweden.

MELANOCEPHALA. Testaceous; head and dorsal line of the thorax black; wings hyaline; three brown streaks. A Cayenne insect.

SEXPUNCTATA. With white wings; three marginal brown points; thorax compressed, yellow; dorsal line black. Found in Italy.

FLAVIPES. Brown, with obscure wings spotted cinereous, and three brown costal spots; feet yellowish; joints brown.

TRIPUNCTATA. With hyaline wings; three marginal points brown; yellow body. Found in Italy.

FLAVESCENS. With unspotted wings; yellow body; brown back. Found in the fields of Europe.

ENSIFORMIS. With lanceolate serrulate antennæ; wings, veins, and spot black. Found in Sweden.

REGELATIONIS. With hyaline glossy wings; cinereous brown body. Found frequently in Europe.

PILIPES. Cinereous; with striated brownish wings; foremost legs hairy.

MORIO. Black; with white wings; marginal point brown; pallid feet.

REPLICATA. With hyaline wings; margin slender, recurved; body brown; simple antennæ. Found in the waters of the north of Europe.

MONOPTERA. Black; with feet and feelers pallid. North of Europe.

ARUNDINETI. Whitish; villose antennæ; black eyes. Found among the reeds of Europe.

BARBICORNIS. Black; with plumose antennæ; simple at the apex. Found occasionally in Europe.

GIGANTEA. With wings brown, hyaline, waved longitudinally in the middle. Found in the gardens of Austria and France.

VENOSA. With hyaline wings; veins brown, and brown margin. In Upper Austria.

PPLICATA. Cinereous; with hyaline wings; brown veins; external margin and middle line interwoven in small folds. Upper Austria.

PUNCTATA. With hyaline wings, pointed with black; exterior margin spotted with black. As the former.

PHRAGONITIDIS. Yellow; with black head, hyaline wings, and three black points. Found among the reeds in Austria.

LINEATA. Yellow; pointed with three lines on the thorax, and four on the abdomen. Austria and Carniola.

OCREATA. Black; with hyaline wings, spotted and pointed with black; the band before the hinder tarsi white. Upper Austria.

BIFASCIATA. Yellow; with hyaline wings, subfasciated with brown. Upper Austria.

DEPRESSA. With cinereous thorax; abdomen yellow, depressed; wings yellowish-brown; four marginal spots brown. An European insect.

DISCOLOR. Cinereous; abdomen on both sides yellowish; wings with brown and white spot. As the former.

PECTINATA. Black; with antennæ semi-pectinated; glaucous wings; marginal point and apex large; thighs and legs red; apices black. As before.

VERSICOLOR. Yellow; thorax yellow, spotted with black; abdomen and back, beneath and sides, cinereous; wings, veins, and spot brown. As before.

MACULOSA. Black; bill, legs, and apex of abdomen yellowish; wings with scattered brown spots. As before.

LUTEA. Pale yellow; with yellowish wings. As before.

FUSCIPES. Black; with two yellowish bands on the abdomen; white wings, spotted with black; yellowish legs, joints, and soles; with the toes brown. As before.

QUADRIFASCIATA. Cinereous-yellowish; with grey wings; four yellowish bands, and margin of costa pointed; with yellow legs; black joints. As before.

OCTOPUNCTATA. With white wings; eight black points; black abdomen; thorax and legs palish. Found at Paris.

PARISIENSIS. Green; with hyaline wings; brown band; the two bands of the abdomen and anus black. As before.

SECALIS. Cinereous; with ciliated wings; eyes, antennæ annulated with white; the apex of the abdomen and feet black. Found in fields of rye. Gmelin queries whether the two last species belong to this tribe of insects.

* *With incumbent Wings*: "Culiciform."

PLUMOSA. With greenish thorax; white wings; brown point; and plumose antennæ. In the marshes of Europe.

LITTORALIS. Greenish; with unspotted wings; and fore-legs very long. In the maritime parts of Europe.

CINCTA. Livid; with wings and three marginal spots black; the abdomen black, annulated with white. Found in Sweden.

MOTITATRIX. With fore-legs very large and motatory; with white ring. Frequent in Europe, yellow-green.

PILICORNIS. Blackish; fore-legs as before; thorax lined; white wings unspotted.

FASCICULATA. Black; fore-legs as before; sides of the abdomen spotted with ferruginous. Found in Germany.

TENDENS. Ferruginous; with white unspotted wings; fore-legs very long and pale. In marshes of Denmark.

VIBRATORIA. Fore-legs very large, motatory; white at the apex. Found in marshes of Europe.

VARIA. Brown; fore-legs elongated; abdomen yellowish; wings varied with white and black.

TREMULA. Fore-legs very long, motatory; black, with white wings. In the marshes of Sweden.

FLEXILIS. Fore-legs motatory, all pallid; wings with duskyish band. In the watery places of Europe.

MONILIS. With white legs, nine black rings; wings varied with white and cinereous. In the gardens of Europe.

ZONATA. Pallid; with wings, two bands, and three points brown; thighs with brown angle. Found in Orford.

VIRENS. Green; with unspotted wings; brown soles. A Swedish insect.

VIRIDULA. Green; with antennæ verticillate, hairy; pallid legs. North of Europe.

GENICULATA. Beneath yellowish; lines of the thorax and back of the abdomen black, with white immaculate wings.

PALLIPES. Smooth-brown; with hyaline unspotted wings, and palish legs.

MACROCEPHALA. Greenish; with eyes and back of the thorax black. In the marshes and moist shores of Europe.

PUSILLA. Green; with three black spots on the hinder

part of the thorax; antennæ of the male plumose. In the lakes of Europe.

MARCI. Black, smooth; with blackish wings; fore-thighs furrowed inwards. In the dunghills and putrescent soil of Europe: probably a variety of *hortulana*?

THOMÆ. Black, smooth; with black wings; sides of the abdomen marked with a saffron line. At Upsal.

CHRYSANTHEMI. Black, smooth; the abdomen red at the base; the antennæ incrassated, pilose. On the *chrysanthemus coronarius* of Spain.

FERRUGINATA. Black, smooth; brown wings; abdomen brown-ferruginous. South of Europe.

JOHANNIS. Black, smooth; white wings; black point; short antennæ; black legs. In shady parts of Europe.

POMONÆ. Black, smooth; hyaline wings; black point; ferruginous thighs. In the plains of England and Norway.

RUFICOLLIS. Black, smooth; red thorax. At the Cape of Good Hope.

BREVICORNIS. Black, smooth; with wings blackish at the margin; abdomen brown; fore-thanks spinose. In the shady gardens of Europe.

PUTRIS. Brown; the base of the wings cinereous. In the teeming soil at the commencement of spring.

FEBRILIS. Black, oblong, hairy; with blackish wings. An European insect in close places.

INSULARIS. Black, hairy; with ferruginous legs, hinder elongated.

FORCIPATA. With cylindric black abdomen; wings brown-hyaline; anus appendiculated. An English insect.

VERNANS. Cinereous; thorax black-lineated; white wings spotted with brown. In meadows of Denmark.

FLORILEGA. Black, filken. On the apple-flowers of Europe, which it destroys.

HORTULANA. With hyaline wings; exterior margin black. In the flowers of asparagus and apple.

PHALENOIDES. With wings deflexed, cinereous, ovate-lanceolated, ciliated. In the walls of dunghills and mixens of Europe.

HIRTA. Hairy; with wings deflexed, ovate-ciliated, tessellated with white and black. In Lapland.

PERSICARIÆ. Black; with wings incumbent, subciliated; under the leaves of the peach-tree.

NOTATA. Black; with white wings; with a white spot in front of the sides of the abdomen. In Europe.

JUNIPERINA. Cinereous; with white wings; margin villous; found in the juniper.

CULICIFORMIS. Cinereous, with pallid legs; wings marked with two blackish spots. At Upsal.

INCARNATA. Incarnated; with moderate antennæ. At Upsal.

PALUSTRIS. Pallid; black head; reddish abdomen. In marshes of Europe.

LONGICORNIS. With antennæ longer than the incarnated body. In moist places of Europe.

RUFIPES. Black; with red legs; wings black in the middle; yellowish at the base. North of Europe.

STICTICA. Black; segments of the abdomen white at the apex; wings with a brown point. In Germany.

PALLIDA. Pallid, pilose; legs punctated with black. In Germany.

HAFFNIENSIS. Brown; lateral line of the thorax and legs whitish, unspotted.

FLABELLICORNIS. Pallid; abdomen annulated with black; wings spotted. Germany.

BIPUNCTATA. Brown; wings cinereous; marginal point white. Found in Europe.

SERICEA. Black; back black; sides of the thorax bare; balancers yellow. In Sweden.

MINUTISSIMA. Yellow; eyes concurring in the vertex black. In the ditches of Sweden and Austria.

PULICARIS. Black; sides of the thorax, scutellum, and abdomen yellow. In the ditches of Europe.

PENNICORNIS. With antennæ bipectinate; black body; halteres, or balancers, white. In the flowers of *aristolochia clematis*.

SCATHOPSE. Black; antennæ moniliform; with wings incumbent hyaline. In the privies of Austria.

BUXI. Yellow; head and thorax black; wings brown incumbent. In the box-tree of Europe.

BERBERINA. With wings incumbent, fuliginous; spotted white at the base and margin. In the excrescences of the barbery.

LUTESCENS. Yellowish; three brown spots on the back; antennæ plumose. Found in Europe.

TRIFASCIATA. Ferruginous; with three bands on the wings. In Europe.

MULTICOLOR. Yellowish body; greenish abdomen; white wings with a brown band. As before.

ALBA. Grey; with white wings and abdomen; the apex of the latter brown. As before.

CARBONARIA. Black; legs ferruginous; wings hyaline. As before.

PLUMICORNIS. Brown; antennæ brownish-plumose; legs yellowish. As before.

DICHROA. Black; legs ferruginous. As before.

LEUCOPTERA. Brown; apex of abdomen and legs pale yellowish; wings white. As before.

MOSCHIFERA. Wings cinereous; thorax and abdomen yellow. Found in Chili.

TIPULA WASP. See *WASP Tipula*.

TIQUADRA, in *Ancient Geography*, one of the small islands situated near the Balearic islands, near the town of Palma.

TIQUINA, in *Geography*, a town of Peru, in the diocese of La Paz; 55 miles N.N.W. of La Paz.

TIR, a town of Persia, in the province of Khorassan; 40 miles N. of Herat.—Also, a town of Persia, in the province of Farsistan; 50 miles N.E. of Schiras.

TIRABOSCHI, GIROLAMO, *Abate*, in *Biography*, author of the best history of Italian literature which that country, fertile in men of learning, taste, and talents, has produced. He was born at Bergamo in 1731, and is styled *Cavaliere* by his biographer, and the last editor of his History, in a life prefixed to the index of the second edition, published at Modena in 1794. He had his education in the Jesuits' college from fifteen till the abolition of the order. He was professor of eloquence in the university of Brera at Milan till the year 1770, when he was appointed præfect of the Este library at Modena, by the interest of count Firmian. He first distinguished himself, after this appointment, by a new edition of the Italian and Latin Vocabulary of Mandosio; which work was almost wholly new written by him, and corrected and augmented with the most refined purity of the two languages; and the Latin and Italian orations which he delivered publicly at Milan, two of which were printed, and established his reputation for eloquence.

He distinguished himself during the first years of his præfectorship of the duke of Modena's library, by drawing up a new catalogue of the manuscripts, books, medals, gems, and rarities of that celebrated library, and compiled the first volume of his History of Italian Literature, published in 1771, which manifested such taste and solid learning

learning as astonished his readers; but the public in general was still more astonished at his finishing the whole work in eleven years, consisting of thirteen large volumes in 4to.; a work which, by its immense erudition, profound critical discussions, and judgment in every kind of literature, acquired him the praise of the whole republic of letters.

Besides this great work, he produced during the same period the life of St. Olympia; a letter on the comparative excellence of Italian and Spanish literature; the life of Fulvio Testi; the two first volumes of the *Biblioteca Modenese*; and all the articles which he furnished to the twenty-three first volumes of the *Giornale di Modena*, a kind of review and history of new books and discoveries in arts and sciences within the year.

He was knighted by the duke of Modena, though a regular ecclesiastic, and ennobled by his fellow-citizens at Bergamo. To enable him to proceed in his great work with more convenience, his patron augmented his appointment, and gave him an assistant in the library.

His correspondence with the learned throughout Europe must have occupied much of his time: as at his decease, among his papers were found materials for twenty-eight volumes of original letters addressed to him as author of the *Literary History of Italy*, and editor of the *Giornale di Modena*. In his numerous minor productions, as well as in those of greater volume and importance, he discovers himself to have been gifted with a quick penetration, and possessed of great facility in writing, as well as a clear conception of the works of others, which to have acquired, must have been studied with constant application.

This admirable writer died at the age of sixty-two, of a bloody flux, in 1794.

From this celebrated work, we expected to acquire new and authentic information concerning the rise and progress of music previous to the seventeenth century, in a country which has taught every other part of Europe all the refinements of the art, a country in which we fought in vain, by travelling, conversation, and the perusal of all the books written by the natives which we could procure on the subject, to trace the origin of Italian melody. Dull and pedantic elementary books we procured in abundance; but scarcely any that we could read with pleasure, previous to the establishment of the opera at the beginning of the seventeenth century. Quadrio's heavy volumes are filled without taste, selection, or solicitude concerning the authenticity of facts. Padre Martini, unfortunately for modern musical history, did not live to finish his plan; having advanced no farther than the ancient music of the Greeks.

Tiraboschi is copious on all other parts of literature, arts, and sciences. It is only on music, and musical writers, our peculiar research, that we have ever found him unsatisfactory: we never consulted him on any other subject unprofitably. The little he tells us of Pythagoras, Aristoxenus, the Etruscans, and Guido, we had often previously read in innumerable books in various languages.

He speaks of the Lyric poetry of the Greeks and Romans; but that of the Italians has not furnished an article. We did hope to be informed what kind of melodies were set to the songs of Dante, Petrarca, and Boccaccio. We could not reasonably expect specimens of this melody in notation, any more than prints of pictures and buildings that are mentioned in his work; but when a capital work of Raphael, Michael Angelo, or Palladio is mentioned, we are generally told where it is to be seen, or at least where it has been seen. Had Tiraboschi told his readers where the original melodies to the songs of the old Italian poets

were to be found, it would have been a great satisfaction to those who consult books for useful and solid information, or seek in them for any thing but mere amusement.

Of the last century he says nothing, as his plan went no farther than the end of the seventeenth century. And, indeed, of that period, his information is very scanty; neither Carissimi nor Stradella, the two best composers which Italy had then produced; nor among contemporary theorists, or writers on harmonics, is any notice taken of Lemme Rossi, or Daniel Bartoli, authors of two books, which in a general history of literature ought to have been mentioned. See BARTOLI, and ROSSI.

TIRACHEA, in *Ancient Geography*, a town of Judea, in the Decapolis, on the coast of the sea of Galilee.

TIRADE, in *French Music*, formerly implied what the Greeks meant by *αγωνα*, *agogo*, *ductus*, the filling up a wide interval by the intermediate diatonic notes. (See GREEK *Music*.) But, at present, *tirade* seems nearly equivalent to *volata* in Italian; a division, a flight.

TIRAGHT, in *Geography*, an island in the Atlantic, near the W. coast of Ireland; 8 miles S.W. of Dunmore-Head.

TIRAMANGALUM, a town of Hindoostan, in Madura; 10 miles S.W. of Madura.

TIRAMANY-MUTOO, a river of Hindoostan, which runs into the Cauvery; 8 miles N. of Carroor.

TIRAN. See TYRAN.

TIRANADUM, or TIRINADUM, in *Ancient Geography*, a town of Africa, in Mauritania Cæsariana, on the route from Carthage to Cæsarea, between Rapidum and Caput-Cillanum. Anton. Itin.

TIRANDURG, in *Geography*, a town of Hindoostan, in Mysore; 12 miles S.S.E. of Ouffoor.

TIRANO, a town of Italy, in the department of the Lano, late belonging to the Grisons, the capital of the Upper Terzero, and residence of a governor called Podesta, on the Adda, which divides it into two parts, connected by a stone bridge of a single arch: formerly surrounded with walls by Ludovico Sforza, as a defence against the Grisons, who destroyed the fortifications when they gained possession of the Valteline. The chief trade is in wine and silk, which is not considerable. The wine is sent into the country of the Grisons, to Bormio, and into the territories of Venice; the silk, which is drawn from this district of the Valteline, is not of the best quality, nor very abundant; part is forwarded to Venice, and the remainder, through Chiavenna, to Germany. About half a mile from the town, on the other side of the Adda, is the church of the Madonna, or Virgin, much visited by Catholic pilgrims; the modern building annexed to what remains of the old edifice is in an elegant style of architecture, and the era of it is 1533, the ancient part having been erected in 1206. In the area before the church is held the fair of Tirano, remarkable for the number of cattle brought hither for sale; they are fed upon the highest Alps, where they continue until the snow begins to fall, and are chiefly sent from hence into Italy. The fair is in October, and lasts three days, during which time the authority of the podesta is suspended, and the governor of the Valteline has absolute jurisdiction over the town and the district; 24 miles E.N.E. of Morbegno.

TIRANY, a town of Hindoostan, in the Carnatic; 3 miles N. of Ootatore.

TIRATA, in old *Italian Music*, implied a regular ascent or descent of notes of the same kind; but, at present, the term has a more extensive acceptation than its original import, *drawn out*: as when a subject is well treated, productive

ductive of beautiful passages, made the most of by a composer; it is then said to be *ben tirato*.

TIRBIA, in *Geography*, a town of Spain, in Catalonia; 16 miles N.W. of Urgel.

TIRE, or, as the seamen pronounce it, *tier of guns*. See TIER.

TIREBOLI, in *Geography*, a river of Turkish Armenia, which runs into the Black sea at Tireboli.—Also, a town of Turkish Armenia, on the Black sea, at the mouth of a river of the same name; 20 miles N.E. of Kerefour.

TIREH, a town of Asiatic Turkey, in Natolia, situated on the Meinder; the inhabitants are chiefly Turks; 32 miles S.S.E. of Smyrna. N. lat. $38^{\circ} 8'$. E. long. $27^{\circ} 40'$.

TIRES of *Wheels*, in *Rural Economy*, the straps, slips, bands, or hoops of iron which are put round them for the purpose of guarding and protecting them against the effects of the roads, as well as securing and keeping them tight in their different parts. The most advantageous and beneficial form of tire for wheels of different kinds and breadths in different points of view, have probably not yet been well ascertained. It is obvious, however, that it should be such as may have the least possible tendency to penetrate and destroy the surfaces on which the wheels act and move. It would appear, that almost all of those who have written on this subject, have gone upon a wrong or false principle; nearly all having directed that the exterior surface, when more bands than one are used, as in the case of broad-wheeled waggons, should be unequal; in such a manner as that the centre band may receive the whole of the pressure, when the road is even and composed of hard materials; the other bands being only in readiness to sustain their portions of the burthen, when, either from unevenness or the want of firmness in it, they may be brought into contact with it.

It is well known, however, to every one, that it is the nature of a wedge to work its way, when forcibly applied to a cleft or opening; and that the extent of its penetration will depend on the sharpness or acuteness of its wedge-form, and the power by which it is impelled. Admitting this to be the fact, it is plain that every wheel, the tire of which acts in the smallest degree as a wedge, must enter a loose soil, surface, or road, more or less, in proportion as its edge or projection is more or less acute and protruding, or the contrary.

A rolling cylinder is not easily capable of penetrating below the surface, for this reason, that it presents no *one protruding* point; but where a rolling body swells out in a projecting manner in the middle, it will unquestionably act or work deeper in that part where it is the most prominent, than in any other, as it is a sort of obtuse wedge. And such must be the case in every wheel of which the tire is not cylindrical; as when its protruding part gets in, the whole body soon finds its way.

A broad flat tire is not, however, without its inconvenience; as, whether the road be good or bad, it presents the same surface, and, of course, is as much resisted in its front, while on a hard surface, as while on one into which it sinks. Consequently, the cylindrical tire can never draw light and free, though it will not by any means penetrate deeply into any tolerably sound surface.

Flat tires are probably, however, the best of any for narrow wheels.

In consequence of the above, it has been proposed by some, that every wheel should be furnished with a *concave* or hollow tire which is cylindrical; but, that after leaving two rims, of proportionate breadth, at the edges, the whole

intermediate space should be scooped out, or otherwise hollowed. By this means, on hard roads, the wheel would ride on the two rims only: while on soft roads, the whole would bear up the burthen. All such wheels, the tires of which have even the smallest tendency to a wedge-like form, invariably, it is said, throw the soil or earth from them; squeezing it out at the sides, and burying themselves, not only in the furrows they make, but under the very mud which they force from out of them: while, on the contrary, the concave tire, it is supposed, keeps in the soft soil, unless, indeed, it be in an absolutely sloppy state, and forces it, by compression, to bear up the weight or burthen. It is observed, that let two wheels be tried on a meadow which is not very firm in its surface, the cylindrical tired wheel will, assuredly, act better than that with a receding or convex edged sort of tire; but that the concave tired wheel could not, it is believed, fail to display its superiority in several of the most desirable points and respects.

Let it be supposed that the tire of a waggon-wheel is nine inches in breadth, and cylindrical: at the two edges leave a band of one inch in breadth, or more; then groove out the intermediate space, to an inch and a half in depth in the centre, rounding it in gradually. Such a tired wheel would, it is said, on a hard road, present only two inches of bearing; while the resistance would gradually increase in proportion as the incumbent weight, and the softness of the surface over which it may be proceeding, should bring the whole to bear in an equal manner. The soft soil could not escape so easily, at least, it is conceived, from under a concave tire, as those of the opposite kind, consequently it could not add to the exterior impediments of wheels.

It must nevertheless be admitted, it is said, that the concave tire is liable to some disadvantage; for instance, it will at times clog, and, possibly, not only choke its own groove, but even accumulate considerably more; which will adhere to the clay and other matters with which the groove may be filled. In this way, it would, in fact, it is thought, become, in a certain measure, cylindrical. But that if it did no more than fill its groove on heavy soils, it would not prove so highly objectionable; for, on such, the whole breadth of the tire *ought* to press the soil or surface.

The remedy suggested for the above inconvenience, in such cases, is that of a suitable fixed scraper, which has no difficulty in it, at least, for carriages on one pair of wheels, or for the hind wheels of waggons. Such a scraper, and the mode of fixing it in such cases, may be seen described in speaking of scrapers for different kinds of implements, tools, &c.

These hints and suggestions may be useful in leading to farther improvements on the tires of wheels, which is a matter of great importance in different points of view, and which, as has been seen, has yet been thought but little upon in a proper manner. See WHEEL.

TIREYMEG LAKE, in *Geography*, a lake of North America. N. lat. $61^{\circ} 52'$. W. long. 107° .

TIRGUBIS, or TIGUBI, in *Ancient Geography*, a town of Asia, in Mesopotamia, on the banks of the river Chaboras, according to the Theodosian table and Ptolemy; situated N.W. of Resaina.

TIRGUL, in *Geography*, a town of European Turkey, in Moldavia; 62 miles W. of Jassy.

TIRGULFORMOSA, a town of European Turkey, in Moldavia; 20 miles W. of Jassy.

TIRING;

TIRING, in *Falconry*, is the giving a hawk the leg or pinion of a fowl to pluck at. *Dict. Rust.*

TIRIPANGADA, in *Ancient Geography*, a town of India, on this side of the Ganges. *Ptol.*

TIRIPIN, in *Geography*, a sea-port of South America, in the province of Cumana.

TIRISTA, in *Ancient Geography*, a town of Lower Myfia, near the Danube, between Trimanium and Durustorum. *Ptol.*

TIRISTRIA, or **TETRISIA**, a promontory of Lower Myfia, on the Euxine sea, between Dionysopolis and Odeffus. *Ptol.*

TIRKA, in *Geography*, a town of Africa, in the kingdom of Ghana, on the north side of the Niger; 120 miles E. of Ghana. N. lat. 15° 20'. E. long. 14° 30'.

TIRLEMONT, a town of France, in the department of the Dyle, called by the people of the country *Tienen*; on the Geete. It was anciently one of the principal cities of Brabant, and made a fourth quarter in the assembly of the States; but that precedence was afterwards removed to Bois-le-Duc. It certainly has been a very flourishing and populous city, and many vestiges of its grandeur are yet visible; but it has suffered much by war, and other calamities; 9 miles S.E. of Louvaine.

TIRMAKUL, a fort of Hindoostan, near Gooty, taken by the British in 1801.

TIRMANIZ, a mountain extending from Bukovina to Transylvania.

TIRNA, a river of Hungary, which runs into the Danube, a few miles below Presburg.

TIRNAU, a town of Hungary, containing nine churches, and as many convents. This town was built in the thirteenth century; 20 miles E.N.E. of Presburg. N. lat. 48° 24'. E. long. 17° 44'.

TIROAN. See **TARON**.

TIROCOOR, a town of Hindoostan, in Golconda; 8 miles S. of Caloor.

TIRRETÓ, a town of Naples, in Calabria Ultra; 15 miles E.S.E. of Reggio.

TIRROUP-MEW, a town of the Birman empire: the meaning of the word is the *Chinese city*, and the appellation was derived from a victory obtained over the Chinese some centuries ago, when they invaded Birmah; 35 miles N.E. of Pagan.

TIRSÆ, in *Ancient Geography*, a town of Macedonia, in Mygdonia.

TIRSCHENRIED, in *Geography*, a town of Bavaria; 28 miles N.N.E. of Amberg.

TIRSCHNITZ, a town of Bohemia, in the circle of Kaurzim; 4 miles N.W. of Kosteletz.

TIRSIO, in *Ichthyology*, a name given by Gaza and some other authors to the phocæna of Willughby and others, the *porpesse* or *marfum*. Pliny, Bellonius, and many others call it *tursio*.

TIRSNUM, in *Geography*, a town of Sweden, in East Gothland; 25 miles S. of Linkioping.

TIRUA, a small island in the Pacific ocean, near the coast of Chili. N. lat. 38° 30'.

TIRUAN, a town of Hindoostan, in Bundelcund; 20 miles N.E. of Callinger.

TIRUMBORE, a town of Hindoostan, in Madura; 7 miles N.E. of Madura.

TIRUN, or **TEDONG**, a name given to tribes who live chiefly on the N.E. coast of Borneo, and are reckoned a savage and piratical race, addicted to eating the flesh of their enemies. Their language is peculiar. It is probable,

however, that they are only a tribe of Idan, who are imagined to be only a race of Haraforas or Alfoërs, as they are termed by the Dutch, who seem to be the most original race of all the eastern islands, excepting perhaps the Papuas. The Idan are sometimes termed Marut; they are certainly the original inhabitants of Borneo, and resemble the Haraforas equally in stature, agility, colour, and manners. The Haraforas are indigenous in almost all the eastern isles, and are sometimes found on the same island with the Papuas or oriental negroes. They are often lighter in colour than the Mahometan races, and generally excel them in strength and activity. They are universally rude and unlettered, and where they have not been reduced to the state of slaves of the foil, their manners have a general resemblance. In their manners, the most singular feature is the necessity imposed on every person, of some time in his life embruing his hands in human blood; and, in general, among all their tribes, as well as the Idan, no person is permitted to marry, till he can shew the skull of a man whom he has slaughtered. They eat the flesh of their enemies, like the Battas, and drink out of their skulls; and the ornaments of their houses are human skulls and teeth, which are consequently in great request among them, as formerly in Sumatra, the ancient inhabitants of which are said to have originally had no other money than the skulls of their enemies. The Haraforas are found in all the Moluccas, in Celebes, the Philippines, and Magindano, where they are termed Subano or Manubo; and the ferocious race mentioned by Marfden, who live inland from Samanka in Sumatra, and are accustomed to atone their own faults by offering the heads of strangers to the chiefs of their villages, are probably of the same description. *Af. Ref. vol. x.*

TIRUVELORE, a town of Hindoostan, in the Carnatic; 30 miles E. of Tanjore.

TIR-Y, or **TYRIE**, one of the islands of the Hebrides, situated in the district of Mull, and shire of Argyle, Scotland, is about 11 miles in length, and 2½ miles in breadth. Its coast is mostly rocky, and intersected with many beautiful sandy bays, some of them a mile broad. About one-half of the surface is arable, interspersed with small rocks and rising grounds, none of which are above 250 feet above the sea-level; but the surface in general is so even, that the waves are often seen from the one shore rising apparently several feet above the level of the other. In the centre of the island is a large plain, which contains about 1200 Scotch acres, and is elevated about six feet only above high-water mark; consequently, in stormy weather the sea often meets across this plain, and is productive of bad consequences. The inhabitants have endeavoured to avert this evil by building a defence of stone and earth on the one side, while the sea, on the other, has raised a considerable barrier of boulder stones; yet neither has been sufficient to resist the waves of the Atlantic. Here are several lakes, covering in all about 600 acres: in one of these is a small island, on which are the ruins of an ancient castle, on the site whereof a neat house has been erected for the residence of the factor of the duke of Argyle, who is proprietor of the whole island. The fisheries employ a number of hands, as well as the manufacture of kelp, of which about 245 tons are annually made. The hill of Cean-Mharra, the western point of the island, is remarkable for a great number of large natural caves, frequented by innumerable flocks of sea-fowls. Here are the remains of many Danish forts, and also of several old chapels, at some of which burying-grounds and crosses are still visible. In the time of St. Columba, this appears to have been part of the patrimony of

of that church. Here is a parochial school, and also one established by the Society for Promoting Christian Knowledge, both of which are well attended. The population of the parish (which comprehends the islands of Coll, Gunna, and Tir-y) was, in the year 1811, estimated at 3186. There is a regular ferry from Tir-y to Coll, three miles distant, which is often dangerous, owing to a heavy swell from the Atlantic, and a rapid current over rocks and shifting sands. The two islands appear to have been formerly united: the isle of Gunna, which lies in the sound, being apparently part of the intermediate land which has escaped destruction.—*Beauties of Scotland*, vol. v. *Carliſle's Topographical Dictionary of Scotland*, vol. ii.

TIRYNS, in *Ancient Geography*, a town of the Argolide, N. of Midea, situated in an enclosure of the mountains; called anciently Halicis, or the town of fishermen, from its having been the abode of the Hermionean fishermen. In the time of Paulanias it was in ruins.

TISEUS, or **TISEUM**, a very lofty mountain of Theſſaly.

TISALPHATA, a town of Mesopotamia, situated W. of the Tigris, on one of the small rivers which discharged themselves into the Mygdonius.

TISBURY, in *Geography*, a small fishing town on the N. coast of Martha's Vineyard, belonging to the state of Massachusetts.

TISCHNOWITZ, a town of Moravia, in the circle of Brunn; 13 miles N.W. of Brunn.

TISDRA, **TUSDRO**, or *Thyſdrus*, in *Ancient Geography*, a town of Africa, six leagues S.W. of Sarfura and five leagues S.W. of Achola. It has many ancient relics of altars, inscriptions, columns, and fragments of marble statues; and also the remains of an amphitheatre.

TISEBARICA, a country of Ethiopia, according to Arrian, which commenced near the port of Berenice, and extended along the Red sea, as far as the country of the Moschophagi.

TISHEET, in *Geography*, a town of Africa, with a salt-mine; 150 miles N. of Benown. N. lat. 17° 20'. W. long. 26° 50'.

TISHOLTZ, a town of Hungary; 10 miles E.N.E. of Libeten.

TISIDIUM, in *Ancient Geography*, a town of Africa, the command of which, according to Sallust, was given by Metellus to Jugurtha.

TISIPHONE, in *Mythology*, one of the three Furies. She is represented by the poets with vipers, sometimes as loose serpents, intermixed with her hair, and sometimes as serpents growing from her head instead of hair. As she is one of the chief of all the infernal executioners, her robe is described either as dropping with fresh blood, or stiff with human gore: this robe is fastened round her with a serpent instead of a girdle; and she has sometimes vipers twined round her arms instead of bracelets. They sometimes give her a torch in her hand wet with blood; sometimes a torch in one hand and a serpent in the other; and sometimes serpents in both. Statius, *Theb.* i. v. 91. v. 111. v. 113. *Theb.* vii. v. 467. Ovid. *Met.* iv. v. 483. v. 490. v. 495. v. 510.

TISMANA, in *Geography*, a town of Walachia, at the source of a river of the same name; 18 miles W. of Tergosyl.—Also, a river of Walachia, which runs into the Syl, 15 miles S. of Tergosyl.

TISQUIU LAKE, a lake of North America. N. lat. 56° 10'. W. long. 95° 45'.

TISRI, or **TIZRI**, in *Chronology*, the first Hebrew

month of the civil year, and the seventh of the ecclesiastical or sacred year.

The Hebrews call it *raſſ-baſſanna*, that is, the beginning of the year. It answered to part of our September and October. On the first day of this month was kept the feast of trumpets, because the beginning of the year was then proclaimed by found of trumpets. On this day they refrained from all sorts of servile business, and offered in sacrifice a calf, a ram, and seven lambs. *Levit.* xxiii. 24. *Numb.* xxix. 1.

The tenth day of this month was the great day of expiation, and on the fifteenth the feast of Tabernacles began, which lasted till the twenty-second day inclusively. See *SCENOPEGIA*.

TISSA, in *Ancient Geography*, a small town of Sicily, at the northern foot of Ætna, near the river Onobala. *Ptol.*

TISSANAH, in *Geography*, a town of Hindooſtan, in the circar of Sumbul; 16 miles S.W. of Sumbul.

TISSIA, a town of Bengal; 35 miles S.E. of Palamow.

TISSUE, **CELLULAR**, in *Anatomy*, the cellular substance. It is an expression borrowed from the *tiffu cellulaire* of the French, who also often call it *tiffu muqueux*. See *CELLULAR Substance*.

TISTE, in *Geography*, a post-town of Germany, in the county of Verden; 20 miles N.E. of Rotenburg.

TISURUS, **TOZER**, in *Ancient Geography*, a town of Africa Propria, S. of Adrametum, and 4 leagues S.W. of Tichafa. It has some Roman remains.

TIT, in *Geography*, a town of Morocco, near the Atlantic ocean; 8 miles S.W. of Mazagan.

Tit, in *Rural Economy*, a term provincially applied to a small stiff horse, or sort of poney, and sometimes to other horses, as a handsome or ugly tit, &c.

TITALBARY, in *Geography*, a town of Bengal; 20 miles N.N.W. of Goragot.

TITALEEA, a town of Bengal; 6 miles E. of Moorshedabad.

TITALLYA, a town of Bengal; 50 miles N. of Dinagepour.

TITAN. See *LEVANT*.

TITANA, in *Ancient Geography*, a town of Sicyonia, E. of the river Sitas, and W. of the river Afopus; situated on a mountain, and regarded as a fortified town. Here was a temple of Esculapius, and a statue of this god; and also a statue of Hygeia. In the temple of Esculapius were nourished sacred serpents.—Also, a small country of Sicyonia.—Also, a river of Asia, which had its source in mount Zagrus, and flowed into the river Sillas.

TITANIA, *titania*, in *Antiquity*, a festival in memory of the Titans.

TITANIDÆ, or **ARTEMIDÆ**, the seven daughters of Chronus, son of Uranus, by Aſtarte.

TITANIS, in *Ancient Geography*, a port on the western coast of Corſica, between the mouth of the river Ticarius and the town of Fiſera. *Ptol.*

TITANIUM, in *Mineralogy*, a metal originally discovered by Mr. Gregor of Cornwall, in the grains of a black mineral found in the bed of a rivulet in the valley of Menaian, in that county. It occurs also in different states of oxydation or intermixture in various parts of the world; and, according to the recent observations of M. Cordier, is a constituent part of most volcanic rocks. The oxyd of titanium is reduced by exposure to an intense heat, being previously moistened with oil and surrounded by powdered charcoal.

TITANIUM.

charcoal. A blackish blistered substance is obtained, which has a reddish colour in some points. According to Lampadius, its colour resembles that of copper, but is deeper, and the lustre is considerable. It is brittle, but when in thin plates, its elasticity is considerable.

When titanium is boiled with nitric acid, no remarkable effect ensues, but the bright spots disappear, and are succeeded by a white compound. Nitro-muriatic acid forms also a white powder, which remains suspended in it. Sulphuric acid exhibits a similar appearance, sulphurous acid is disengaged, and the titanium is partly changed to a white oxyd, and partly dissolved. Muriatic acid dissolves titanium, but not its oxyd.

The solution of titanium gives a white precipitate with alkaline carbonates, a grass-green mixed with brown with prussiate of potash, and a dirty dark green with the hydro-sulphurets. Infusion of galls precipitates a reddish-brown substance, which, if the solution be concentrated, has the appearance of blood. A rod of tin immersed in the solution imparts to the liquid round it a fine red colour, and a rod of zinc a deep blue.

Titanium tarnishes by exposure to the air, and is oxydized when heated in contact with it. It can exist in three states of oxydation; the first is blue or purple, the second red, and the third white. The white oxyd is the only one the composition of which is accurately known. It has been shewn by Vauquelin and Hecht to consist of eighty parts of red oxyd, and eleven of oxygen. Titanium has not yet been combined with sulphur, but has been combined by Mr. Chenevix with phosphorus.

The only alloy of any consequence which it forms is with iron; it is of a grey colour, interspersed with brilliant particles, and is quite infusible. The above are the principal properties of this metal which have yet been discovered: it has not hitherto been applied to any useful purpose in the arts.

The ores of titanium have been divided into six species by mineralogists; *viz.* menachanite, iserine, nigrine, sphene, rutile, and octahedrite.

Menachanite is so called from the valley of Menaian, in Cornwall, where it was originally found. It occurs also on the shores of the island of Providence, and in the vicinity of Richmond, in the United States of America; and also at Botany Bay, in New South Wales. It is found in small angular grains, which are of a greyish or iron-black colour, and have a rough glimmering surface. From its appearance it has been confounded with iron-sand, but its magnetic attraction is much weaker: it is less hard, and may be distinguished by its fracture, and particularly by the lustre, which approaches to semi-metallic. The fracture is imperfectly foliated: the fragments are angular and sharp-edged, and it is perfectly opaque. It yields to the knife, retaining its colour in the streak. It is opaque and brittle. The specific gravity, according to Gregor, is 4.427; but as given by Lampadius, is 4.270. Menachanite is infusible by the blowpipe without addition, but tinges borax of a greenish-brown colour. Its constituent parts, according to Klaproth, are

Cornwall.

Iserine is so called from having been originally found near the source of the river Iser, in Silesia: it is disseminated in granitic sand, with iron-sand. It occurs also with similar sand in the bed of the river Don, in Aberdeenshire. It is suspected by professor Jameson to be associated with trap-rocks; and from the observations of M. Cordier, that it is found as a constituent part of lava, this opinion is rendered the more probable. Iserine is of a brownish iron-black colour. It is found in small grains and rolled pieces, with a rough and glimmering surface. The internal lustre is semi-metallic. Its fracture is conchoidal, which distinguishes it from menachanite, to which it bears a near resemblance. The specific gravity is 4.5. Before the blowpipe it melts into a blackish-brown coloured glass, which is slightly attracted by the magnet. The mineral acids have no sensible effect on it, but the acid of sugar extracts a portion of the titanium. According to Dr. Thompson, its constituent parts are

Oxyd of titanium	-	-	48
Oxyd of iron	-	-	48
Oxyd of uranium	-	-	4
			100

Nigrine; Titane oxyde ferrifere of Haüy, is so called on account of its colour, which inclines to a velvet-black. It occurs, like the preceding species, in angular grains and in rolled pieces. The external lustre is glistering, that of the fracture shining: the structure is imperfectly foliated. It is opaque, and harder than menachanite. Nigrine is brittle, and gives a yellowish streak. The specific gravity varies from 3.700 to 4.740. It is not attracted by the magnet, and is infusible by the blowpipe, but with the addition of borax melts to a transparent hyacinth red globule. The acid of sugar extracts the titanium from this ore. It is found in alluvial ground in Transylvania, Bavaria, and the island of Ceylon: it occurs also in the granite of the Uralian mountains.

The constituent parts of nigrine are given as under :

Transylvania.

Octahedrite; Schorl bleu, Romé de Lisle; *Titane anatase*, Haüy. This ore of titanium is so called from its constant occurrence in crystallized forms, which are varieties of the octahedron.

octahedron. The crystals are small; the surface is transversely striated, and has a semi-metallic lustre: the internal lustre is also splendid. The structure is foliated. This mineral is more or less semi-transparent; it scratches glass, and is brittle. The specific gravity, according to Häuy, is 3.8571. The colour of octahedrite is indigo-blue, passing through many shades to brown. It is infusible by the blowpipe, but with borax it forms a reddish-brown coloured glass. At the extremity of the flame, the brown colour changes to blue, and becomes opaque; by the continued action of the blowpipe, the brown colour reappears, and may be again changed by variation of temperature. This mineral is rare: it occurs in veins with felspar, axinite, rock-crystal, and chlorite, in the primitive rocks of Dauphiny, and in drusy cavities in limestone, at Hadeland, in Norway.

Sphene and Rutile.—These ores of titanium have been already described. (See SPHENE and RUTILE.) In addition to those articles we may state, that common sphene has been discovered in small crystals in the sienite of the mountains in Galloway, and on the south side of Loch-Nefs; in the granite of Bennevis and Aberdeen; and also in other parts of Scotland. Rutile has also been discovered in the granite of Cairngorrum, and near to Beddgelert, in Carnarvonshire.

TITANOS, a word used by some authors to express lime; by others for the calc of burnt gypsum or plaster of Paris, and by others a lixivium of quicklime.

TITANS, TITANES, *TITANES*, in the *Ancient Mythology*, the sons of Uranus or Cælus, and Vesta, or Titæa, or Terra, *i. e.* of Heaven and Earth, according to Hesiod and Apollodorus; or, which comes to the same thing, of Æther and Tellus, according to Hyginus. They are said to have derived their name from their mother, and hence the most ancient fabulous histories have made them pass for sons of the Earth. Apollodorus reckons six Titans; Oceanus, Cælus, Hyperion, Crius, Iapetus, and Saturn or Cronus: Hyginus also reckons six, *viz.* Briareus, Gyges, Sterope, Atlas, Hyperion, and Cottus; but he seems to include the hundred-handed giants in the number, which Apollodorus, and the generality of mythologists, distinguish from the Titans.

The tradition is, that Cælus, by the same wife Vesta, had Briareus, Gyges, and Cottus, the hundred-handed giants, and had chained them up in Tartarus: Vesta, the earth, their mother, resenting this treatment, raised the Titans against their father, her husband: all, excepting Oceanus, made war upon him and dethroned him, setting up Saturn in his place.

Saturn, it seems, proved no more favourable to them than his father; but continued the giants in their prison. Upon this, Jupiter revolted against Saturn; serving him as he had done Cælus; and rescued the three giants; who afterwards proved of great service to him in the war which the Titans waged against him.

This war lasted ten years: but at length the Titans were vanquished; Jupiter remained in peaceable possession of heaven; and the Titans were buried under huge mountains thrown on their heads.

Hyginus gives another origin of the Titans: he derives them from Titan, Saturn's eldest brother, by Cælus and Vesta; who, though presumptive heir of heaven, yet finding his father and mother more inclined for Saturn than for him, surrendered to him his right of succession, on condition he should not bring up any male child, that the empire of heaven might revert to his own issue the Titans.

But Jupiter, Neptune, and Pluto, having been afterwards saved by the artifice of Ops, Titan, and his sons the Titans,

made war on Saturn, who had dispossessed his father Uranus of the throne, and acquired an extensive empire, vanquished and imprisoned him; thus he continued in the power of his enemies, till Jupiter, who had been conveyed by his mother Rhea for safety to the isle of Crete, being grown up, left Crete, made war on the Titans, and delivered his father.

Having re-established him on the throne, he returned to the place of his retreat. Saturn afterwards reigned for some time in tranquillity; but upon consulting an oracle, he received information that he would be exposed to danger from the youngest of his sons. Accordingly he recurred to all possible means for getting aid of Jupiter. Having sought him in Crete, he was betrayed and constrained to make a hasty retreat into the Peloponnesus. Thither Jupiter pursued him, and obliged him to take sanctuary in Italy, under the protection of Janus.

The Titans, thus dispersed through several countries of Greece, being jealous of the power of this new conqueror, as they had been of his father's, levied troops against Saturn, and gave him battle; but being defeated, they retired into the interior parts of Spain, whither Saturn followed them. Jupiter fought them out in their retreat, and beat them for the last time near Tartessus, and with this battle terminated the war, which had lasted ten years. Saturn made his escape into Sicily, and there, as it is said, died from grief. With this last victory, and the death of Saturn, commenced the reign of Jupiter. During the war of the Titans, Atlas seized on those provinces of Africa which were remote from the centre of the empire. Pluto was settled governor of the western parts of the empire of the Titans, of the Gauls, and Spain, which government, after the death of Pluto, was given to Mercury, who is said to have become the great divinity of the Celtæ; and Jupiter reserved to himself the whole East, that is, Greece, the Isles, and that part of Asia whence his ancestors came. For the explication of the fable that represents the Titans as thrust down to Tartarus by Saturn, see TARTARUS.

The most judicious among our mythologists, such as Gerard Vossius, Marsham, Bochart, and father Thomassin, are of opinion that the partition of the world among the sons of Noah, Shem, Ham, and Japhet, was the original of the tradition of the same partition among Jupiter, Neptune, and Pluto; and hence they have been led to form comparisons between the three fabulous princes, and the three sons of the patriarch. Accordingly the learned Pezron contends that the division which was made of this vast empire, came in after-times to be taken for the partition of the world: that Asia remaining in the hands of Jupiter, the most potent of the three brothers, made him be looked upon as the god of Olympus, a celebrated mountain where he had his residence, and which was afterwards taken for heaven itself: that the sea and islands which fell to Neptune, occasioned their giving him the title of god of the sea: and that Spain, the extremity of the then known world, thought to be a very low country in respect of Asia, and famous for its excellent mines of gold and silver, falling to Pluto, occasioned him to be taken for the god of the infernal regions. However this be, the empire of the Titans, according to the ancients, was very extensive. These princes were possessed of Phrygia, Thrace, a part of Greece, the island of Crete, and several other provinces, to the inmost recesses of Spain. To these Sanchoniathon seems to join Syria; and Diodorus adds a part of Africa and the kingdoms of Mauritania.

F. Pezron, in his *Antiquity of the Celtæ*, makes that people to be the same with the Titans; and their princes the same with the giants in Scripture. According to him,

the Titans were the descendants of Gomer, the son of Japhet. He adds, that the word Titan is perfect Celtic, and derives it from *tit*, earth, and *den* or *ten*, man: and hence it was the Greeks also called them very properly *γηννηται*, *q. d. terrigenæ*, earth-born.

Banier observes, that although most of the ancients have confounded the giants (see *Rebel GIANTS*) with the Titans, they ought to be distinguished. The latter, he says, were of an illustrious family, and extended their empire over one part of the world; the others were so many banditti dispersed over Thessaly, who occasioned great trouble to the Titans. Hesiod distinguishes them from one another, and states that the giants were not born till long after the overthrow of the Titans, and after the wars which these carried on against the others. The occasion of confounding them seems to have been, that both the giants and the Titans made war upon the gods; with this difference, that the Titans, though of the same race, had often separate interests; some taking part with Saturn, and others of them with Jupiter: whereas the giants were a gang of robbers, who had a design equally upon all the Titans. Both giants and Titans were represented as sons of Heaven and Earth, and hence they have been confounded, for want of considering, what Apollodorus says, that Earth brought forth the giants only because she was incensed against Jupiter for keeping the Titans shut up in Tartarus. Thus the Titans were born long before the giants.

The Titans, according to the learned Mr. Bryant, were those Cuthites, or sons of Chus, called *giants*, who were employed in building the tower of Babel, and who were afterwards dispersed. See *DISPERSION of Mankind*.

He supposes that they were denominated from their religion and place of worship, *Titea*, which is represented as the mother of these people, being compounded of *Tit-aiā*, and signifying literally *a breast of earth*, analogous to *τιθος αις* of the Greeks, and therefore expressing the figure as well as the materials of the ancient altars, which consisted of a conical hill of earth, in the shape of a woman's breast. These altars were also called *Tit-an* and *Tit-anis*, from the great fountain of light, styled *An* and *Anis*. Hence many places were called *Titanis* and *Titana*, where the worship of the sun prevailed; for *Anes* and *Hanes* signified the *fountain of light* or *fire*. Titana was sometimes expressed Tithana, and by the Ionians Tithena; and Tithena was said to be the nurse of the Titans. But Titæa their mother, and Tithena their nurse, were all of the same nature, *viz.* altars raised of soil. Hesiod, in his account of the dispersion of the Titans, and of the feuds which preceded (*Theogon.* ver. 676, &c.), says that the Deity at last interposed, and put the Titans to flight, and condemned them to reside in Tartarus at the extremities of the earth; but Mr. Bryant observes, that he has confounded the history by supposing the giants and Titans to have been different persons. The sons of Chus, he says, were the aggressors in those acts of rebellion described by the poets as the war of the giants, who were also represented under the character of the Titanians. The fictions of the poets with regard to the banishment of the Titans after their war against heaven, took their rise from this true history. A large body of Titanians, after the dispersion, settled in Mauritania, upon the Atlantic ocean, which is the region styled Tartarus, and represented as the realms of night, because it was situated in respect to Greece towards the regions of the setting sun. The term *ζοφος*, by which it was expressed, signified both the west and darkness; as did also Erebus, *ערב*, whence Erebus, which was also another name for Tartarus, to which the poets condemned the Titans and giants. The first war of the Titans, accord-

ing to this ingenious writer, consisted in acts of apostacy and rebellion against heaven: and this refers to that part of the history of the sons of Chus, which represents them as building a mighty city in the region, which they had usurped, and erecting a lofty tower, to prevent their being scattered abroad: but there was another war in which they were engaged with men, which happened in consequence of the dispersion. This was no other than the war mentioned by Moses, which was carried on by four kings of the family of Shem, against the sons of Ham and Chus, to avenge themselves of these enemies by whom they had been greatly aggrieved. See Bryant's *Analysis of Ancient Mythology*, vol. iii. p. 48, &c. p. 71, &c.

The word Titan is also used by the poets for the sun; in which case it is likewise Celtic, though from another root, being formed from *ti*, house or habitation, and *tan*, fire.

Hesychius observes, that Titan is likewise used for Iodomite. He adds, that it is also one of the names of antichrist; in which sense it must be written *Teitan*, in Greek, to contain the numeral letters of 666, which in the Apocryphes, xiii. 18. is the number of the beast.

TITANUS, in *Ancient Geography*, a town of Asia Minor, on the coast of the Æolide, on the banks of a river of the same name.

TITARESSUS, a town of Asia, in Lesser Armenia, in the country named Melitane. Ptol.

TITAREBUS, or TITARESSUS, a river of Thessaly, mentioned by Homer, which had its source in mount Titarus.

TITATY, in *Geography*, a town of Bengal; 55 miles N. of Dinagepour.

TITCHFIELD, a small market-town in the hundred of the same name, in the Portdown division of the county of Hants, England; is situated near the Titchfield river, 3 miles W. from Fareham, and 78 miles S.W. from London. It is inhabited by many respectable families. The church, which is the only object of particular notice, is a spacious edifice, of the workmanship of different ages: the N. side is said to have been built by William of Wykeham; but the S. side is more ancient. In the S. chancel is an interesting monument to the memory of sir Thomas Wriothesley, first earl of Southampton, Jane his lady, and Henry their son, the second earl; all of whom are represented by effigies on the tomb. Four annual fairs are held in Titchfield; and a weekly market on Saturdays. The population of the parish, under the act of 1811, was returned as 3227, the number of houses at 553.

At a short distance from the town, on the N., are the ruins of Titchfield House, the ancient seat of the Wriothesleys. It was erected, by the first earl of Southampton, on the site, and with the materials of an abbey, founded for Premonstratensian canons, by bishop Peter de Rupibus, in the year 1231. The annual revenues of this establishment, at the period of the dissolution, amounted, according to Dugdale, to 246*l.* 16*s.* 1*d.*; but according to Speed, to 280*l.* 19*s.* 4½*d.* Its possessions were then granted by Henry VIII. to his favourite secretary, Wriothesley, who built here, Leland reports, "a righte statelie house embattled, and having a goodlie gate, and a conducte castelid in the middle of the court of it, in the very same place wher the late monasterie stode." This building is now in a very dilapidated state: the entrance gateway is the principal part left standing; sixteen rooms having been recently pulled down for the sake of the materials. The estate is the property of John Delmé, esq. of Cam's Hall. In Titchfield House, Charles I. was concealed after his escape from Hampton Court in 1647, and previous to his resigning himself to colonel Hammond,

who conducted him to the Isle of Wight.—*Beauties of England and Wales*, vol. vi. Hampshire; by J. Britton and E. W. Brayley.

TITCHVIN, a town of Russia, in the government of Novgorod, on the river Sias; 84 miles N.N.E. of Novgorod. N. lat. 59° 52'. E. long. 33° 14'.

TITE. See **TIGUR**.

TITEA, in *Mythology*, the wife of Uranus or Cælus, by whom he is said to have had eighteen children, each of which had his own name, though they were generally designated by the appellation of *Titans*; which see. This princess, after her death, received divine honours, and she was called after her name.

TITERUD, in *Geography*, a town of Norway, in the province of Aggerhuus; 38 miles N. of Christiana.

TITHENIDIA, τῆθενιδία, in *Antiquity*, a Spartan festival, so called from τῆθενία, *nurses*, who at this time carried the male infants committed to their charge to the temple of Diana Corythallia. For the ceremonies observed on this occasion, see Potter, *Archæol. Græc. lib. ii. cap. 20. tom. i. p. 432, seq.*

TITHES, **TYTHES**, *Tenthæ*, *Decima*, or *Diximes*, the tenth part of the increase, yearly arising and renewing from the profits of lands, the stock upon lands, and the personal industry of the inhabitants; allotted to the clergy for their maintenance.

Tithes essentially differ from *offerings*, *oblations*, and *obventions*, which are the customary payments for communicants at Easter, for marriages, christenings, churching of women, burials, and such like. See **OBLATIONS**.

Tithes, with regard to their several kinds or natures, are *personal*, *predial*, and *mist*.

TITHES, *Personal*, are those due or accruing from the profits of labour, art, trade, navigation, and industry of men; and of these, only the tenth part of the clear gains and profits is due; after charges deducted.

TITHES, *Predial*, are those which arise merely and immediately from the ground; as grain of all sorts, hay, wood, fruits, herbs; for a piece of land or ground, being called in Latin *predium* (whether it be arable, meadow, or pasture), the fruit or produce of it is called *predial*.

TITHES, *Mist*, are those which arise not immediately from the ground, but from things immediately nourished by the ground, as from beasts, and other animals fed with the fruits of the earth; as colts, calves, lambs, chickens, milk, cheese, eggs.

Tithes, with regard to their value, are divided into *great* and *small*.

TITHES, *Great*, are those of corn, hay, and wood.

TITHES, *Small*, are the *predial* tithes of other kinds, together with those that are called *mist* and *personal*. It is said, that this division may be altered by custom, which will make wood a small tithe in the endowment of the vicar; by quantity, which will convert a small tithe into great, if the parish is generally cultivated with it; and by change of place, which makes the same things, *e. g.* hops in gardens, small tithes, in fields great tithes. But it has been admitted, that the quantity of land within any parish, that is cultivated for a particular produce, cannot change the nature of the tithe: and, according to this opinion, the law is now settled, that the tithes are to be denominated *great* or *small*, according to the nature and quality of them, and not according to the quantity.

It has been said by lord Coke and many others, that before the council of Lateran in the year 1180, a man might have given his tithes to what church or monastery he pleased; but this is denied by Dr. Prideaux. It is now certain, that

tithes of common right do belong to that church, within the precincts of whose parish they arise; and this regulation, corresponding with the ancient law of the land, was enjoined by a decretal epistle of Innocent III. to the archbishop of Canterbury, in the year 1200. (2 Inst. 641. 2 Blackft. Com. 27.) But though one person may prescribe to have tithes within the parish of another; this is what is called a "portion of tithes." (Gibf. 663.) Tithes extra-parochial, or within the compass of no certain parish, belong to the crown, and may be granted to whom the king will. 1 Roll's Abr. 657. 2 Inst. 647.

It is a general rule, that of common right tithes are to be paid for every thing that yields an annual increase; but this rule admits of exceptions, *e. g.* tithe is due from saffron, though gathered but once in three years; and on wood that is felled or lopped, called *sylva cadua*, though it is not renewed every year: and on the other hand, tithes shall be paid for the produce of seeds, as of clover, sown on the same ground, though renewed oftener than once a year. No tithes shall be paid of common right for any thing that is of the substance of the earth, or which is not of annual increase, as stone, lime, coal, tin, lead, and such like; nor for creatures that are *fera natura*, or of a wild nature, as deer, hawks, fish, &c. whose increase so as to profit the owner is not annual, but casual; unless tithes in either of these cases are payable by custom. Degge, p. 2. c. 8. 1 Inst. 651. 664.

Lands, and their occupiers, may be exempted or discharged from the payment of tithes, either in part or totally, by a real composition, or by custom and prescription.

A *real* composition is when an agreement is made between the owner of the lands, and the parson or vicar, with the consent of the ordinary or patron, that such lands shall for the future be discharged from payment of tithes, by reason of some land, or other real recompence given to the parson, in lieu and satisfaction thereof. But these compositions are now restrained by the disabling statute 13 Eliz. cap. 10. See **COMPOSITION**.

A parson may bind himself by *deed* to accept of a composition for tithes during life, or incumbency of a particular living. It is also very common to agree by *parol* for an annual composition for tithes, which binds the parties to it till sufficient notice given of dissent from the agreement, but what is sufficient notice to determine such an agreement, has never been decided in terms. See **LEASES by Statute**.

A discharge by custom or prescription is, where time out of mind such persons, or such lands, have been either partially or totally discharged from the payment of tithes. The difference between *custom* and *prescription* is this: *Custom* is that which gives right to a province, county, hundred, city, or town, and is common to all within the respective limits; in pleading of which it is alleged, that in such a county or the like, there is, and time out of memory hath been, such a custom used and approved therein. *Prescription* is that which gives a right to some particular house, farm, or other thing; in pleading of which it is alleged, that all they whose estate is had in such land, have time out of mind paid so much yearly, or the like, in full satisfaction of all tithes arising on those lands. (Gibson, 674.) And there is this difference between a prescriptive and customary modus, that the former is annexed to the lands which it covers, whereas the latter exists in action of law, independent of the lands by force of the custom of the district. In a prescriptive modus, therefore, the lands must be definite, and not liable to shift. And therefore a bill to establish a modus for every ancient farm, but not setting out the abutments of each, was dismissed,

TITHES.

dismissed, although it was stated that the whole parish consisted of ancient farms. (See CUSTOM and PRESCRIPTION.) This custom, or prescription, is either *de modo decimandi*, (see MODUS Decimandi,) or *de non decimando*. No modus can be established at this day, but by act of parliament. A modus founded upon good considerations may be in various ways discharged, and tithes become due in kind: as,

1. Where land is converted to other uses: so, when the prescription is for hay and grafs, specially, in so many acres of land; if the land is converted into a hop-garden or tillage, the prescription is gone.

2. By the alteration or destruction of the thing for which the money was paid: as where two fulling-mills were under the same roof, and turned into a corn-mill; where also there was one pair of stones in a mill, and another pair was added; and where the water-course was altered by the owner, and the mill was pulled down and re-edified upon it; in all these cases, it was adjudged that the modus was gone. But where a man was seised of eight acres of meadow and one of pasture, for the tithes whereof he had paid time out of mind *5s. 4d.* and afterwards the owner built a corn-mill upon the same; it was adjudged that he should pay no tithes for the corn-mill, because the land was discharged by the modus. 2 Inst. 490.

3. By non-payment of the consideration, or payment of tithes in kind, for so long a time as to destroy the possibility of making proof that such custom or prescription was: but an interruption for some short time only, will not discharge it; especially if made by the lessee, to the prejudice of the lessor. Watf. c. 47.

The rule is, that the modus is to be sued for in the ecclesiastical court, as well as the very tithe; and if it be allowed between the parties, they shall proceed there; but if the custom be denied, it must be tried at the common law: and if it be found for the custom, then a consultation must go; otherwise the prohibition standeth. The like is affirmed, in case a jury upon an issue joined in a prohibition upon a modus decimandi, find a different modus; since a modus is found, they shall not have consultation. 2 Inst. 490.

The principal reason why the courts of common law prohibit the spiritual court from trying of moduses, is, that whereas every modus is less than the real value, the rule of the canon law is, that less than the real value shall not be taken, and that a custom to the contrary is void; and that the ecclesiastical and temporal laws differ in the times of limitation, forty years or under making a good custom by the ecclesiastical laws, whereas by the temporal laws it must be beyond the time of memory. Gibf. 691.

But the spiritual courts have commonly allowed and do allow pleas of modus decimandi; and the averment in the prohibition is not that they do take cognizance, but that the plea hath been offered and refused; which supposeth, that if the plea be admitted, the prohibition ought not to go. And accordingly it hath been affirmed by Doderidge and others, that the spiritual court may as well try the modus, as the right of tithes, and that a prohibition is not to be granted, till the spiritual court either refuse to admit the plea, or proceed to try it by methods different from the rules of the temporal law, as to the time of limitation, or number of witnesses, or the like. And where lord Coke contended for the contrary doctrine, it was declared by Kelynge and Twisden, that in case one libel for a modus decimandi, if the spiritual court allow the plea, they may try it. Gibf. 691.

But, notwithstanding, it seemeth now to be clearly settled, that if a modus decimandi be sued for in the ecclesiastical court, a prohibition lies to stop the trial of it, if the

modus be denied; and the reason is not upon the account that the spiritual court wants jurisdiction, but in regard of the notion the temporal law hath of custom, different from the spiritual: and seeing that every modus is due by custom, it is the common law only that can determine, what time and usage with us shall be sufficient to create such custom, that is, time beyond all memory to the contrary. Whereas by the spiritual law, sometimes ten years, sometimes twenty, they will adjudge sufficient to create a custom. And prohibitions in such cases are granted, not because the spiritual court hath not jurisdiction of the matter, but in respect of the trial which is to be by the temporal law only; and if upon the trial it be found for the modus, the proceedings shall go on in the spiritual court; if against the modus, the prohibition shall stand. Watf. c. 56.

If in the trial of a modus, the defendant permits the spiritual court to proceed to sentence, he is then too late to come for a prohibition; because it is only for defect of trial, and not for defect of jurisdiction: but a man is never too late for a prohibition, where it is for defect of jurisdiction. Bunb. 17. 10 East's Rep. 349.

A bill in equity, in the nature of a bill of peace, will also lie to establish a modus, where a suit has been instituted for tithes in kind; but a bill to establish a modus or customary payment in lieu of tithes, cannot be supported, where there has been no attempt to enforce the payment of tithes in kind. 4 Gwill. 1596.

The following moduses have been established as good, by decisions in the courts of law: One penny for ancient gardens and orchards. (Bunb. 79.) Seventeen-pence for every cow having a calf, for the tithe of the milk and calf; eleven-pence for the tithe of the milk of a milk cow, milked without a calf; for every heifer, the first year she has a calf, thirteen-pence for the milk and calf—these payable at Michaelmas. Eight-pence for every hoghead of cyder, made of apples grown in the parish; for hoard apples, one penny; for fire-wood spent on the farm, one hearth penny; for fruit, herbs, roots, and other garden stuff, a garden penny; for a colt, one penny;—these payable at Easter. (Bunb. 57.) Eight-pence for a cow, four-pence for an heifer; three shillings and four-pence, payable at Easter, for every score of sheep shorn out of the parish, and so proportionably for a less number than twenty, or for a less time than a year, for their wool and lambs. (Bunb. 171.) Two-pence an hog-head for cyder. (Roll. Abr. 649.) The non-resident occupiers of land in B. and W. to pay on Good Friday, or as soon after as demanded, four-pence an acre for the tithe of hay, and the herbage of pasture lands not ploughed or sown; but, if resident, to pay tithes in kind. (2 P. Wms. 565.) Four-pence an acre for high land, and three-pence an acre for low land. (Ibid.) Twelve-pence for an acre of low meadow, and eight-pence for an acre of high meadow, for tithe of hay. (1 Bro. P. C. 214.) One penny for hay for an ancient messuage, with the demesne lands thereunto belonging, containing 60 acres, &c. One pound six shillings and eight-pence for an ancient tenement, containing 625 acres, for hay, small tithes, and Easter offerings. (Bunb. 161.) Nine cart-loads of logwood, delivered to the rector by the lord of the manor, for himself and tenants, in lieu of all tithes. (Bunb. 279.) So of six pounds *per annum*. (Cro. Eliz. 559.) A halfpenny for each calf, in lieu of calves, payable on Wednesday before Easter. A smook penny for fire-wood. An halfpenny, payable on Shear-day, for the wool of each sheep dying between Candlemas and Shear-day. Four-pence a month, payable on Shear-day, for the tithe wool of every hundred sheep shorn in the parish, which were brought in after the 2d day of February.

Three

Three eggs for every cock and hen, duck and drake, payable on Wednesday before Easter, in lieu of tithe eggs, and chickens and ducks hatched in the parish. (Bunb. 307.) Thirty eggs for all tithes of eggs. (1 Roll's Abr. 648. 651. 2 Salk. 656.) The tenth cheese made from the 1st of May until the last of August, in discharge of the tithe of milk. (Cro. Eliz. 609.) An halfpenny for the wool of sheep fold after shearing, and before Michaelmas. (Moore, 911.) One penny *per* head for sheep brought into the parish after Candlemas, and clipped in the parish, in lieu of tithe of wool; three-pence *per* head for sheep in the parish before Candlemas, and carried out before shearing time, though the wool tithe is not then actually due. (1 Anst. 341.) It is a good modus for an innkeeper, that in consideration that he and all, &c. have paid tithe hay and grain growing upon the land belonging to the said inn, and have paid tithe for all their own cattle feeding upon the land, that they have been time, &c. discharged of the tithes of the horses of their guests agisted in the said land, when they travel by the said inn; for some have said that this was but a personal tithe, and others have said that no tithes should be paid for such *agistment* by the common law, without any modus. 9 Vin. Ab. 13.

The things that are titheable are, for the most part, as follow: corn is a predial great tithe, and titheable according to the custom of the place, commonly by the tenth shock, cock, or sheaf. Beans and pease, expended in the house, are subject to no tithes; but if they are gathered to be sold, or to feed hogs, they are titheable, and are in their nature great tithes. Hay is a predial great tithe, and is to be tithed in swathes or cocks, according to the custom of the place. Clover, rape, and woad, are small tithes; heath, furze, and broom are also titheable: but no tithe shall be paid of fern. (2 Inf. 652.) The tithe *agistment* is a small tithe, and due of common right. Wood is a predial tithe, but whether great or small, hath been questioned between the parsons and the vicars; but it has been resolved, that if a vicar be only endowed with the small tithes, and has always had tithewood, in such case it shall be accounted a small tithe, otherwise it is to be accounted among the great tithes. Timber fit for building of houses and ships, and comprehending oak, elm, and ash, are exempted from tithes, by 45 Edw. III. c. 3; but timber-trees, cut and corded for fuel, have been adjudged to pay tithes, as well as under-wood; however, no tithe shall be paid for the roots of trees, for wood cut for husbandry or fuel, for hurdles of sheep, for hop-poles, and for making of bricks, and also fruit-trees. When the wood is titheable, it is set out while standing by the tenth acre, pole, or perch; or, when cut down, by the tenth faggot or billet. Of under-woods sold standing, the tithe shall be paid, not by the seller, but by the buyer. The tithe of flax and hemp is a small tithe, and by statute this is charged at 5s. *per* acre. (11 & 12 Will. c. 16.) The tithe of madder is also a small tithe, and charged at 5s. *per* acre, by 31 Geo. II. c. 12. The tithe of hops is predial, and reckoned among small tithes; it is not to be paid till after they are picked, and before they are dried, every tenth measure. Out of gardens is paid tithe of all garden herbs and plants, which are small tithes, and may be demanded in kind: potatoes and turnips are also small tithes, as are likewise tobacco and saffron. However, in lieu of the tithes of gardens, a certain consideration in money is paid, either by custom, or by agreement with the parson. Fruits of trees, as apples, pears, plums, cherries, and the like, are predial tithes, to be paid in kind when they are gathered, unless there is some modus, or rate-tithe, paid in lieu of them. The tenth calf is due to the parson of common right; and if there are seven, he

shall have one; if under seven, a halfpenny, or what custom shall direct, for each calf. But in most places, at this day, the custom hath obtained, that if there are five, the parson shall have the value of half a calf, lamb, or other such like; if there are six, he shall have one entire; and shall receive or pay out respectively a proportionable sum for each number under five, or above six. Colts and pigs are titheable in the same manner as calves; and the time of payment of these tithes is when they are so old that they may be weaned. Wool and lamb are generally reckoned mixt small tithes. Milk is a mixt tithe: where tithe-milk is paid in kind, no tithe-cheefe is due; and where tithe-cheefe is paid in kind, no tithe-milk is due. The tithe of milk is to be paid, not by the tenth part of every meal, but by every tenth meal entire. Deer and conies, being *feræ naturæ*, are not titheable of common right, but by special custom. Of fowls, which are domestic, as geese, hens, and ducks, tithes are to be paid, either by paying the tenth egg, or the tenth of their young, according to custom. It hath been adjudged, that the paying of thirty eggs in Lent, is a good modus for all tithes of eggs. Bees are free of tithes, but the wax and honey are chargeable at the rate of the tenth measure of honey, and the tenth weight of wax. By the books of common law it appears, that some tithe or other is due for a mill. Fish in ponds and private fisheries, and in common rivers, are titheable only by custom. Fish taken in the sea are chargeable by custom as a personal tithe. Personal tithes are regulated by stat. 2 & 3 Edw. VI. c. 13; but personal tithes are now scarcely any where paid in England, unless for mills or fish caught in the sea, and then payable where the party hears divine service, and receives the sacrament.

The manner or form of setting out or payment of tithes, is for the most part governed by the custom of the place. The parson, vicar, impropriator, or farmer, cannot come himself, and set forth his tithes, without the licence and consent of the owner; for if of his own head he shall tithe the corn or hay of any land-holder within his parish, and carry it away, he is a trespasser, and an action will lie against him for it. But every person is bound of common right, to cut down, and set out the tithes of his own lands. And that it may be done faithfully and without fraud, the laws of the church entitle the parson to have notice given him; but by the declaration of the common law, such notice is not necessary. Yet nevertheless, the common law declareth a custom of tithing without view to be an absurd custom: and by the statute of 2 & 3 Ed. VI. c. 13. it is enacted, that at all times whensoever, and as often as any predial tithes shall be due at the tithing of the same, it shall be lawful to every party to whom any of the said tithes ought to be paid, or his deputy or servant, to view and see their said tithes to be justly and truly set forth and severed from the nine parts.

The care of the tithes, as to waste or spoiling, after severance, rests upon the parson, and not upon the owner of the land. For it seemeth that the parson is at his peril to take notice of the tithes being set out; and so it hath been declared, that although the parishioner ought *de jure* to reap the corn, yet he is not bound to guard the tithes of the parson. Gibf. 689.

But after the tithes are set forth, he may of common right come himself, or his servants, and spread abroad, dry and stack his corn, hay, or the like, in any convenient place or places upon the ground where the same grew, till it be sufficiently weathered and fit to be carried into the barn. But he must not take a longer time for the doing thereof, than what is convenient and necessary; and what shall be deemed a convenient and necessary time, the law doth not nor can define; for the quantity of the corn or hay, and the weather,

TITHES.

ther, in this case are to be considered; and what shall in this and all other cases of like nature be said to be a reasonable and convenient time, is to be determined by the jury, if the point come in issue triable by a jury; but if it come to be determined upon a demurrer, or other matter of law, the judges of the court where the cause depends are to resolve the same. Deg. p. 2. c. 14. Str. 245.

And it shall be lawful quietly to take and carry the same away. And if any person carry away his corn or hay, or his other predial tithes, before the tithe thereof be set forth; or willingly withdraw his tithes of the same, or of such other things whereof predial tithes ought to be paid; and if any person do stop or let the parson, vicar, proprietor, owner, or other their deputies or farmers, to view, take, and carry away their tithes, as is above said; he shall forfeit double value, with costs; to be recovered in the ecclesiastical court. 2 & 3 Ed. VI. c. 13.

And he may carry his tithes from the ground where they grew, either by the common way, or any such way as the owner of the land useth to carry away his nine parts. But if there are more ways than one, and the question is, which is the right way, this is cognizable in the temporal court. Deg. p. 2. c. 14.

It seems, that if tithes set forth remain too long upon the land, the owner of the soil may take them damage feasant; but then, if he be sued for them, in order to justify, he must set forth how long they had remained before he took them; and when they shall be said to remain too long is triable by the jury. Watf. c. 54.

Or an action upon the case will lie against the parson for his negligence in this behalf: but no action in such case will lie, unless the parishioner hath duly set forth his tithes, and hath also given notice to the parson, that they are so set forth. Deg. p. 2. c. 14. L. Raym. 187.

But the occupier of the ground cannot put in his cattle and destroy the corn or other tithe: for that is to make himself a judge, what shall be deemed a convenient time for taking it away: but the court and jury, upon an action brought, are to determine of the reasonableness of the time, and of the recompence to be made for the injury sustained. L. Raym. 189.

Tithes are recoverable in the spiritual court by the canon law, and by divers statutes, as the statute of *circumspexisse agatis*, 13 Edw. I. st. 4; the statute of *articuli cleri*, 9 Edw. II. st. 1. c. 1. 18 Edw. III. st. 3. c. 7. 1 Rich II. c. 13, 14. 27 Hen. VIII. cap. 20. 32 Hen. VIII. c. 7. 2 & 3 Edw. VI. c. 13. 7 & 8 Will. III. c. 6. 34. 1 Geo. st. 2. c. 6. 27 Geo. II. c. 20.

Tithes in London are subject to particular regulations. By a decree made in 1545, according to the statute 37 Hen. VIII. c. 12. it is ordered, that the citizens and inhabitants of London and its liberties, shall yearly pay their tithes to the parsons, vicars, and curates, after the rate of 16½*d.* for every 10*s.* annual rent, and 2*s.* 9*d.* for every 20*s.* rent, and so above the rent of 20*s.* by the year, ascending from 10*s.* to 100*s.*, according to the said rate. The wife, children, servants, or others of their family, taking the rites of the church at Easter, shall pay 2*d.* for their four offering days yearly, &c. Notwithstanding the settlement of this decree, divers prescriptions for the payment of lesser rates than the parsons might require by it (as to pay 10*s.* for the tithe of a house, although its rent was 40*l.* a year, or more) have been gained and allowed. But by 22 & 23 Ch. II. c. 15. after the fire of London, annual certain tithes, or sums of money in lieu of tithes, for fifty-one churches, were appointed to be raised by assessments, in the manner prescribed by the said act. For the stipends of the ministers of

the fifty new churches, provision is made by the several acts of parliament relating to them, to be raised from the duties on coals. There are also particular statutes for particular churches, in London and in other places.

Original and History of Tithes.—The custom of giving or paying tithe is very ancient; in Gen. xiv. 20. Abraham gives Melchisedech the tenth of all the spoils he had taken from the four kings he had defeated: in Gen. xxviii. 22. Jacob makes a vow at Bethel, to give the tenth of all the riches he shall gather in that sojourn, to God.

But these tithes were free and voluntary, and, besides, differed in divers other respects from what was afterwards called tithe: what Melchisedech received, was only the tenth of the spoils, not of Abraham's possessions; and this once, not annually; and beside, not as maintenance, which Melchisedech wanted not, but as homage: add, that this was only from one priest to another; for Abraham had not only a priest in his loins, but was a priest himself. And as to Jacob, who was also a priest, what he did was the effect of a vow, voluntarily taken, to offer the tenth of all he should possess; not to any other priest, but to God himself upon an altar.

Tithe was first legally enjoined by Moses, Lev. xxvii. 30. Numb. xviii. 21. Deut. xiv. 22. That legislator obliged the Israelites to the payment of several kinds of tithes: as,

1. The *first tithe* מעשר הראשון, which was a tithe of all the fruits given to the Levites: this was not taken till after the oblation called תרומה *terumah*, which was a tenth part allotted to the priests, had been made.

2. The *second tithe* was a tenth part of the nine remaining, after payment of the first tithe. This tithe was set apart in each family, and the master of the family was obliged to carry it to Jerusalem, and to use it there; or, in case he could not, he was to redeem it, or convert it into money: in which case he was to add a fifth to it, and carry the money to Jerusalem.

3. The *tithe of the tithe*, was the tenth part of all the tithes that had been given to the Levites by the people: for the Levites, after they had got all their tithes of the people, divided the whole into ten parts; and in their turn gave a tithe to the priests.

4. The *tithe of the third year* was another kind of tithe, not much different from the second tithe, excepting that it was less troublesome; because they did not carry it to Jerusalem either in kind, or in money, but kept it by them, to be spent by the Levites, the strangers, the fatherless, and the widows of the place, Deut. xiv. 28, 29. This was also called the *tithe of the poor*, and the *third tithe*; and these third years when it was paid, were called the *tithe-years*. Several learned Jews and Christians, however, conceived that this was not a distinct tithe, but the same as the second; so that, as Mr. Mede apprehends, what was wont in other years to be spent in feasting, was every third year spent upon the poor. All these tithes are calculated to amount to above one-sixth of the revenue of each person.

These matters are all farther explained in the Talmud, in which are two books on tithes; also in the book of benedictions, ברכות, in the commentaries of Bartenora, Maimonides, R. Schelomoh Jarrhi, in Scaliger, Amama, Selden, Frischmuth, Quenited, Varenius, Hottinger, Sigonius, Cunæus, Godwyn, Leidecker, &c.

Under the new law, tithes are not established by Jesus Christ, or Christian dispensation, as they were under the old law by the ministry of Moses; the Christian priests, and the ministers of the altar of the new covenant, lived at first wholly upon the alms and oblations of the devout.

In after-times, the laity gave a certain proportion of their revenues

revenues to the clergy, but voluntarily, and not out of any constraint or obligation: the first instances we have of this, are in the fourth and fifth centuries.

This gift was called tithe, not that it was really a tenth part of their income, or near so much; but only in imitation of the tithes of the old law.

In the following age, the prelates in their councils, in concert with the princes, made an express law to the purpose; and obliged the laity to give a full tenth part of their revenues, their fruits, &c. to the ecclesiastics.

This the church enjoyed without disturbance for two or three centuries; but in the eighth century the laity got hold of part of these tithes, either by their own authority, or by grants and donations of the princes; and appropriated them to their own uses.

Some time afterwards they restored them, or applied them to the founding of monasteries or chapters, and the church consented, at least tacitly, to this restitution. In 1179, the third council of Lateran, held under Alexander III. commanded the laymen to restore all the tithes they yet held to the church.

In 1215, the fourth council of Lateran, held under Innocent III., moderated the matter a little; and, without saying any thing of the tithes which the laity already possessed, forbade them to appropriate or take any more for the future.

We may observe, that, upon the first introduction of tithes, though every man was obliged to pay tithes in general, yet he might give them to what priests he pleased, which were called *arbitrary consecrations of tithes*: or he might pay them into the hands of the bishop, who distributed among his diocesan clergy the revenues of the church, which were then in common. But when dioceses were divided into parishes, the tithes of each parish were allotted to its own particular minister; first by common consent, or the appointments of lords of the manors, and afterwards by the written law of the land. However, arbitrary consecrations of tithes took place again afterwards, and became in general use with us till the time of king John. This was probably owing to the intrigues of the regular clergy, or monks of the Benedictine and other rules, and will account for the number and riches of the monasteries and religious houses which were founded in those days, and which were frequently endowed with tithes. But in process of years, the income of the laborious parish-priests being scandalously reduced by these arbitrary consecrations of tithes, it was remedied by pope Innocent III. about the year 1200, in a decretal epistle, sent to the archbishop of Canterbury, and dated from the palace of Lateran, which enjoined the payment of tithes to the parsons of the respective parishes, where every man inhabited, agreeably to what was afterwards directed by the same pope in other countries. This epistle, being reasonable and just, and correspondent to the ancient law, was allowed of, and became *lex terra*. This put an effectual stop to all the arbitrary consecrations of tithes; except some footsteps which still continue in those *portions of tithes*, which the parson of one parish hath, though rarely, a right to claim in another: for it is now universally held that tithes are due, of common right, to the parson of the parish, unless there be a special exemption. This parson of the parish may be either the actual incumbent, or else the appropriator of the benefice: appropriations being a method of endowing monasteries, which seems to have been devised by the regular clergy, by way of substitution to arbitrary consecrations of tithes.

Fa. Paolo, in his "Treatise of Beneficiary Matters," is of opinion, that the custom of paying tithes, under the new

law, began in France; and affirms, that there are no instances of it before the eighth and ninth centuries: but he must be mistaken; for in the second council of Matiscona, held in 585, it is said expressly, that the Christians had a long time kept inviolate that law of God, by which tithe of all their fruits was enjoined to be given to the holy places, &c.

In effect, Origen (Hom. xi. on Numb.) thinks, that the old laws of Moses, touching the first-fruits and tithes, both of cattle and of the fruits of the earth, are not abrogated by the gospel; but ought to be observed on their ancient footing.

The 5th canon of the council of Matiscona orders tithe to be paid to the ministers of the church according to the law of God, and the immemorial custom of the Christians, for the use of the poor, and the redemption of captives, and that upon penalty of excommunication: which is the first penalty we find imposed on such as would not pay tithe. On which grounds it is that many among the modern clergy hold their tithes to be *jure divino*.

Others, on the contrary, plead, that the recompence to be given church ministers, is differently ordained by God, according to the differences he has put between his two great dispensations, the law and the gospel: under the law he gave them tithes; under the gospel, having left all things in his church to charity, and Christian freedom, he has given them only what shall be given them freely, and in charity. That the law of tithes is in force under the gospel, all the Protestant divines, except some among the English, deny; for though hire to the labourer be of moral and perpetual right, yet that special kind of hire, the tenth, can be of no right or necessity, but to the special labour for which God ordained it; that special labour was the Levitical and ceremonial service of the tabernacle, (Numb. xviii. 21. 31.) which was abolished: the right, therefore, of the special hire must be abolished too.

That tithes were ceremonial, is evident from their not being given to the Levites till they had been first offered as an heave-offering to the Lord, ver. 24. 28.

He, then, who by the law brings tithes into the gospel, brings in likewise a sacrifice, and an altar; without which, tithes, by the law, were un sanctified and polluted, ver. 32. And, therefore, they were never thought of in the first Christian times, till ceremonial altars and oblations had been brought back.

The Jews themselves, ever since their temple was destroyed, though they have rabbies, and teachers of the law, yet pay no tithes, as having no proper Levites to whom, nor any altar upon which to hallow them; which argues that the Jews themselves never looked on tithes as moral, but merely ceremonial. Add, that tithes were not allowed to the priests and Levites merely for their labour in the tabernacle; but in consideration of this likewise, that they were not allowed to have any other part or inheritance in the land (ver. 20. 24.), and, by that means, for a tenth, lost a twelfth.

Besides, it has been urged, that the priests and Levites were properly the officers and ministers of state under God as king of Israel; and the Israelites paying through their hands one-tenth to him, was agreeable to the custom of almost all nations to pay one-tenth to their king. Tithes, therefore, are to be considered as an appendage to the theocracy, and it has been said, that it will be extremely difficult to prove, that Christian ministers have a divine right to demand them, from this circumstance of a constitution peculiar to the Jewish nation. As to the original of tithes, judge Blackstone observes, that he will not put the

TITHES.

the title of the clergy to them upon any divine right; though such a right certainly commenced, and, as he apprehends, as certainly ceased, with the Jewish theocracy; yet an honourable and competent maintenance for the ministers of the gospel is, undoubtedly, *jure divino*; whatever the particular mode of that maintenance may be. Accordingly, all municipal laws have provided a liberal and decent maintenance for their national priests or clergy: ours, in particular, have established this of tithes, probably in imitation of the Jewish law; and, perhaps, considering the degenerate state of the world in general, it may be more beneficial to the English clergy to found their title on the law of the land, than upon any divine right whatsoever, unacknowledged and unsupported by temporal sanctions. But, however beneficial this appointment may be to the clergy, it has been complained of as impolitic in a variety of respects, and peculiarly burdensome to the state.

Mr. Smith observes (*Nature and Causes of the Wealth of Nations*, vol. iii.), that tithes, as well as other similar taxes on the produce of the land, are in reality taxes upon the rent, and, under the appearance of equality, are very unequal taxes; a certain portion of the produce being in different situations, equivalent to a very different portion of the rent. In some very rich lands the produce is so great, that the one-half of it is fully sufficient to replace to the farmer his capital employed in cultivation, together with the ordinary profits of farming-stock in the neighbourhood. The other half, or, what comes to the same thing, the value of the other half, he could afford to pay as rent to the landlord, if there was no tithe. But if a tenth of the produce is taken from him in the way of tithe, he must require an abatement of the fifth part of his rent, otherwise he cannot get back his capital with the ordinary profit. In this case the rent of the landlord, instead of amounting to a half, or five-tenths of the whole produce, will amount only to four-tenths of it. In poorer lands, on the contrary, the produce is sometimes so small, and the expence of cultivation so great, that it requires four-fifths of the whole produce to replace to the farmer his capital with the ordinary profit. In this case, though there was no tithe, the rent of the landlord could amount to no more than one-fifth or two-tenths of the whole produce. But if the farmer pays one-tenth of the produce in the way of tithe, he must require an equal abatement of the rent of the landlord, which will thus be reduced to one-tenth only of the whole produce. Upon the rent of rich lands, the tithe may sometimes be a tax of no more than one-fifth part, or four shillings in the pound; whereas, upon that of poorer lands, it may sometimes be a tax of one-half, or of ten shillings in the pound.

It is a great discouragement to the improvement of land, that a tenth part of the clear produce, without any deduction for the advanced expence of raising that produce, should be alienated from the cultivator of the land to any other person whatever. The improvements of the landlord and the cultivation of the farmer are both checked by this unequal tax upon the rent. The one cannot venture to make the most important, which are generally the most expensive improvements; nor the other to raise the most valuable, which are generally too the most expensive crops; when the church, which lays out no part of the expence, is to share so very largely in the profit. When, instead either of a certain portion of the produce of land, or of the price of a certain portion, a certain sum of money is to be paid in full compensation for all tax or tithe; the tax becomes, in this case, exactly of the same nature with the land-tax of England. It nei-

ther rises nor falls with the rent of the land. It neither encourages nor discourages improvement. The tithe in the greater part of those parishes which pay what is called a *modus in lieu* of all other tithes, is a tax of this kind. Some have proposed, as a better method for raising a revenue for the clergy, to lay an equivalent tax upon all estates, cultivated or not cultivated. It is well known, and has often been lamented, even by the clergy themselves, that this method of raising a revenue for their subsistence, is a continual source of dispute between the clergy and their parishioners, and contributes to obstruct the usefulness of their ministry. In Holland, and some other Protestant countries, the civil magistrates have adopted what some have thought a better plan, by allowing their ministers a fixed stipend, paid out of the public funds.

In effect, for the first three hundred years after Christ, no mention is made in all ecclesiastical history of any such thing as tithes; though, in that time, altars and oblations had been recalled, and the church had miserably judaized in many other things. The churchmen confessedly lived all that time on free-will offerings: nor could the defect of paying tithes be owing to this, that there were wanting civil magistrates to enjoin it; since Christians, having lands, might have given out of them what they pleased; and the first Christian emperors, who did all things by advice of the bishops, supplied what was wanting to the clergy, not out of tithes, which were never proposed, but out of their own imperial revenues.

The first authority produced, setting aside the Apostolical Constitutions, which few of the patrons of the tithes will insist on, is a provincial synod at Cullen in 356, where tithes are voted to be God's rent: but before that time, divers other abuses and complaints had got ground, as altars, candles at noon, &c. And thus one complaint beget another; as it is certain that tithes suppose altars.

It is not easy to ascertain the time when tithes were first introduced into this country. About the year 794, Offa, king of the Mercians, made a law, by which he gave to the church the tithes of all his kingdom, in order, as it is said, to atone for the death of Ethelbert, king of the East Angles, whom, in the preceding year, he had caused to be basely murdered. But that they were paid in England before this time, by way of offering, according to the ancient usage and decrees of the church, appears from the canons of Egbert, archbishop of York, about the year 750, and from an epistle of Boniface, archbishop of Mentz, written about the same time to Cuthbert, archbishop of Canterbury, and from the 17th canon of the general council held for the whole kingdom at Chalchuth, in the year 787. But the law of Offa first gave the church a civil right to them in this land by way of property and inheritance, and enabled the clergy to recover them as their legal due, by the coercion of the civil power. However, this establishment of Offa reached no farther than to the kingdom of Mercia, over which he reigned; until Ethelwulph, about sixty years after, enlarged it for the whole realm of England. See REVENUE.

Judge Blackstone says, that possibly tithes in this country were contemporary with the planting of Christianity among the Saxons, by Augustine, the monk, about the end of the sixth century. But the first mention of them, which he has met with in any written English law, is in a constitutional decree, made in a synod held (as he says) A. D. 786, in which the payment of tithes in general is strongly enjoined. This canon or decree, which did not at first bind the laity, was effectually confirmed by two kingdoms of the heptarchy, in their

parliamentary conventions of estates, respectively consisting of the kings of Mercia and Northumberland, the bishops, dukes, senators, and people. This was a few years later than the time when Charlemagne established the payment of them in France, A.D. 778, and made the famous division of them into four parts; one to maintain the edifice of the church, the second to support the poor, the third the bishop, and the fourth the parochial clergy.

The next authentic mention of them is in the *Fœdus Edwardi et Guthruni*, or the laws agreed upon between king Guthrun, the Dane, and Alfred and his son Edward the Elder, successive kings of England, about the year 900. This treaty may be found at large in the Anglo-Saxon laws, and it not only enjoins the payment of tithes, but adds a penalty upon non-observance; which law is seconded by the laws of Athelstan, cap. i. about the year 930. This, he says, is as much as can be certainly traced out, with regard to their legal original. Blackst. Com. b: ii. c. iii. sect 2. Burn's Eccl. Law, vol. iii. article *Tithes*.

The custom of paying tithes, or of offering a tenth of what a man enjoys, or of what he reaps from it, has not only been practised under the old and the new law, but we also find something like it among the heathens.

Xenophon, in the fifth book of the expedition of Cyrus, gives us an inscription upon a column, near the temple of Diana, by which the people were warned to offer the tenth part of their revenues every year to that goddess.

The Babylonians and Egyptians gave their kings a tenth of their revenues: see Aristotle in his *Oeconomics*, lib. ii. Diodorus Siculus, lib. v. and Strabo, lib. xv.

Afterwards the Romans exacted of the Sicilians a tenth of the corn they reaped; and Appian tells us, that those who broke up, or tilled any new grounds, were obliged to carry a tenth of their produce to the treasury.

The Romans offered a tenth of all they took from their enemies to the gods; whence the name of Jupiter *Prædator*: the Gauls, in like manner, gave a tenth to their god Mars, as we learn in the *Commentaries* of Cæsar.—And Festus, de Verb. Signif. assures us, that the ancients used to give tithe of every thing to their gods: "*Decima quæque veteres diis suis offerebant.*"

Authors have been strangely perplexed to find the original of a custom established among so many people of different manners and religions to give a tenth to their kings, their gods, or their ministers of religion. Grotius takes it to arise hence, that the number ten is the most known, and the most common among all nations; by reason of the number of fingers, which is ten. On this account he thinks it is, that the commandments of God were reduced to ten, for people to retain them with greater ease; that the philosophers established ten categories, &c.

TITHES, Extra-parochial, denote tithes which are not within the compass of any distinct parish. By the canon law, these were to be disposed of at the discretion of the bishop; but by the law of England, all extra-parochial tithes, as, in several forests, belong to the king, and may be granted to whom he pleases. Accordingly they have been adjudged to him, not only by several resolutions of law, but also in parliament 18th Edw. I. But extra-parochial wastes and marsh lands, when improved and drained, are by 17th Geo. II. c. 37, to be assessed to all parochial rates in the parish next adjoining.

TITHES, impropriated and appropriated, called also *infeodated tithes*, are those alienated to some temporal or ecclesiastical lord, united to their fee, and possessed as secular goods. See APPROPRIATION and IMPROPRIATION.

By the council of Lateran, held under Alexander III. in 1179, the alienation or infeodation of tithes is prohibited for the future: whence all infeodations made since that time are generally held, by the canonists, illegal.

Some attribute the original of these impropriated tithes to Charles Martel; and hold him damned for first giving the revenues of benefices to secular nobles. But Baronius will have this to be a fable, and refers their origin to the wars in the Holy Land; which is also the opinion of Pasquier.

The tribute, it seems, which the Romans imposed on all the provinces of their empire, was a tenth part of all the fruits: hence several authors observe, that the Franks, having conquered the Gauls, and finding the imposition established, they kept it on foot, and gave those tithes in fee to their soldiers; and this, say they, was the origin of infeodated or impropriated or appropriated tithes. But the truth is, they are not so ancient; nor do we find any mention of them before the reign of Hugh Capet; even the very council of Clermont, held in 1097, as hot as it was in the interest of the church, does not say one word of them; which yet would undoubtedly have made loud complaints of such an usurpation, had it been then known.

TITHES, Portion of, denotes titles which the parson of one parish hath a right to claim in the parish of another. These portions, which might probably, at least in part, have been owing to the lord of a manor's estate, extending into districts which are now apportioned into distinct parishes, are in law so distinct from the rectory, that if one who has them purchases the rectory, the portion is not extinct, but remaineth grantable. The cognizance of these belongs, like that of other tithes, to the ecclesiastical court.

TITHES, as Obstructions to Agriculture, the impediments and hindrances which they throw in the way of the progress and improvement of the land and its cultivation and amendment. It has been said to be the instruction of our natural as well as revealed religion, that a portion of our property is due for the maintenance and support of the worship of God, and that "those who serve at the altar, should live by the altar;" but that whether a special proportion of one-tenth of our yearly income from land is due to the clergy by divine and unalterable right, is a point which has been warmly agitated, and much controverted. Under the Jewish government, it is well known that tithes were directed to be paid by divine appointment. And it has been stated by bishop Butler, that under the Mosaic dispensation, God himself assigned to the priests and Levites, tithes and other possessions, and that in these possessions they had a divine right; a property quite superior to all human laws, ecclesiastical as well as civil. But that every donation to the Christian church is that of a human donation, and no more; and therefore cannot give a divine right, but such a right only as must be subject, in common with all other property, to the regulation of human laws. How far the claim to tithes on the principle of divine right remains still established in Catholic countries, is not well known; but this sort of claim to tithes has long since ceased in this country. And it is remarked by a late writer, that the conduct of Henry VIII. of England, and of Charles I. of Scotland, furnishes indubitable proofs of their holding a different opinion; as those kings, on the abolition of popery, in place of transferring the tithes from the Roman Catholic clergy to their successors in office, assumed the right of granting the greatest part of them to the nobility and great laymen of the time; and in the latter kingdom in particular, with the burden only of reasonable stipends to the Protestant clergy. And further, that the grants of
tithes

TITHES.

tithes made by these kings and their successors having been either directly and indirectly ratified by parliament, are now to all intents and purposes the property of the successors of these original grantees.

The historian Gibbon has stated that tithes appear to have been common in all ages. That the first Christian emperor, Constantine the Great, was very liberal to the church; and in the year 321, published an edict, granting his subjects full liberty to bequeath any extent of property they chose to the clergy. But that this, in place of proving that a tenth of the produce was payable to the clergy in the early ages of Christianity, shews, it is thought, the direct contrary;—that the clergy, instead of having any legal right to tithes, were supported by charitable or gratuitous donations, and not by assessments made either under divine or human laws. The period or time, however, when the payment of tithes was established by law, is noticed by Montesquieu, in his Spirit of Laws, who states that no one questions but the clergy opened the bible before the time of Charlemagne, and preached the gifts and offerings of the Leviticus. But that he dares say, before that prince's reign, though the tithes might have been preached up, they were never established. And the above historian not only fixes this period, but the reason of it too, in the manner below: the synod of Frankfort, held under Charlemagne in the year 794, furnished, it is said, a cogent motive to pay the tithes. A capitulary (statute) was made in it, wherein it is said, that in the last famine the ears of corn were found to contain no seed, the infernal spirits having devoured it all; and that those spirits had been heard to reproach the people with not having paid tithes; in consequence of which it was ordained, that all those who were seized of church-lands should pay the tithes; and the next consequence was, the obligation extended to all.

The writer of a late agricultural report has stated, that in this country, tithes, or a tenth of the produce of the fruits of the earth, as well as of cattle, have been so long established, that without asserting their divine right, it may be maintained, that every estate in the kingdom was once subject to them, and that every exoneration has arisen either from encroachment, from royal grant on the dissolution of the abbeys, or from impolitic concession, by accepting a specific sum of money in lieu of them, which, as it does not vary with the times, has left the clergy in many parishes and districts of the kingdom without any adequate provision. All modes and compositions real, are, it is said, of this nature; but that, as many of these are fixed and irrevocable, it must be left to the discretion of the patrons, or the interference of the legislature, to rectify the evils which they have produced, and to fulfil the scripture maxim, that "the labourer is worthy of his hire."

And that when it is considered, that the title by which a tenth of the produce of agriculture is appropriated to the church, is far more ancient and better ascertained than that to the other nine parts, it will appear surprising that the dues of the clergy should in general be paid with reluctance, and that lay proprietors, on the contrary, should find little difficulty, either in obtaining a fair rent for their lands, or a reasonable composition for their tithes. Yet the fact is indisputable, it is said, that incumbents, however moderate in their demands, can seldom advance the composition for their tithes in any proportion to their value, without exposing themselves to obloquy and opposition; or if they take their tithes up, are frequently subject to expences and inconveniences, besides producing an unfavourable effect on agricultural improvement, to encourage which ought to be no less the object of private than of public policy.

That the farmer, when he takes a bargain of the farm kind, which is subject to tithes, will undoubtedly estimate the proportion he is to pay to the incumbent, not according to what may have been demanded twenty or thirty years ago, but what it is actually worth at the present moment; and that if, by the lenity or forbearance of the rector or vicar of his parish, he may pay less, he ought to consider it as a sacrifice that often can be ill afforded, and as laying him under an obligation which he should endeavour to return by every means in his power. Were this the case, that harmony which the good of religion, and the interest of the parties require, would, it is thought, be preserved inviolate; and that none but the extortionate incumbent would be the object of deserved enmity and reproach. The writer too has seen many good effects resulting from the proprietors of titheable land becoming personally responsible to the clergyman, and letting their estates, especially when there are no leases, tithe-free. The advantage is mutual; and it prevents misunderstandings as well as an opposition of interests, which frequently arise, when the tenant and the incumbent are left to themselves.

That, upon the whole, the rights of the clergy are exacted with extreme moderation, small as many of their livings are, in most parts of this portion of the country. That no very great part of their tithes is taken in kind, in many places; yet that notwithstanding, complaints exist of the hardship of tithes from the farmer, and of the unpleasant situation in which the incumbent is sometimes placed, by trying to raise his humble benefice to two-thirds, or even one-half of its real worth. Hence, it is conceived, there must be something radically wrong in a system, which excites prejudices in the most liberal and enlightened minds, and which equally militates against the interests of religion and those of agriculture.

Having thus briefly stated the nature of the origin of tithes, and the difficulties which attend them, as they respect the clergyman and farmer, it may be proper and necessary to inquire to what uses they were applied, after a legal right to demand them had been obtained, and how far the clergy of the present day follow out in practice the principle on which they were originally made payable. It has been remarked by the writer of the work on Modern Agriculture, that in regard to the question, whether the tithes in this part of this country be now appropriated to the uses for which they were at first paid, whether voluntarily or by compulsion? it will be necessary to go back to the first introduction of the tithing system into the country. Bede states, it is said, that about the year 597, Gregory the Great, then pope, sent a monk of the name of Austin into England, to propagate the gospel, and to introduce a system of church-government among the people. Austin having succeeded to the utmost of his wishes, and having received a grant of land from the then king of Kent, besides donations from private individuals, for the support of himself and the priests whom he had brought along with him, found it necessary to apply to the pope for directions in regard to the manner in which these royal and private donations should be applied. Gregory solved the monk's question, by replying, that it was the custom of the church to divide such voluntary gifts as Christians were pleased to bestow in four parts: to give one to the bishop, another to the inferior clergy, a third to the poor, and to set aside the fourth for erecting and upholding churches or places of worship. And in confirmation of this, it may be noticed, that Blackstone has remarked, that at the first establishment of parochial clergy, the tithes of the parish were distributed in a fourfold division; one for the use of the bishop, another

TITHES.

for maintaining the fabric of the church, a third for the poor, and the fourth to provide for the incumbent: but that when the sees of the bishops became otherwise amply endowed, the bishops were prohibited from demanding their usual share of these tithes, and the division was in three parts only. In considering the state of tithes in the fourteenth century, he likewise takes notice of an act of Richard II. enjoining the bishops to allocate a proper sum out of the tithes of each diocese, for the sustenance of poor parishioners; remarking, in addition, that it seems the people were frequently sufferers by withholding of those alms, for which, among other purposes, the payment of tithes was originally imposed.

The first of the above two writers observes farther, that at what period the superior clergy of England first possessed themselves of the tithes, in defiance of the original destination, and of many statutes made to enforce an application of them to the uses for which they were first made payable, it is unnecessary to inquire. It will not be denied, however, it is thought, by the keenest stickler for the prerogatives of the church, that in place of one-third of them being applied for the use of the officiating clergy, one-third for the support of the poor, and the remaining third for the repairs of the churches, which, when the bishops had acquired land in mortmain, or free alms, sufficient to support their dignity, was the destination originally intended; the tithes payable in England are now very differently, although not, it is said, so legally, appropriated. Those people, says the writer, who are most disposed to cry out "the church is in danger," when the real or supposed rights of the clergy are invaded by the slightest attempts to alienate the tithes, ought to reflect that the third of all the tithes in England, whether in possession of the church or of the laity, ought to be allowed for the support of the poor; that another third ought to be expended in the repairs of the churches, the expence of which is now defrayed, in almost every instance, by an assessment on the parishioners; and that the last third ought to fall to the officiating clergymen, many of whom are the most miserable of the sons of men.

But it is not by any means, it is said, intended to censure the present members of the church of England for alienations of rights that took place centuries ago; far less to insinuate that that respectable body have not an unquestionable right to the value of such a proportion of the produce of the soil, as will enable them to fill the stations in which they are placed with dignity and honour. The object which is here aimed at, is the giving a succinct account of the particulars and circumstances in which the payment of tithes in kind operates against the introduction of improvements in agriculture, and the advancement of religion; and by shewing the manner in which the alteration in the tithing system was effected in Scotland, to endeavour to point out a way in which the future payment of tithes in England may be arranged, so as to meet the purposes, and most effectually promote the interests of agriculture, without in the smallest degree infringing on the rights of the individuals concerned in paying or receiving them.

There are many different ways in which the payment of tithes in kind operates unfavourably to the general advancement and prosperity of the husbandry of this country. According to the writer of the Essays on rural affairs, it is universally considered as a grievance; there being, it is said, scarcely an agricultural survey of a county, in which it is not stated as an evil that ought to be removed. And this the author thinks no wonder, as the drawing of tithes in kind, when it is examined with attention, will be found to

operate directly, in the strictest sense of the word, as a tax on industry; and to be, at the same time, more vexatious in the mode of collecting than perhaps any tax that has ever been adopted, or had recourse to, on any occasion.

It is conceived to be a measure that has an injurious and unfavourable effect on four different descriptions of society, as the farmer, the landholder, the clergyman or improprator of the tithe, and the public.

As to the first, or the farmer, he is more or less affected, according to the differences of the nature, circumstances, and situation of the land which he may hold. The intelligent writer on Modern Agriculture, noticed above, considers it unfortunate, though certainly the case, that the payment of tithes in kind operates more against the spirited improver than against the slovenly and indolent; and that tithes, as the law now stands, cannot be considered so much the tenth of the natural produce of the soil, as a tenth of the capital employed by the farmer in its cultivation and improvement. For instance, if a farmer pays his ploughman ten pounds a year of wages, his labourer ten-pence a day for his labour, or the landlord a hundred pounds of rent, he must consider himself as advancing one-tenth part of these sums for the purpose of promoting the interest of the tithe-owner, who not only receives annually a sum equivalent to the tenth part of this capital, but that tenth improved to the highest degree which the unremitting exertion of the tenant is able to effect. Mr. Locke, it is continued, in his Treatise on Civil Government, remarks, that it is labour which puts the greatest part of the value upon land, without which it would scarcely be worth any thing. That it is to that we owe the greatest part of all its useful products; for all that the produce of an acre of wheat is more worth than the produce of an acre of as good land which lies waste, is the effect of labour. Hence, it is thought, the farmer furnishes a fund to purchase the necessary labour, whereby an acre of land is rendered so productive as to afford six, or eight, or ten shillings yearly of clear revenue to the tithe-owner, which, but for the application of that labour, would have remained unproductive for ever, in so far at least as he was concerned. So much is this the case, it is said, that if a farmer expends one hundred pounds on the purchase of manure, the improvement and cultivation of his farm, and the payment of the rent; and if the value of the crop, when sold, amounts to one hundred and ten pounds, he is actually a loser to the extent of five pounds, or what may be the interest of one hundred pounds for a year. He indeed gets his capital of one hundred pounds returned, but the tithe-owner draws the ten pounds, or rather more, or, which is the same thing, the value; so that the farmer has employed his capital to enable the tithe-owner to draw a dividend of 10 per cent. on that capital; whereas had he lent it on mortgage, or placed it in the funds, he would have benefited himself and his family to the extent of the interest or the dividend which he, in either of these cases, would have himself received. So much, it is said, for the absurdity of attempting to improve lands under such circumstances. The able writer of the above named Essays likewise, after stating different ways in which tithes operate against the tillage or corn-farmer, strongly remarks, that in this country, besides commons and wastes, much very fine land is allowed to remain in grass in a very unproductive state, which, with a very little or moderate degree of industry and outlay of money upon it, might be made to yield abundant crops of corn: and the reason assigned for this disgraceful state of management and want of production, which is so called, because, were it altered, even the grass-land might be easily made twice as productive

TITHES.

tive as it is by a judicious use of the plough, is, that the tithe of corn-land is so very heavy, as deters the farmer from having recourse to the plough: whereas in Scotland, where the corn-tithe is never drawn in kind, immense tracts of country, which thirty years ago were covered with heath, and totally unproductive even of grass itself, are now converted into fertile fields that yield abundant crops of corn and grass; and which, if the tithe-laws had there existed, must, in all probability, have continued unproductive until the end of time. This is a contrast that is very striking to every one, it is said, who travels through these parts of that country; and that it brings forward a practical fact, which ought, it is thought, to outweigh a million of speculative arguments.

The intelligent author of the Present State of Husbandry in Great Britain states, that another grievance to which farmers are subjected, in the payment of tithes in kind, arises from the harsh and oppressive manner in which the payments are sometimes exacted. The nature and extent of this grievance may, it is said, be learned by a perusal of the extract which is given below, from the same writer's Agricultural Report of the County of Northampton; where it is stated, that it has happened, (though, to the credit of the tithe-owners be it said, the instances are very few or rare,) where, when the tithes have been let for the purpose of oppression, the tithing-man has been known to exert that authority with which he was invested; that he has not only taken the tenth shock of corn, and the tenth cole of hay, but also the tenth lamb, pig, hen, egg, &c.; nay, has even gone into the garden, and taken not only the tenth part of the fruit, but likewise the tenth of the produce of the kitchen-garden. Under such circumstances as these, it may be asked, who is the farmer that would not feel himself aggrieved? From this it must appear, it is thought, obvious, that whether the farmer's interest or happiness be considered, it must be equally his desire that some arrangement should be effected, whereby the payment of tithes in kind should for ever be abolished; for, as the writer of the Agricultural Report of the County of Buckingham very justly, it is said, observes, it may be laid down as a proposition, that whatever profit arises to the cultivator of the soil, by the force of superior ingenuity and industry, should be held sacred by the church and government. If it be otherwise, it discourages the improvement of the soil; and thereby the church prevents the future increase of her tithes, and the government the future increase of its taxes.

It has been ably contended by the writer of the Essays on rural subjects, already noticed, that though the tithe-laws are hurtful to the farmer, they are perhaps still more so to the proprietor or land-holder. Whatever checks, it is said, the industry of the farmer, must, in a direct manner, diminish the income of the landlord; and as the energy of a farmer, when once excited, is well known to augment in proportion to the advances he has made, whatever checks that energy in the bud, occasions in time a diminution of income to the proprietor, much greater than can be easily conceived. And that, as it is supposed the proportion of rent which can be afforded for arable land, increases with the productiveness of that land in a much higher degree than in the ratio of the quantum of the crop; whatever tends to render land permanently more productive than before, if no deduction be made from it, tends, at the same time, to augment the income of the proprietor in a still higher degree than that of its produce. But as it is obvious that the tithe operates as a dead bar to the commencement of improvements in agriculture upon any soil of no great degree of fertility, so as to prevent the beginning of that motion, from the acceleration of

which alone the proprietor can hope to derive considerable increase of rent; in all cases his rent is diminished in a much higher ratio than one-tenth, as it might seem to do by those who take only a slight view of the matter. It is added, that should the proprietor of poor lands, seeing the impossibility of the tenant's improving them, attempt to render these more permanently fertile by the outlay of stock upon them, that he never expected to draw back; but would content himself with a reasonable return of interest on the capital in the name of rent, he would not find the case much altered. He sets out, it may be supposed, with this principle, that if he can secure a permanent rent, equal to 5 per cent. on the money expended upon them, he will be very well satisfied with it. Let us say, then, that twelve bushels of grain were the neat expence of culture, &c. which, on an average of all sorts of corn, was valued at 4s. the bushel; and that he had expended 20l. the acre, the interest of which, at 5 per cent., is 20s. or in other words, five bushels. But that before he can draw this rent free of tithe, the average produce must be, at least, eighteen bushels, out of which must be taken one bushel and nine-tenths, so that instead of five, his rent will be reduced to 3 per cent. nearly; while the tithe-owner will be entitled to draw nearly 2 per cent. for ever, on the capital which the improver had thus expended. It is almost needless to add, it is said, that under such circumstances it is vain to look for a general spirit of agriculture, either among proprietors or tenants, to both of which descriptions of persons the operation of the tithe-laws are, it is contended, highly oppressive.

And another instance is stated of very material importance, in which tithe becomes singularly pernicious and prejudicial to proprietors of land. The importance of keeping and preserving the whole produce of the ground upon the farm where it was raised, for the purpose of making manure, seems, it is said, to be very generally understood; as a clause to that effect is universally found inserted in the leases in every county of England, wherever leases are granted at all. What punishment, it is asked, would the proprietors of these lands deem adequate to the crime of selling off the whole produce of the farm every tenth year? Yet great as this crime would be, it would not be adequate, in point of damage to them, to the right of drawing tithe in kind from their arable lands; because the farmer who sold the produce would, at least, become possessed of money to replace, in some degree, by means of extraneous manures, the loss he had incurred by the abstraction of the home-dung. Those who are entitled to draw the tithe in kind are, in fact, by this means, vested with a power of enriching themselves, or their own private property, if they be so inclined, at the expence of every other proprietor around them. In this point of view, therefore, tithes are singularly pernicious to proprietors of land. This is unquestionably an objection to the drawing of tithes in kind that can probably never be well got over by any of those who are so favourable to the present tithing system. It strikes at the very vitals of all our improvements in husbandry and rural business.

Besides, the writer of the work on modern husbandry considers that inasmuch as the spirit of improvement is depressed and checked, the land-holder must be injured; and that as there are no regulations or laws existing in this country which have such a tendency to impede the introduction of new or improved modes of husbandry as those of exacting the payment of tithes in kind, there are, of course, none that operate so decidedly against the landed interest of the kingdom. If, it is said, the farmer be restrained from inclosing, draining, purchasing manure, in short, from cultivating

TITHES.

sivating and improving his land to the highest degree, who will deny that the interest of the owner is affected? And that this is the case in a variety of instances, from the operation of the tithe-laws, is admitted by every one who is perfectly acquainted with the present state of agriculture in this country.

In respect to the impropiators of tithes, it may be noticed that, if the interests of religion and the clergy be considered, it will be found that the system of taking the tithes in kind is equally productive of bad consequences. It will be discovered to disturb the harmony of society, and to be often the means of creating such disputes and divisions between the clergyman and his parishioners, as renders the religious instructions of the former of little avail. Among the many instances which might be mentioned of the tearing and vexatious circumstances of this nature that occur to unhinge the harmony which ought to subsist between the clergyman and his parishioners, that which is given below, from the Agricultural Report of the County of Hants, may be sufficient. In this case the clergyman and the farmer were at variance; and the farmer, determined to be even with the clergyman, gave him notice that he was going to draw a field of turnips on a certain day. The clergyman accordingly sent his team and servant at the time appointed, when the farmer drew ten turnips, and desired the other to take one of them; saying he should not draw any more that day, but would let him know when he did. This fully shews the vexatiousness of the practice of tithing in this manner.

Further, that in a political point of view it is also injurious, as tending to loosen that chain of intercourse and connection which, it is conceived, is of so much importance to keep united. The interest of the clergy would likewise be greatly promoted, were they to receive an equitable compensation for their tithes, in place of drawing them in kind, or of making annual arrangements with the farmers.

But it is the lay proprietors, it is said, that are the most blameable in respect to the rigorous manner in which the tithes are collected. It is said that clergymen, who act up to the character in which they stand in the scale of society, (and the most violent declaimer against them will not pretend that a very great majority of that respectable body do not so act,) very generally sacrifice so great a portion of their just demands for the sake of peace and quiet, that, if the expence of collecting be added, there is scarcely any composition that can be proposed which it would not be for their interest to accept. Some instances there no doubt are, where the clergyman, being of a turbulent, avaricious disposition, lays hold of every advantage, and collects his tithes to the value of the uttermost farthing: but it ought to be remembered, that a clergyman who does so, nay, that a clergyman who submits to the drudgery of collecting tithes in kind, must lose, in the opinion of the parishioners, a great share of that respectability of character, which it is his indispensable duty to support and keep up.

And in relation to the public, the effect which this injudicious regulation has, is equally prejudicial and mischievous. It comes in, according to the author of *Modern Agriculture*, for its share of the loss arising from the effect which the tithe-laws have on the husbandry of the country, as, by their operation, the quantity of corn that might be cultivated, did not such laws exist, is diminished to an immense degree, and other branches of the art of farming are greatly impeded. Besides, they check industry, by depressing the farmer's spirit, and by preventing the circulation of money that would be expended in improvements, and in the pur-

chase of the manufactures of the country. Were no such laws in force, the proprietors and farmers, in consequence of the success of the improvements which in that event would be undertaken, would be enabled to purchase more of the manufactures of the country, pay a greater share of the taxes for the support of the state, and after all, live in a greater state of ease and comfort, than under the existing circumstances they are able to do. In short, it is considered that the abolition of these laws is the only measure that can be adopted with any probability of success, at least the first one that ought to be attended to, with a view of again bringing the corn-trade to turn once more in favour of this country. When all these various circumstances are conjoined; and when it is further considered that, except in Spain and Portugal, there is scarcely a civilized nation in the world where this system of church-slavery is allowed to exist; and that even in Russia tithes are abolished; it may be reasonably hoped that the period is not far distant when England will be relieved by legal and constitutional means, and in consequence of arrangements made on liberal principles, from this almost Egyptian bondage.

It further likewise appears, from the accounts given by different writers on the subject of tithes, that they were paid in the latter end and ages of the Romish church with great reluctance; and even in this country during the reign of Henry VIII. Therefore it is said, that if, when improvements in agriculture were in their infancy, and at a period too when men's minds were held in slavish servitude by the clergy, the payment of tithes in kind could hardly be enforced, can it be supposed wonderful, that in these enlightened days it should be considered as a grievance? At a period when the principles of religion and of real genuine liberty are better ascertained, and more generally known, than in any former age, it is not surprising that laws compelling the payment of tithes in kind, laws which originated in edicts issued by bigotted kings under the influence of designing priests, should now be found inimical to the best interests of the country, and to the happiness of so many thousands. That this is the case, every inhabitant of this island has ample opportunities of satisfying himself by a perusal of the agricultural reports of the different counties of England and Wales, which have been lately published. And that as these reports, after having been circulated among the proprietors of land and farmers for their correction and amendment, still contain, in their republication, the same or similar complaints in respect to the hardships which the farmers are subjected to, and the injury which agriculture sustains, by the continuance of the payment of tithes in kind, such complaints may justly be deemed the voice of the people proclaimed in a constitutional way; and as such, merit the most serious and speedy attention of the legislature and of the clergy.

A few of the injurious effects of the practice of paying tithes in kind have been noticed above, and many more of the hardships proceeding from it are recorded in the different agricultural county surveys and other works which have been only slightly touched upon in what has been already said upon the subject. And the necessity of something effectual being done, in order to the removal of so inconvenient and oppressive a regulation, has been strongly shewn in the writings of the various advocates of the improvements of British husbandry and farming, as well as by many other able and intelligent writers on matters connected with them; but which, for want of room, cannot be considered here.

As, therefore, some reform in the mode of paying tithes in this country must be admitted to be indispensably necessary,

TITHES.

fary, it is to be wished that the legislature, especially at the present time, would devote that attention and consideration to the subject which its importance and necessity demand, and the clergy come forward with such reasonable propositions for the adjustment of the business as may be suitable, as by such means the matter might, and no doubt would, be soon easily settled to the satisfaction of all the parties concerned.

In the view of affording a proper knowledge of the most suitable means of effecting so important an alteration, the author of the "Present State of Husbandry" in this island, gives the following clear account of the beneficial arrangement which took place in respect to tithes in Scotland, and of the circumstances which led to it. It is stated, on the authority of Erskine's "Institutes of the Law of Scotland," that the payment of tithes in kind was continued for many ages in that kingdom; and that, owing to the precariousness of the climate, it was attended with more grievous hardships than could have taken place in the southern part of the island. Every Scotch proprietor or farmer, who presumed, after reaping their corns, to carry off any part of them from the field, until the person having right to the tithe had drawn his share, were, from the first establishment of this right, subject to severe penalties. The tithe-owner, on the contrary, either from indolence, a desire to oppress, or with a view of compelling the proprietor or farmer to purchase his tithes annually at a high price, frequently delayed drawing his share until a great part of the crop or produce was rotten. Notwithstanding several statutes were enacted with a view of checking the oppressive disposition which so often evinced itself in the conduct of the clergy in this respect, yet these grievances continued to exist, more or less, until the year 1633; when a decree-arbitral, passed by Charles I. in 1629, for arranging and determining a mode, to be afterwards adopted, for the payment of tithes, was ratified by parliament.

That during the struggle for the establishment of this or that form of church-government, great alterations had taken place, both in regard to those having right to the tithes, and to the manner in which they were exacted. On the Reformation, the benefices of the church fell to the crown, and were, at different periods, gifted for services, or other considerations; such as for supporting universities, hospitals, &c.; and the persons obtaining them were denominated lords of erection, and sometimes called by other names. They likewise got, or assumed, the right of nominating officiating clergy on all vacancies. These alienations were, by act of parliament, 1587, put a stop to; and such tithes as had not been previously disposed of, remained with the crown unalienably. The tithes, which were then annexed to the crown, may be valued and leased by the proprietor of the lands, but cannot be purchased. The officers of the crown are in use to grant leases of this description of tithes for nineteen years, and which are renewed as matters of course on paying a reasonable sum on such renewal. The sum demanded is regulated by the yearly value of the tithes; so that a capital equal to between five and six years' amount of the tithes, laid out at the commencement of the lease, and improved by compound interest, is sufficient to produce such a sum at the expiry as will obtain renewals to perpetuity.

Some of the clergy remained, it is said, in possession of their benefices after the Reformation; and the vacancies that happened in such benefices were filled up by those who assumed the right of presentation. An act of parliament was soon afterwards passed, whereby the patrons were deprived of the right of patronage: but in compensation

for this supposed hardship, it was enacted, that the right of all tithes, so possessed by the clergy, should be vested in those who had exercised the right of patronage. Patrons having acquired tithes in this way, are compelled by law to sell them at nine years' purchase of the yearly value of the tithes.

The system of tithes and tithing having, however, got into great confusion, in consequence of the various alterations that took place in the government of the church of Scotland, those interested found it necessary to submit their several rights and claims to the determination and final award of Charles I., who, on the 2d of September, 1629, pronounced two decrees-arbitral, or judgments, which laid the foundation of that arrangement respecting tithes, and the payment of the established clergy in Scotland, which has been productive of so many good consequences.

The most important article in these two decrees-arbitral, is that which directs the valuation and sale of tithes; after which, the land-holder is entitled to the whole crop upon payment to the proprietor of the tithes of a yearly rent, or to purchase them at an easy rate, subject to a reasonable provision to the clergy. The words of this famous decree are, it is said, that "the rule of all tithes, where they are valued jointly with the stock, shall be a fifth part of the constant yearly rent that is paid for the lands." Another material circumstance in the valuation of tithes in Scotland is, that the rents of mills, those arising from recent improvements, and some others of less importance, are deducted from the gross amount.

By these decrees, which were ratified in parliament in 1633, the proprietors of land not having right to the tithes, were not only found entitled to sue the titular in an action at law to ascertain their value, but, unless vested in the crown, to obtain a purchase of them on established terms, as mentioned above. Thus, ever since 1633, every landholder in Scotland has had it in his power to acquire right to his own tithes, either by purchase, or lease, so that they should be no longer payable in kind. Nevertheless, those who neglect to sue for a valuation may still be subjected to all the inconveniences of the former law; as under such circumstances, those having right to the tithes may draw them in the manner commonly practised in England. The remedy is, however, so easy, that he must be a fool indeed who would subject himself or his tenants to such a slavish servitude, while he has it in his power, by a simple application to the supreme court of the country, to abolish it for ever.

Some instances are, however, recollected, where proprietors in the north of Scotland, having a right to the tithes, and being unwilling to forego all the power of harassing their tenants, which attached itself to the ancient feudal barons, still continued to draw the tithes for some time. But they at last became ashamed of such conduct; and there is not now, it is said, one instance where tithes are paid in kind, or where the tenants have any concern, either directly or indirectly, with or in the payment of tithes on the north side of the Tweed. How then, it may be asked, are the Scotch clergy provided for? The answer is, it is said, easy; the stipends provided by law for the maintenance of the Scotch clergy are still payable out of the tithes. The judges of the court of sessions, who act as commissioners for the arrangement of tithes, have a right to modify reasonable stipends to the parochial clergy. And accordingly, in all such cases, where the clergyman can shew that the parish is a place of more than ordinary resort, that the cure is burdensome, or that the necessaries of life give a high price in that part of the country, or that the scanty

TITHES.

scanty allowance of stipend in that parish bears too small a proportion to the weight of the charge, provided there are free and unappropriated tithes in the parish, the commissioners, on the application of the clergyman, grant an additional stipend, either in money, but more generally, where practicable, in grain, as being less fluctuating in value than money. But that owing to the free tithe in the parish having been previously assigned to the clergyman, some instances do occur, where the commissioners have it not in their power to augment his stipend, although it be too small for the decent maintenance of a numerous family. In all such cases it would, it is thought, be highly proper to apply part of the bishop's tithes, such as are now payable to the crown, to the purpose of rendering the situation of these clergymen, who are so unfortunately situated, more decent and respectable.

In order to the introduction of a suitable arrangement in regard to tithes in this part of the country, it is remarked, that the question has been for some time past very popular, and much agitated; and that many difficulties have been started, apparently for the purpose of rendering it more perplexed and complicated than it is in reality. Holding it as a sacred and inviolable principle, that tithes, as now payable in England, were formerly appropriated for particular purposes, and that although in many instances alienations were made at different periods; yet that as these are expressly or virtually confirmed by those laws which protect national and individual property; therefore tithes, as now payable in the southern part of the island, are payable in conformity to the laws of the country. This being granted, no man who has a regard for justice, who venerates the constitution, or who would not wish to see the rights of property invaded, but must be satisfied, that if the present mode of paying tithes is abolished, the clergy and the lay-proprietors of tithes are, in law, justice, and equity, entitled to an equivalent. What that equivalent ought to be, and in what manner ascertained, becomes the question. It is observed, that it is not by appeals to quarter-sessions, nor by special acts of parliament for this or that particular diocese or parish, that this great national question can be determined with propriety: it is only by a submission of all rights and claims of both parties to the determination of some one respectable individual, that the matter can be amicably or equitably decided. And it is thought, that the most proper individual to be made choice of is the sovereign, or person holding the government of the country.

The clergy, it is said, need not be afraid to appeal to such an arbiter, as in the course of a great length of time there has been no instance of any degree of infringement of or upon their rights. The land-holders and lay tithe-owners may keep their minds at ease, as though the most sacred regard for religion has been evinced, yet it has been divested of superstition or bigotry. If, it is continued, Charles I. during the anarchy of church-government that prevailed in his time, found no difficulty in passing a decree in a similar case, which, having received the sanction of parliament as a matter of course, laid the foundation for a just and equitable arrangement of the tithes, the business may unquestionably be accomplished with much less difficulty at the present period. The probable consequences of such a submission would, it is thought, be, that the arbiter would no doubt appoint commissioners to examine and ascertain the yearly value of all the landed property in England, the produce of which is subject to the payment of tithes. Were the yearly value of the lands ascertained by a corn-rent in place of one in money, and which, it is supposed, might be easily done by taking the average price

of corn for the seven or ten years or more last past, with the exception, however, of 1795, and some other scarce and dear years, the clergy could sustain no loss, nor would after valuations in consequence of the depreciation in the value of money, be rendered necessary.

This being done, a fifth, a sixth, or any other given proportion of the free rent, after the payment of parliamentary taxes affecting land, would be declared due to the tithe-owner in lieu of the payment of tithes in kind. One clause of the decree would probably, it is thought, be, to compel every lay-owner of tithes to sell his right to the land-holder, at a fair and equitable, but regulated price; and another would most likely be, declaring the clergy entitled for ever to a fifth or sixth, or some other determinate proportion of the present real free rent of all titheable lands, to which they may have right, and subjecting the proprietors to the regular payment thereof. Thus at once would, it is said, a load which has for many ages pressed down the spirit of the English farmers, be removed, and that while all ranks and degrees must applaud the equity and the propriety of the arrangement, a spirit for agricultural improvements would evince itself superior, it is thought, to any of which the records of this country make mention.

It is supposed that this mode is the less exceptionable, as it is almost similar to that adopted when acts of parliament are passed for enclosing particular parishes. At the first meeting of the commissioners named in such acts, they direct, that all having interest may deliver in their claims, and the rights or grounds on which they claim, against a certain day. Those being afterwards examined by the commissioners, who are neither more nor less than arbiters appointed by the legislature, their decision constitutes the law in regard to the right by which the individual proprietors hold the lands, which by the arbiter's award is assigned to them. In place, therefore, of multiplying acts of parliament respecting the adjustment of tithes *ad infinitum*, one only, and that a very short one, seems necessary, authorizing the governing person to arbitrate between the owners of the tithes and the land-holders; and whose award, like that of the commissioners appointed under acts of parliament for enclosures, should be final, and have the effect of law. Having thus laid down the general principle, it will not be expected that any attempt will be made to combat the little difficulties that may be started against the practicability of carrying the measures founded thereon into effect. These the wisdom of the arbitrator will be fully sufficient to obviate and direct. One thing is certain, it is supposed, namely, that a decree-arbitral or judgment, pronounced by such high authority, and founded on these principles, would give universal satisfaction to every party concerned.

On a matter which is so very interesting and important to the English land-holder and farmer, it will be necessary and useful to bring to the inquirer's notice and attention a few of the different other modes and plans which have been suggested at different times by different writers for effecting the business and adjustment of the matter of tithes.

The intelligent writer of the Essays on rural affairs has supposed, that the tithes of or in England and Wales should be converted, so as to make a payment in money be universally received in lieu of the payments in kind that are at present exigible; but under such modifications as to prevent the possibility of those who are entitled to draw the tithes from suffering by the depreciation in the value of money, which we have seen for a long time past has been going on in a regular progression; and which may be expected to continue; or may, perhaps, as at this time in a neighbouring country, be sunk almost to nothing by some political shock

that

TITHES.

that cannot at present be foreseen. With these views, might not, it is asked, a law be obtained, authorizing the valuation of tithes, in every case where either of the parties interested in it should so incline? This might be done, it is said, by a summons raised against all the parties concerned, either before the sheriff of the county where the property lay, or before any other judge that should be thought more proper for executing the office; who, after hearing the parties, should proceed to make a legal inquest to obtain a clear proof what had been the amount of the tithes, actually paid and drawn, for five, ten, fifteen, or twenty years last past, as should be judged the most proper, out of the several lands in question; specifying distinctly the quantity of each denomination of grain, or other titheable produce. But as it may easily be foreseen, that it would be a matter of great difficulty, in many cases, to get at these facts with precision, might it not be put in the power of the judge, if the parties could not agree as to that particular, to appoint two or more persons of good character in the neighbourhood, to gather up the tithes in kind themselves, fairly and honestly, for five years next to come, without favour to any person; the amount to be delivered to the persons having a right to receive them, after the quantities had been respectively ascertained, so as to admit of the collectors making up an account of the whole, upon oath, to be delivered to the judge; who, from that account so made up, should cause an average to be struck of the quantities of each particular article; which average quantities, after deducting a just proportion for the expence of collecting, and taxes affecting the tithe, should be declared by him to be the legal tithe exigible from the land in question in all time to come? But as there is room to suspect that the money prices of corn, wool, &c. of different denominations, may rise to be much higher in some future period than it was at that time; instead of then ascertaining the price of these articles, let it be declared, that the quantities of grain and other articles resulting from the averages respectively, are payable out of the respective lands, leaving the average prices of such grain, &c. to be settled and ascertained each year, as is specified below; declaring that the money which shall arise from the average prices thus ascertained, should be in lieu of the whole tithe that could be exacted each year; the time of payment too to be specified. And, in order to prevent all disputes as to the average prices of these articles in time to come, let the sheriff of each county be authorized and required to make an inquest at a certain period each year of what has been the actual ready money selling price of corn of the preceding year's crop, from the time the crops were reaped till this time, and of wool, as well as of all other titheable articles for the former year, by examining witnesses before a jury to be appointed for that purpose, which prices, after being thus ascertained, should be published and declared to be those by which the quantity of tithe-corn of each particular description, and other titheable articles, contained in any degree of valuation, should be payable for the crop of the preceding year. Thus, it is said, would the tithe-owner be entitled to receive payment of his tithes, without any extraordinary expence or trouble, or unjust deduction or dispute whatever: the farmer would be allowed to carry on his operations uncramped by those galling restraints which the tithe-laws at present perpetually throw in his way: the proprietor would be at liberty to apply such part of his capital as he might incline, towards promoting agricultural improvements, with a reasonable prospect of being benefited by his exertion: and the public would become possessed of a quantity of surplus produce of land, which it can have no prospect of ever otherwise en-

joying, which would be the means of diffusing a perpetual plenty through every corner of the land.

Mr. Pitt too, in his account of the agriculture of a midland district, suggests, that the mode or scheme to be adopted as the outline of an exchange of tithes, should be for land, in the manner directed below, as land will always bear a value proportionate to that of its produce, and that even the price or value of labour is measured by the same standard. This is, that an act of parliament should appoint, in every diocese, an equal number of the most respectable clergy and country gentlemen commissioners and trustees, with a power of nominating surveyors, to value all the tithes belonging either to the clergy or laity within the diocese; and that this act should be let give an option to the land-owners of purchasing their respective tithes, at the valuation fixed on them by such commissioners and surveyors; the money arising from such redemption being invested in the funds, or other more proper securities, until a suitable opportunity should offer of laying it out in the purchase of land; and that, where the land-owners should refuse to purchase such tithes, the commissioners should have the power of mortgaging them, or of taking up money on their security, to be invested in the same way with that arising from the tithes actually sold; or after a given time, the trustees might be empowered to set apart an allotment of the land of those owners who refuse to purchase, and which, if conveniently situated for the former tithe-owner, might be so applied, otherwise sold; and the money arising from such sale invested as before, until it could be laid out in the purchase of land. The execution of some such plan or mode as this, would, it is supposed, be attended with infinitely less trouble and expence than now incurred by the annual valuation of tithes; as, should such a regulation be once effected, the business would be settled for ever: while under the present system, the surveyor or valuer's business is never done, but continued from year to year; and, if it should remain, will be from generation to generation. An equivalent in land must certainly, it is thought, be a more solid property than tithes. Land too may be improved in any degree by good management and industry: tithes fluctuate or sink in value at the will of the cultivator. Some such commutation as this may, it is thought, be readily and easily effected, and that all parties would be pleased with the alteration.

The concluding remarks and suggestions on this greatly interesting matter, are the result of the investigations and enquiries of two clergymen, who have been lately engaged in drawing up accounts of the state of the agriculture of two large counties of the kingdom; those of Hereford and Berks. The former states, that of the various modes proposed to effect the desirable object of a general commutation of tithes, that of a corn-rent seems to have met less objection than most others which have been yet proposed; still, however, nothing has been seriously attempted, and the matter remains open to further discussion. It has not, perhaps, it is said, occurred to every one, that tithes, in their present form, have a direct and powerful tendency towards increasing the prices of wheat and of every other grain, by creating obstacles to its culture, and thus diminishing the quantity which would otherwise be grown. But that the single fact, that an acre of land under the culture of wheat, is liable to a deduction on account of tithes, in nearly a ten-fold proportion to that of an acre of land grazed by cattle or sheep, is surely sufficient evidence that tithes must operate unfavourably to the culture of grain, and consequently to its abundance and cheapness. How desirable then is, it is said, such a commutation as would render this payment equally heavy on every acre of land, according to its value, whether

TITHES.

it be applied to the culture of grain, or to the production of animal food. Under this impression it is here proposed, that in lieu of tithe, a tax be imposed, on the principle of an equal land-tax, upon every estate, according to its value, for the support of the clergy. The wisdom of parliament would, it is supposed, easily determine how many shillings in every pound of rent would be equal to the revenues to which the clergy have a claim, and that the measure would be greatly facilitated by the investigations occasioned by the income or property act lately in force. The tenant might be made liable in the first instance to the payment of the duty proposed as a substitute for the tithe, but in case of his default, the landlord might be made ultimately responsible.

In this mode of arrangement, the clergy, it is supposed, would receive what is their due, a full equivalent for tithes in its present state; the security would still attach to the soil itself, and their revenues would still increase with the increase of the value of land and its produce. Encouragement would thus be afforded to increase the culture of grain; the industrious farmer would not have to contribute more than is just proportion; the tithe-owners too would obtain the fair value of their property; the clergy of the church of England would acquire that degree of respect and esteem to which few will deny that they are, in the aggregate, entitled; and, above all, they would be enabled to fulfil the valuable purpose of their institution: while at present, the clergyman who demands but the fair value of his property, becomes hated, and often insulted; and, to use the strong language of some, his "integrity becomes suspected; his every action is seen through a false medium; and the pastor is lost in the collector of tithes!" If it should be objected, that under this or any other mode of commutation, the farmer would not eventually be benefited, because the landlord would then receive what is now paid to the tithe-owner; and that the farmer has no just ground of complaint, as he engaged his farm subject to the deduction or payment of tithes: let it be understood that the interest of the community at large, not of any one branch of it, is here contended for.

The writer maintains, that the great object of a commutation of tithes, beyond a religious view of it, is the relief of the corn-field, and not the farmer. Perhaps, it is said, if the subject be well considered, the farmer would gain less in a commutation than any one class of society. Tithes, in their present form, may check his improvements, may contract his system of farming and his capital, may harass his mind, and lead to personal animosities and expensive litigations; but probably his mere payments in lieu of tithe would, on the whole, be as heavy under any commutation, as those to which he is now liable. The public, it is said, must give that price for grain, at which it will answer the farmer to raise it; and that supposing it possible that the farmers throughout the island were to engage in a combination, to convert so much of their present tillage into pasture, as would leave only half the usual number of acres under corn, the inevitable consequence would be, that grain would sell at an enormous price, and the farmer would receive that increased price, at a time when his expenses were diminished in the proportion of his tillage. Thus the consumer, which is the public, and not the farmer, would suffer; and if a tax, such as tithes, added to the increased price of timber, iron-work, and labour, should induce the farmer gradually but materially to contract his tillage, there could be no hope that grain would be sold during any considerable period at a moderate price; nor could there be an adequate supply for the wants of the country, without the

aid of large importations, which are always precarious, and sometimes impossible: and as animal food invariably rises in value with the increased value of grain, the farmer might thus be enriched at the expence of every other branch of the community. The plan or mode here proposed for a commutation would, it is presumed, counteract or prevent these serious evils; encouragement would be given to an extended culture of grain; and a new motive to industry and exertion would be found in the consideration, that the most indolent farmer must contribute an equal sum with the most active and successful cultivator.

The latter of these clergymen thinks, that in regard to tithes in secular hands, though the church may suffer in the amount of its income, it derives a considerable degree of security for what it still possesses, from this very circumstance; and consequently only touches on the subject so far as to propose that they should be commuted for land, according to their value. To this no reasonable objection is seen, or any insuperable difficulty, if a legislative plan were once chalked out for its accomplishment. But as for tithes in the hands of the clergy, whether great or small, it is supposed they might be beneficially commuted, by first taking their fair valuation by two competent sworn commissioners, one of whom should be named by the incumbent, and thus fixing a sum to be paid according to the combined prices of *corn*, *meat*, as mutton and beef, and *malt*, to be taken on the average of the seven preceding years, and to vary with the times every subsequent seven years. And in order to prevent any thing personal between the incumbent and his parishioners, except in the duties of his vocation, the overseers and churchwardens to be made the responsible agents in collecting and paying the sum to be raised, with certain provisos and securities against misapplication and loss. A corn-rent alone is, it is said, found to be an inadequate mode of commutation; but that taking the three great articles of life in every family, *bread*, *meat*, and *malt*, the clergyman would be secure from injury, and the farmer, paying only in proportion to the value of his produce, would have no reason to complain. It is to be observed, however, that it is wished for the laws to act uniformly for the benefit and security of the parochial minister, without subjecting him to the necessity of coming forward in a personal and partial light. By these means, what he might lose in the influence of fear, would, it is thought, be amply compensated for on the principle of love; without which he can seldom be happy himself, or discharge the duties of his sacred office with effect and satisfaction.

Where lands have been exonerated from tithes by an act of parliament, and an allotment made in land in lieu of them, even where an adequate value has been given, which in no instance that has fallen under the writer's notice is, it is said, really the case, it is throwing too much land into mortmain, it is subjecting the incumbent to all the cares and incumbrances of landed property, and driving him to the necessity of becoming a farmer, for which he is often ill qualified, or of letting lands, according to the existing laws, on such conditions, that improvement must be checked, and industry languish.

In order, however, to obviate some of the evils resulting from a practice that has already, it is said, become too general, it is proposed, that after having reserved a sufficient glebe, which in every instance should be done, with a due regard to the value of the living, the incumbent should be allowed to lease the remainder, at the full value, with the consent of the patron and the bishop, on a running lease, determinable every three or seven years, at the option of either of the two principal contracting parties. A new incumbent

cumbent would thus, it is supposed, without waiting too long, have an opportunity of improving his property, if he thought it capable of being so; and the tenant, having a fair prospect of occupying the land under any change, would feel himself equally safe in making improvements, as if he rented of a layman. All dilapidations and repairs on the farm, however, should fall on the tenant; who ought not only to be bound in proper covenants, but be obliged to give due security for their performance, as well as the payment of the rent.

Or, to land belonging to the clergy, the *corn, meat, and malt* rents might, it is said, be applied as well as to tithes with leases for twenty-one years certain, which would probably be the most eligible mode, as it would give uniformity to the plan of clerical provision, and would always afford an income according to the times.

Upon the whole consideration of the subject, there cannot be any doubt but that great advantage and improvement would arise to agriculture, from some measure of this nature being had recourse to and carried into execution; and though the farmer might not perhaps, on the whole, experience any great diminution in the quantity of money which he would have to pay, he would be wholly freed from the anxiety, trouble, and vexation, which constantly attend the taking of tithes in kind, and at the same time, which is much more important and material, be left at full liberty to exert his utmost endeavours to promote all kinds of improvements, which the nature of his farm may with propriety admit. And in this way, and by such means, the art of agriculture would be carried forward to such a state of improvement and perfection as cannot be easily conceived. Besides, such a measure might have a considerable effect in promoting the inclosure and cultivation of much land still in the disgraceful situation of waste, all which are desirable objects on various accounts in the present state of the country.

TITHE-Rate. See **RATE-Tithe.**

TITHES, Subtraction of. See **SUBTRACTION.**

TITHING, DECENNA, or Decury, a number or company of ten men, with their families, knit together in a kind of society, and all bound to the king, for the peaceable behaviour of each other.

Anciently no man was suffered to abide in England above forty days, unless he were enrolled in some tithing.—One of the principal inhabitants of the tithing is annually appointed to preside over the rest, being called the *tithing-man*, the head-borough, and in some countries the borsholder, or borough's elder, being supposed the discreetest man in the borough, town, or tithing. The distribution of England into tithings and hundreds is owing to king Alfred. See **DECINERS, FRANK-Pledge, and FRIBURGH.**

TITHONIA, in Botany, was so named by professor Desfontaines, in allusion to the glowing light-orange tint of its flowers, which the French call *couleur aurore*. The fabled favourite of Aurora, Tithonus, is therefore here meant to be commemorated. The allusion would have been still more happy, had the flower been one of the everlasting kind.—Desfont. Ann. du Mus. v. 1. 49. Willd. Sp. Pl. v. 3. 2246. Juss. 189. Lamarck Illustr. t. 708. Poir. in Lam. Dict. v. 7. 690.—Class and order, *Syngenesia Polygamia-frustranea*. Nat. Ord. *Compositæ oppositifoliae*, Linn. *Corymbiferae*, Juss.

Gen. Ch. *Common Calyx* cylindrical, of a double row of ovate-oblong, acute, flat, nearly equal, erect scales. *Cor.* compound, radiated. Florets of the disk numerous, all perfect, level-topped, tubular; limb five-toothed; tube inflated near the base. Those of the radius female but abor-

tive, about twelve; limb elliptic-lanceolate, acute, entire, horizontal, flat. *Stam.* in the disk only, Filaments five, capillary, shorter than the tube; anthers united into a cylinder of the same length. *Pistl.* in the disk, Germen oblong, slender; style thread-shaped, the length of the partial corolla; stigmas two, recurved, obtuse; in the radius, germen very small; style scarcely any. *Peric.* none, except the unchanged calyx. *Seeds* in the florets of the disk only, solitary, ovate, smooth; their crown of five short, acute, erect, membranous scales. *Recept.* convex, chaffy, its scales concave, acute, rather taller than the seeds.

Eff. Ch. Receptacle chaffy, convex. Seed-crown of five chaffy scales. Calyx cylindrical; its scales equal, converging, in two rows. Florets of the disk inflated at the base; those of the radius elliptic-lanceolate.

1. *T. tagetiflora.* Marigold Tithonia. Desfont. as above, t. 4. Willd. n. 1.—Native of Vera Cruz. *Root* annual. *Stem* erect, alternately branched, leafy, a foot high. *Leaves* alternate, on long stalks, downy, crenate, reticulated with veins, triple-ribbed; the lower ones deeply three-lobed; upper undivided, ovate, or somewhat heart-shaped, acute. *Flowers* on long solitary stalks, at the end of each branch, orange-coloured, about the size of a French marigold.

TITHOREA, in Ancient Geography, a town of Greece, in the Phocide, on mount Parnassus, 80 stadia from Delphi. This place was famous for its sacred grove dedicated to Minerva, a temple with the statue of this goddess, and the tomb of Antiopé and Phocus. The temple of Esculapius Archagetes was situated 70 stadia from Tithorea. The inclosure which contained the chapel of Isis was 40 stadia farther distant than the temple of Esculapius.

TITHRASUS, a town of Africa, in Libya, bordered by a river of the same name.

TITHRONIUM, a town of Greece, in the Phocide, in which was a grove sacred to Apollo, with some altars and a temple, but without a statue. This town was situated 15 stadia from Amphicea and 20 from Drymea, near the river Cephissus. Pausanias.

TITHYMALOIDES, in Botany, so called from its affinity to *Tithymalus*, the *Euphorbia* of modern botanists, differs from that indeed merely in having the calyx gibbous on one side at the base.—Tourn. Inst. 654.—Two or three West Indian species of *Euphorbia* come under this description.

TITHYMALUS, τιβυμαλος of Dioscorides, supposed to be derived from *τιθος*, *the breast*, in allusion to the milkiness of the plant. Tourn. t. 18. See **EUPHORBIA.**

TITI, SANTI DI, in Biography, was born at Citta S. Sepolero, in the Florentine state, in 1538. He first acquired a knowledge of painting under the tuition of A. Bronzino, and afterwards of Bandinelli, but owes the greater part of his fame to his studies at Rome, where he long resided, and from whence, as Lanzi observes, he carried back to his native country a graceful and scientific style of art, not supported by much ideal beauty, but chiefly characterized by the truth and freshness of nature; and in expression he had few superiors in any school, none in his own. He adorned his pictures with pieces of architecture, which science he in a measure professed, and by its means gave great relief to his figures, and increased the dignity and beauty of his compositions. His principal works are, the Supper at Emmaus, painted for the church of St. Croce, at Florence; the Resurrection of Lazarus, in the Duomo di Volterra; and the Descent of the Holy Spirit, painted for a convent at Citta di Castello. He died at Florence in 1603, aged 65, leaving a son, *Tiberio Titi*, born at Florence in 1578, who followed the same art with his father, but not with equal success. In

general he painted small portraits very skilfully, and made drawings in black-lead; of which there is a large collection in the Florentine gallery, made originally for the cardinal Leopold de Medici. He died in 1637.

TITIAN, the name by which we are acquainted with that great master, who is universally regarded as the head of the Venetian school of painting, Tiziano Vecelli da Cadore. This justly distinguished artist was born of noble parents at the castle of Cadore, in Friuli, in 1480, according to Vafari and Sandrart; though Ridolfi, and others after him, place the date of his birth three years earlier, in 1477: but as Giorgione was confessedly older than he, and was born in 1478, we have preferred the authority of the former, as most likely to be correct. The education he received, first from Sebastiano Zuccati of Treviso, and afterwards from Giovanni Bellini at Venice, rendered him a diligent and subtle observer of nature. His early works exhibit the greatest correctness of imitation, but in a laboured and minute style, with a finish so highly wrought, that when, at a maturer age, he painted a picture for Ferrara of the tribute-money, in competition with Albert Durer, he excelled in nicety of pencilling that master of minuteness; with this difference, that his finish did not, like the German's, obtrude itself, and impede the general effect, but obtained grandeur by distance. This picture, to which he made no companion, as he soon after changed his style, now adorns the gallery of Dresden, and remains a proof of the sense this great artist entertained of the falsity of that taste, which seeks for gratification in mere finish, and which he deserted for the adoption of a style conveying general character instead of identity. It was from the better taste of his fellow pupil, Giorgione, that Titian imbibed a more exalted view of art, and was induced to quit the meaner and more confined style with which he commenced his practice; and some portraits which he painted about this time are scarcely to be distinguished from those of Giorgione himself. But he seems to have found it not exactly to his mind, and soon discovered a variety of style more congenial to his own feelings; less softened, and perhaps less grand, but more agreeable; a style which delights the spectator less by novelty of effect, than by the exactness of truth. His first work in this style, which is entirely his own, and may be denominated Tizianesque, is the archangel Raphael leading Tobiah, painted in his thirtieth year for the sacristy of S. Marciale; and soon after he painted the Presentation of the Virgin, at the Carita; one of the richest and most numerous of his compositions remaining.

When only eighteen years of age, he had painted a portrait of the head of the Barbarigo family, which excited universal admiration; and he was soon afterwards employed, in concert, or rather in rivalry, with Giorgione, to paint one of the fronts of the Fondaco de Tedeschi, when unhappily the jealousy already subsisting between these great artists was strengthened by the superior encomiums bestowed upon Titian. On the death of Giorgione in 1511, Titian succeeded him in several important commissions, and continuing to increase in renown, was invited to the court of Alfonso, duke of Ferrara, for whom he painted the celebrated picture of Bacchus and Ariadne, now in England. Here he became acquainted with the poet Ariosto, whose portrait he painted, and in return was celebrated by him in his Orlando Furioso.

About 1523, Titian produced the work which, above all others, elevates him in the scale of merit among painters; *viz.* the celebrated picture of the Death of St. Peter the Martyr, for the church of S. Giovanni and S. Paolo at Venice, which has by almost all artists and connoisseurs

been considered his chef-d'œuvre in history. This extraordinary picture was one of the first objects of French spoliation at Venice. It was painted originally on wood, but was transferred to canvas in France, in consequence of its having been much blistered from the wood by the effect of sea-water in its voyage to Marseilles; and it is now returned to its original station in a more agreeable, if not more perfect condition, than when it was first removed. The excellence of this picture procured him, according to Vafari, a commission from the senate to paint the battle of Cadore between the Venetians and the Imperialists, or the rout of Giaradadda, in which the action proceeded during a tremendous storm of rain. This grand work was destroyed by fire, but the composition is preserved to us by the print engraved by Fontana. Besides these, he painted several other public works, which, together with the friendly assistance of Pietro Aretino, whose pen delighted to dwell upon the powers of this great artist's pencil, spread his fame in every direction, and he was honoured with a superabundance of employment. In 1530, when Charles V. came to Bologna to be crowned by pope Clement VII. Titian was sent for by the cardinal Hippolito de Medici to paint the portrait of the monarch, which he did on horseback and in armour; which so pleased Charles, that he gave the painter 1000 crowns of gold, and declared he would never be painted by any body else. When Titian returned to Venice, he found Pordenone much employed and supported by several of the principal persons; but his great superiority soon became too manifest to be resisted, and he was more than ever employed, both publicly and in private.

In 1541 the emperor returned to Bologna, to hold a conference with the pope, and was again painted by Titian, as was also the cardinal Hippolito de Medici in a Hungarian dress. He also painted his friend P. Aretino, who about this time introduced him to Fred. Gonzaga, duke of Mantua, whom he painted, and also, for him, a series of the twelve Cæsars for a saloon in the palace; underneath each of which, Julio Romano afterwards painted a subject from each of their histories.

Titian had soon after the honour of painting pope Paul III., when he visited Ferrara in 1543, and was invited by that pontiff to Rome; but he excused himself at that time on account of an engagement with the duke of Urbino, whose portrait he painted with so much fire and truth, that Aretino honoured it with a sonnet, comparing it with that of Alexander by Apelles. He painted also several other pictures for the same duke of Urbino (Francesco Maria), and when he had completed his engagement there, accepted another invitation to Rome, sent by the pope, through the medium of cardinal Bembo.

He arrived there in 1546, according to Vafari, who was already known to Titian, having seen him at Venice, and was on this occasion honoured by the cardinal's appointing him Cicerone to this great painter; to conduct him through the city, and to show him its beauties. Nothing could be more flattering than his reception by the pope, who immediately upon his arrival assigned him apartments in the Palazzo Belvidere, and employed him in painting his portrait at whole length, and those of the cardinal and the duke Ottavia, which gave universal satisfaction; but an *Ecce Homo*, which he painted as a present to the pope, was not esteemed by the Roman artists, whose minds were accustomed to the works of Raphael and M. Angelo. The latter is said to have remarked to Vafari, after seeing Titian at work on his *Danæ*, that it was a great pity the Venetian painters applied themselves so little to design, and had not a better mode of study,

study, being so perfectly skilful in colour and imitation. Adding, "if this man were as much aided by art in design as he is by nature, and most particularly so in giving just resemblance of natural objects, he would be perfect; as he has a noble spirit, and a beautiful and lively manner."

He did not remain long in Rome, but on his return to Venice visited Florence, where he beheld with delight the great works of art with which it is adorned, and visited the grand duke Cosmo, who declined his offer to paint his portrait, perhaps, as Vafari observes, that he might not give umbrage to the ingenious artists of his own city and dominions.

Immediately upon his arrival at Florence, he received an invitation from his patron, Charles V., to visit Spain, and accordingly went to Madrid, where he arrived in 1550. He remained there three years, during which time he painted a great number of portraits and historical pictures. For the portrait which he painted of the emperor, he received 1000 crowns of gold, and was created a knight of the order of St. Jago, and a count palatine of the empire, with a stipend from the treasury of Naples of 200 crowns annually; and to this, Philip II. added afterwards 200 more, besides paying him munificently for each of his productions. When Charles had devoted his life to the austerities of a convent, he commissioned him to paint a large picture of the Trinity, accompanied by the Holy Virgin, and surrounded by saints and angels, in which the emperor, and the empress his wife, were represented elevated to the heavens, and in the act of adoration. There is a sketch of it in England, and a print has been engraven from the picture, by which it appears to have been a very grand work.

Though Titian had returned to his native place before Philip II. came into possession of the throne, and was as much engaged as he could be, yet that monarch, when he had built the Escorial, and conceived the idea of enriching it with the most splendid materials, resorted to his father's favourite painter to assist him in perfecting it; and though it does not appear that Titian returned to Spain, yet he must have employed his pencil very assiduously in its service from the very great number of his pictures which are to be found there, many of them among his very finest productions. Several of these have been withdrawn by the scruples of bigotry from public view; and among them his picture of a sleeping Venus, which was presented by Philip IV. to our Charles I., when prince of Wales, on his visit to Spain, and which after his death was purchased by the Spanish ambassador, then resident here.

Titian was invited by Henry VIII. to England, but his numerous engagements on the continent prevented him from coming. He painted, however, two pictures for Henry, which now adorn Cleveland House (the marquis of Stafford's). Their subjects are the Bath of Diana, with the unfortunate intrusion of Acteon, and the Discovery of the crime of Calista, and both are exquisite performances, and in tolerably good preservation. They continued in the royal collection till it was dispersed on the death of Charles I., and found their way into the gallery of the duke of Orleans; and on the purchase of the Italian part of that collection being effected by the duke of Bridgewater, the earl of Carlisle, and lord Gower, these pictures fell to the lot of the former of these noblemen.

This great painter is one of the happy few, for whom nature and circumstances have combined in fortunate conjunction. "For him," as Vafari justly observes, "health and fortune laboured, and he received of heaven only happiness and blessings." By him the highest among men, the

most learned, and the most beautiful, were proud to have their portraits transmitted to posterity. He was handsome in person and graceful in manners, and lived in a style worthy of one so honoured and beloved. These blessings he was permitted to enjoy through a very uncommon portion of human existence, which was at length interrupted by the plague in his 96th year. He appears to have been able to pursue his delightful art to a very advanced period, for Vafari found him painting in 1566, when he visited him at Venice, and speaks of it with pleasure; and though it may well be imagined that the latter productions of his pencil exhibit the strong hand of time, yet they are free and masterly in every thing in which a perfect knowledge of the principles of the art are concerned, and weak only in the execution.

Had Giorgione lived but to one-half of the lengthened years of his great rival, Titian might not perhaps have stood so completely at the head of the Venetian school of painting, as from his numerous excellent productions he now does. That noble work, the death of S. Pietro Martire, alone fully entitles him to this distinction and honour: perhaps no other production of the pencil is so perfect in the combination of every requisite quality of a fine painting; composition, design, action, expression, chiaro-scuro, and colour. The choice of the scene, and the accompaniments, are every way adapted to assist in creating alarm and dismay: the tone of evening or twilight spread over the whole, and contrasted to the brilliant ray of heavenly light from above, aids the impression; and the execution is in every part correspondent to the grandeur of form selected. This picture he painted, as we have said, in the prime of his life, when he was about forty-three; and he continued long after to work in the same style, which is of his own creation, and totally different from both his former laboured one, and his latter loose and vague manner. In this picture, every part is wrought to an exact character of representation, though without minuteness, or in any degree trespassing upon the heroic nature of the tragic subject; and there is no introduction of heterogeneous matter, as is too frequently to be found in his historic productions. Here he appears to have caught a glimpse of the grandeur of Michael Angelo's style, and to have employed it more effectually than in any other of his works, except perhaps in the figures on the ceiling of the Salute at Venice, and the martyrdom of St. Laurence in the Jesuits'. In general, his selection of form is but little improved upon his model; his male figures being too fleshy for character or action, and his females too full for elegance.

The mind of Titian appears to have been of a sedate and rather serious character. There is, as sir Joshua Reynolds has observed, "a senatorial dignity about him," which distinguishes him from his compeers of the Venetian school. All his compositions are arranged with gravity; even the gay and sometimes licentious subjects which he now and then amused himself with, are conducted with such a scale of chiaro-scuro and colour, as gives an air of morality to their effect, which imposes upon the spectator a tone of sobriety, and induces him to discard those loose thoughts which the gay luxuriance of the style of Rubens, treating the same compositions, would inevitably excite.

Colouring appears to have been the grand foundation of the success of Titian. He knew better than any other painter the just power of each colour of his palette; and by this knowledge, produced a species of chiaro-scuro independent of light and shade, and perfectly distinct from that of Corregio and Lionardo da Vinci, and more immediately imitative of the general effects of nature. Master of the means

means of imitating the most subtle combinations of colour in visible objects, and fully comprehending the degrees of purity or of tone with which colours might be employed individually or collectively, to assist in projecting or withdrawing the various parts of a picture, he never fails to gratify the eye with a full and true relief, correspondent with the nature of the subject. In this quality he was as much ideal, as the Greeks and Florentines were in form; for though the harmony and richness which he produced are to be found occasionally in nature, it is neither her every day attire, nor is it to be comprehended by superficial observers. There is a science of exceeding import to painting in the arrangements of colours, by which a skilful artist will create attraction or disgust, as it pleases him. Change the position of the colours of that most beautiful of nature's works, the rainbow; let the blue and the green occupy the centre, and the red and yellow the edges of it; and judge how far it will decrease in its power of attraction. Of this science, Titian was the first great possessor; and as he possessed the knowledge of the value of colours, so also did he that of the nature of shade; that colour (to the painter at least, though it be the absence of it to the philosopher) which destroys all colours, and renders all alike obscure; and which is the most difficult of attainment in all that relates to the art of colouring. The tone of shade that Titian employed, whatever be the substance which produced it, was used by no other so successfully, except Tintoretto. It seems, in its union with the local colours of objects, to have produced the half tints without further labour; or at least to have laid such a foundation, as to have made that of the subsequent tinting very trifling; and doubtless this mode of proceeding rendered him able to produce such an infinity of works as appear to have issued from his pencil. His errors flowed naturally, from the ease with which he produced the beauties of his style; and as the mind was filled with gratification by the delightful harmony and richness of colour his works presented, so it sought the less for the qualities of expression, and appropriate dress and action in the figures; and would not condemn too rudely the frequent admission of heterogeneous matter.

To the accusations of exhibiting defects like these, the works of Titian are far less justly subject than those of his imitators and successors in the Venetian school of painting; none of whom possessed the taste and judgment of this great master, though many were eminently skilful in their respective departments.

TITIANO, GIROLAMO DANTE, called *Il*. According to Ridolfi, he was brought up in the school of Titian, and was employed by that master to assist him in several of his works. By frequently painting in conjunction with him, and sometimes copying his works, some of his pictures, retouched by Titian, have passed for originals by that master. He sometimes painted from his own designs, and his picture in the church of St. Giovanni at Venice, representing S. S. Cosmo and Damiano, is worthy of the school in which he was educated. Bryan's Dict.

TITICACA, or CHUCUITO, in *Geography*, a lake of South America, in the viceroyalty of Buenos Ayres, diocese of La Paz, and jurisdiction of Chucuito, the figure of which is oval, inclining nearly from N.W. to S.E., its circumference being about 80 leagues, and depth near the shore from four to six fathoms, and towards the middle forty or fifty, without any shoals. Ten or twelve large rivers, beside a great number of smaller streams, discharge themselves into it. The water, though neither bitter nor brackish, is somewhat turbid, and its taste is so nauseous that it cannot be drunk. It abounds with fish of two very

different kinds; one large and palatable, called by the Indians Suchis, and the other small, insipid and bony, long since called by the Spaniards Boyas. It has also a great number of geese, and other wild fowl, and the shores are covered with flags and rushes, the materials of which the bridges are made. The western borders of this lake are called Chucuito, and those on the E. are denominated Omaseuyo. It contains several islands, from one to another of which the Indians pass on their balsas, a kind of rafts, supported by inflated skins. One of these islands is very large, and was anciently one mountain, since levelled by order of the Incas: this gave to the lake its own name of Titicaca, which, in the Indian language, signifies a mountain of lead. In this island the first Inca, Mancho-Capac, the illustrious founder of the empire of Peru, invented his political fable, that the sun, his father, had placed him, together with his sister and consort Mama Oello Huaco, there, enjoining them to draw the neighbouring people from the ignorance, rudeness, and barbarity in which they lived, and humanize them by customs, laws, and religious rites dictated by himself; and in return for the benefits resulting from this artful stratagem, the island has, by all the Indians, been considered as sacred; and the Incas, determining to erect on it a temple to the sun, caused it to be levelled, that the situation might be more delightful and commodious.

This was one of the most splendid temples in the whole empire. Besides the plates of gold and silver with which its walls were magnificently adorned, it contained an immense collection of riches, all the inhabitants of provinces which depended on the empire, being under an indispensable obligation of visiting it once a year, and offering some gift. Accordingly, they always brought in proportion to their zeal or ability, gold, silver, or jewels. This immense mass of riches, the Indians, on seeing the rapacious violence of the Spaniards, are thought to have thrown into the lake; as it is certainly known they did with regard to a great part of those at Cusco, among which was the famous golden chain made by order of the Inca Huayna-Capac, to celebrate the festival of giving name to his eldest son. But these valuable effects were thrown into another lake, six leagues S. of Cusco, in the valley of Orcos: and though numbers of Spaniards, animated with the flattering hopes of such immense treasures, made frequent attempts to recover them, the great depth of the water, and the bottom being covered with slime and mud, rendered all their endeavours abortive. For notwithstanding the circuit is not above half a league, yet the depth of water is in most places not less than twenty-three or twenty-four fathoms.

Towards the S. part of the lake Titicaca, the banks approach each other, so as to form a kind of bay, which terminates in a river called El Defaguadero, or the drain, and afterwards forms the lake of Paria, which has no visible outlet; but the many whirl-pools sufficiently indicate that the water issues by a subterraneous passage. Over the river Defaguadero is still remaining the bridge of rushes, invented by Capac Yupanqui, the fifth Inca, for transporting his army to the other side, in order to conquer the provinces of Collafuyo. S. lat. 16° 10'. W. long. 69° 56'.

TITILLARES VENÆ, a name given by some authors to the iliac veins.

TITILLATION, TITILLATIO, the act of tickling, *i. e.* exciting a sort of pleasurable idea, by a gentle application of some soft body, upon a nervous part; and which usually tends to produce laughter.

TITILLICUM, a word used by some anatomical writers for the arm-pit.

TITINARA, in *Geography*, a mountain of Russia, in the

the government of Upha. N. lat. 52° 25'. E. long. 61° 14'.

TITIOPOLIS, in *Ancient Geography*, a town of Asia, in Iſauria, or the ſecond Cilicia, one of the twenty-three towns, which, according to the Notitia of Hierocles, were under the metropolis of Seleucia; named Titopolis by William of Tyre.

TITISNESS, in *Geography*, a ſmall iſland near the coaſt of Lapland, at the entrance of a bay called Titsfiord. N. lat. 67° 36'.

TITIUM FLAVUM, in *Ancient Geography*, a river of Illyria, which diſcharged itſelf into the ſea at Scardona, and ſerved as a boundary between Liburnia and Dalmatia. Pliny. It is named Titus by Ptolemy.

TITIZIGHE, in *Geography*, a ſea-port town of the principality of Gurjel, with a good harbour, on the Black ſea. This place is alſo called Pghino; 10 miles S. of Puti.

TITLARK, in *Ornithology*. See **ALAUDA Pratenſis**.

TITLE, **TITULUS**, an inſcription put over any thing, to make it known.

The word is more particularly uſed for the inſcription in the firſt page of a book, expreſſing the ſubject of it, the author's name, &c.

What tortures abundance of authors, is to find ſpecious titles for their books: a title ſhould be ſimple, and yet clear: theſe are the two genuine characters of this kind of compoſition. Aſſuming titles are prepoſſeſſion againſt the authors.

TITLE, *Titulus*, in the *Civil* and *Canon Law*, denotes a chapter or diviſion of a book.

A title is ſubdivided into paragraphs, &c.—Each of the fifty books of the *Digeſt* conſiſts of a number of titles; ſome of more, others of leſs.

TITLE is alſo an appellation of dignity, diſtinction, or pre-eminence, given to perſons poſſeſſed of the ſame.

The titles of order or dignity, *Loyſeau* obſerves, ſhould always come immediately after the name, and before the titles of office.

The king of Spain has a whole page of titles, to expreſs the ſeveral kingdoms and ſignories of which he is maſter. The king of England takes the title of *king of Great Britain and Ireland*: the king of France, the title of *king of France and Navarre*: the king of Sweden intitles himſelf *king of the Swedes and Goths*: the king of Denmark, *king of Denmark and Norway*: the king of Sardinia, among his titles, takes that of *king of Cyprus and Jeruſalem*: the duke of Lorraine, the title of *king of Jeruſalem, Sicily, &c.*

The cardinals take titles from the names of ſome churches in Rome: as of *St. Cecilia, St. Sabina, &c.* and they are called cardinals of the title of *St. Cecilia, &c.*

The emperor can confer the title of prince, or count of the empire; but the right of ſuffrage in aſſemblies of the empire depends on the conſent of the eſtates.

The Romans gave the titles of Africanus, Aſiaticus, Macedonicus, Numidicus, Creticus, Parthicus, Dacicus, &c. in memory of the victories obtained over the people of thoſe countries. The king of Spain, after the like manner, gives honourable titles to his cities, in recompence for their ſervices, or their fidelity.

TITLE expreſſes alſo a certain quality aſcribed by way of reſpect to certain princes, &c.

The pope has the title of *holineſs*; a cardinal prince of the blood, that of *royal highneſs*, or *moſt ſerene highneſs*, according to his nearneſs to the throne; other cardinal princes, *moſt eminent highneſs*; an archbiſhop, *grace* and *moſt reverend*; a biſhop, *right reverend*; abbots, prieſts, religious, &c. *reverend*.

As to ſecular powers, to the emperor is given the title of *imperial majeſty*; to king, *majeſty*; to the king of France, *moſt chriſtian majeſty*; to the king of Spain, *catholic majeſty*; to the king of England, that of *defender of the faith*; to the Turks, *grand ſignor* and *highneſs*; to the prince of Wales, *royal highneſs*; to the dauphin of France, *ſerene highneſs*; to electors, *electoral highneſs*; to the grand duke, *moſt ſerene highneſs*; to the other princes of Italy and Germany, *highneſs*; to the doge of Venice, *moſt ſerene prince*; to the republic or ſenate of Venice, *ſignory*; to the grand-maſter of Malta, *eminence*; to nuncios, and to ambaffadors of crowned heads, *excellency*.

The emperor of China, among his titles, takes that of *tienſu*, ſon of heaven. The Orientals, it is obſerved, are exceedingly fond of titles: the ſimple governor of Schiras, for inſtance, after a pompous enumeration of qualities, lordſhips, &c. adds the titles of *flower of courteſy*, *nutmeg of conſolation*, and *roſe of delight*.

TITLE, in *Law*, denotes a right which a perſon has to the poſſeſſion of any thing.

A title to lands is thus defined by ſir Edward Coke: *titulus eſt juſta cauſa poſſidendi id quod noſtrum eſt*, or it is the means by which the owner of lands hath the juſt poſſeſſion of his property. There are ſeveral ſtages or degrees requiſite to form a complete title to lands and tenements. The loweſt and moſt imperfect degree of title conſiſts in the mere naked poſſeſſion, or actual occupation of the eſtate, without any apparent right, or any ſhadow or pretence of right, to hold and continue ſuch poſſeſſion. See **DISSEISIN**.

The next ſtep to a good and perfect title is the right of poſſeſſion, which may reſide in one man, while the actual poſſeſſion is either in himſelf or another. The third circumſtance attending a title is the mere right of property, the *juſ proprietatis*, without either poſſeſſion or even the right of poſſeſſion. It is poſſible that one man may have the poſſeſſion, another the right of poſſeſſion, and a third the right of property. But in the union of theſe three qualifications conſiſts a complete title to lands, tenements, and hereditaments. For it is an ancient maxim of the law, that no title is completely good, unleſs the right of poſſeſſion be joined with the right of property; which right is then denominated a double right, *juſ duplicatum*, or *droit droit*. And when to this double right the actual poſſeſſion is alſo united, when there is, according to the expreſſion of *Fleta, juſ et ſeiſinæ conjunctio*, then, and then only, is the title completely legal.

The ſtatute 32 Hen. VIII. c. 9, hath provided, that no one ſhall ſell or purchaſe any preſented right or title to land, unleſs the vendor hath received the profits thereof for one whole year before ſuch grant, or hath been in actual poſſeſſion of the land, or the reverſion or remainder; on pain that both the purchaſer and vendor ſhall each forfeit the value of ſuch land to the king and the proſecutor.

A title to things perſonal may be acquired or loſt by occupancy, by prerogative, by forfeiture, by cuſtom, by ſucceſſion, by marriage, by judgment, by gift, by contract, by bankruptcy, by teſtimony, and by adminiſtration. *Blackſt. Com. b. ii.* See **POSSESSION** and **PROPERTY**.

Title is alſo an authentic inſtrument, by which a man can prove and make appear his right.

There muſt be at leaſt colourable title to come into poſſeſſion of a benefice, otherwiſe the perſon is deemed an intruder. For preſcription with title, ſee **PRESCRIPTION**.

TITLE, in the *Canon Law*, is that by virtue of which a beneficiary holds a benefice: ſuch is the collation of an ordinary, or a proviſion in the court of Rome, founded on a reſignation, permutation, or other legal cauſe. The title

of a benefice, or beneficiary, is either a true or a colourable one. A *true* or *valid* title is that which gives a right to the benefice: such is that received from a collator who has a right to confer the benefice on a person capable of it, the usual solemnities being observed. See **COLLATION**, &c.

Colourable title is a seeming one; *i. e.* such an one as appears valid, and is not. Such would that be founded on the collation of a bishop, in case the benefice in question were not in his collation.

By the canons, a colourable title, though false, produces two very considerable effects. 1. That, after peaceable possession for three years, the incumbent may defend himself by the rule *de triennali possessione*, against such as would dispute the benefice with him. 2. That in case he be prosecuted within three years, and obliged to surrender the benefice, he shall not be obliged to restore the produce of it, during the time he possessed it.

TITLE is also used, in several ancient synods and councils, for the church to which a priest was ordained, and where he was constantly to reside.

"Nullus in presbyterum, nullus in diaconum, nisi ad certum titulum ordinetur." Concil. Londin. ann. 1125.

There are many reasons why a church might be called *titulus*, title: the most probable Cowel takes to be this, that in ancient days the name of the saint to whom the church was dedicated was engraved on the porch, as a token that the saint had a title to that church: whence the church itself became afterwards to be called *titulus*.

TITLES, or *Titular Churches*, M. Fleury observes, were formerly the denomination of a particular kind of churches at Rome.

In the sixth and seventh centuries, there were four sorts of churches in that metropolis; *viz.* *patriarchal*, *titular*, *diaconal*, and *oratorial*. The *tituli*, *titular*, were, as it were, parishes, each assigned to a cardinal-priest, with a certain district or quarter depending on them, and a font for the administration of baptism in case of necessity.

TITLE, *Clerical* or *Sacerdotal*, denotes a yearly revenue or income of the value of fifty crowns, which the candidates for priesthood were anciently obliged to have of their own, that they might be assured of a subsistence.

By the ancient discipline there were no clerks made, but in proportion as they were wanted for the service of the church, which is still observed with regard to bishops; none being consecrated, but to fill some vacant see.

But for priests, and other clerks, they began to make vague ordinations in the East as early as in the fifth century: this occasioned the council of Chalcedon to declare all vague and absolute ordinations null.

Accordingly the discipline was pretty well observed till towards the end of the eleventh century; but then it began to relax, and the number of priests was exceedingly increased; either because the people became desirous of the privileges of the clericate, or because the bishops sought to extend their jurisdiction.

One of the great inconveniences of these vague ordinations was poverty, which frequently reduced the priests to sordid occupations, and even to a shameful begging. To remedy this, the council of Lateran laid it on the bishops to provide for the subsistence of such as they should ordain without title, till such time as they had got a place in the church that would afford them a settled maintenance.

There was also another expedient found out to elude the canon of the council of Chalcedon; and it was appointed, that a priest might be ordained on the title of his patrimony; that is, it was not necessary he had any certain place

in the church, provided he had a patrimony sufficient for a creditable subsistence.

The council of Trent retrieved the ancient discipline in this respect, forbidding all ordination, where the candidate was not in peaceable possession of a benefice sufficient to subsist him; and allowing nobody to be ordained on patrimony or pension, unless where the bishop declares it to be expedient for the good of the church: so that the benefice is the rule, and the patrimony the exception. See **ORDINATION**.

But this rule is not regarded, even in some Catholic countries, particularly France, where the patrimonial title is the most frequent; and the title is even fixed to a very moderate sum.

As to religious, the profession they make in a monastery serves them for a title, in regard no convent is obliged to maintain them: and as to mendicants, they are maintained upon the *title of poverty*.

Those of the house and society of the Sorbonne are also ordained without any patrimonial title, and on the sole title of poverty; it being supposed a doctor of the Sorbonne can never want a benefice.

TITLE for Orders. See **DEACON**, **ORDINATION**, and **PRIEST**.

TITLIS, in *Geography*, a mountain of Switzerland, in the canton of Uri, the most elevated in those parts, and scarcely inferior to the Schreckhorn and Jungfrau: it was for a long time considered as inaccessible. The summit of this mountain is called Nollen, and commands a very picturesque scene of mountains and vallies; 11 miles S.S.W. of Altorff.

TITMEG, a lake of North America. N. lat. 62° 15'. W. long. 99°.

TITMOUSE, in *Ornithology*. See **PARUS**.

TITOLO, in *Geography*, a town of Naples, in the province of Basilicata; 6 miles S.W. of Potenza.

TITONEUS, in *Ancient Geography*, a mountain situated on the confines of Thrace and Macedonia.

TITOVO, in *Geography*, a town of Russia, in the government of Kaluga; 40 miles E.S.E. of Kaluga.

TITSCHIN, *New*, or *Nowi Giezi*, a town of Moravia, in the circle of Prerau, well built and defended by walls; 2½ miles E.N.E. of Prerau. N. lat. 49° 32'. E. long. 18° 10'.

TITSCHIN, *Alt*, a town of Moravia; 2 miles S.W. of New Titschein.

TITSCHIN, a town of Moravia, in the circle of Olmutz; 16 miles S. of Olmutz.—Also, a town of Moravia, in the circle of Prerau; 8 miles S.W. of Freyberg.

TITTERIE, a southern province of Algiers, which extends from the river Mafaffran, on the W., to the river Booberak, on the E.: northward it is bounded by the Mediterranean, and southward by Sahara; about 60 miles long and 40 broad.

TITTERIE Gewale, a lake of Algiers, situated near mountains; 60 miles S. of Algiers.

TITTERIE Dofb, or *Hadjar Titterie*, a ridge of precipices in Algiers: on the summit is a large plain, with only one narrow road leading up to it, where a tribe of Arabs keep their granaries; 50 miles S. of Algiers.

TITTING, or **DIETTING**, a town of Bavaria, in the bishopric of Aichstatt; 5 miles N. of Aichstatt.

TITTIUS, in *Botany*, a name given by Rumphius, Amboyn. v. 3. t. 19, and t. 20, to two very different kinds of trees, the latter of which is supposed by Jussieu to be a **CORNUTIA**. See that article.

TITTMANING, or **DITTMANING**, in *Geography*; a town

town of the archbishopric of Salzburg, on the Salza. In the year 1310, a pestilential disease made such ravages in this town, that 1300 persons died between the 11th of November and the 2d of February following. In the year 1571, almost the whole town was burned down by lightning; 20 miles N.N.W. of Salzburg. N. lat. 48° 1'. E. long. 12° 44'.

TITTUA, in *Ancient Geography*, a town of India, on this side of the Ganges, which belonged to the Caræans. Ptol.

TITUBATION, in *Astronomy*. See **TREPIDATION**.

TITUL, in *Geography*, a town of Hungary, on the Theysse. This town has often been taken and retaken by the Imperialists and Turks; 24 miles E.S.E. of Peter Warden.

TITULAR, or **TITULARY**, denotes a person invested with a title, in virtue of which he holds an office or benefice, whether he performs the functions of it or not. In this sense the term is used in opposition to survivor, and to a person only acting by procurator, or commission. An officer is always reputed titular till he hath resigned his office, and the resignation hath been admitted.

TITULAR is also sometimes applied adjectively to a person who has the title and right of an office or dignity, but without having possession, or discharging the function of it.

It is sometimes also used abusively for a person who assumes and pretends a title to a thing, without either a right to it, or a possession of it.

TITULAR Churches. See **TITLES**.

TITULARS of Tithes, a term sometimes applied to persons who had the possession of tithes under the crown in Scotland. They had also other names or titles applied to them in some cases. See **TITHES**.

TITULCIA, in *Ancient Geography*, a town of Hispania Citerior, between Mantua to the N.E. and Toletum to the S.W.; marked in Anton. Itin. on the route from Saragossa to Emerita.

TITUS, in *Scripture Biography*, a disciple and companion of the apostle Paul, who attended him in many peregrinations to Jerusalem, Ephesus, and Crete, and who was deputed by him on several important services. For an account of the epistle addressed to him by St. Paul, see **EPISTLE**.

TITUS VESPASIANUS, in *Biography*, a Roman emperor, was the eldest son of Vespasian, and born A.D. 40. In the course of his education at the court of Nero, he made a great proficiency in the study of eloquence and poetry. In his military service he first ranked as tribune in Germany, and afterwards in Britain; and by his valour and skill, as well as by the graces of his person and manners, obtained great applause. On his return to Rome, he acquired reputation in the forum as a successful pleader. His first wife was the daughter of a Roman knight, and after her death he married a lady of illustrious descent, whom he divorced after she had borne him one daughter. Having distinguished himself as quæstor, he served as lieutenant under his father in the war of Judea, during which he gained renown, not only by his military enterprises, but by the mildness and generosity of his temper; and though he did not abstain from the indulgences of youthful propensities, he did not neglect serious occupations. When Vespasian, after the death of Otho, was deliberating about assuming the purple, he acted as mediator in the confederacy between him and Marianus, the governor of Syria; and when Vespasian marched to Italy, Titus was entrusted with the prosecution of the war in Judæa. When his father took possession of the imperial authority, he declared Titus his colleague in the consulate, A.D. 70. In that year Jerusalem was taken after a calamitous siege, and the destruction of the temple, which

Titus wished to have preserved. After the reduction of Jerusalem, he went to Alexandria, and took part in the superstitious consecration of the ox Apis; and after having given audience to the ambassadors of the king of Parthia, he hastened to Rome with a view of counteracting some unfavourable rumours, and was honoured with a magnificent triumph. Vespasian admitted him to a participation of the empire, and they continued to co-operate in the exercise of the imperial power, and lived together in amicable intercourse. Suetonius, however, intimates that Titus's conduct was in a variety of respects very far from being irreproachable, either in private life or in his public character. During the war in Judæa, he had indulged a violent passion for Berenice, daughter of Agrippa I. king of the Jews, and widow of Herod, king of Chalcis; and as she followed him to Rome, he gave offence to the people by his attachment to a foreign queen of doubtful reputation; and, as Suetonius says, suspicions were entertained that Titus would eventually prove a second Nero.

Upon the death of Vespasian, A.D. 79, Titus immediately succeeded him; and by his conduct towards his rival Domitian, and to those who adhered to his interest, he gained the affection of the people, and established a character, which has caused him to be recorded under the glorious title of "The Delight of the Human Race." Although his reign was short, it was distinguished by a series of beneficent actions; not always, perhaps, equally liberal in the principle from which they originated. This course of beneficence was commenced by a confirmation of all the grants and donations made by his predecessors. And he thus established a precedent, which governed the conduct of his successors. Upon assuming the office of chief pontiff, he avowed it to be a solemn engagement not to shed the blood of a citizen, and to this resolution he adhered in a conspiracy against himself. In the case of one of the two patricians implicated in this crime, he calmed the anxiety of his mother by deputing a special messenger to assure her that her son's life was in no danger. Besides, he abrogated the law of high-treason with respect to all convictions for words or writings against the person or dignity of the emperor.

It was one of his maxims, "that no one ought to depart discontented from the person of his prince;" and on this he founded his practice of giving hopes to petitioners when he thought it necessary to refuse their requests. If we connect this maxim with his well-known exclamation at the close of a day on which he had conferred no benefit, "My friends I have lost a day," we cannot forbear suspecting that the benefits to which he referred were rather acts of private bounty to courtiers or importunate suitors, than the performance of public duties. Many instances occur of his love of popularity, and of the excess in which he indulged it. The public calamities that happened during his reign gave occasion for the exercise and display of his compassion and bounty; such were the great eruption of mount Vesuvius, which destroyed Herculaneum, Pompeii, and other towns; and the conflagration of Rome, which was followed by a fatal epidemic disorder. His general conduct entitled him to the affection of his subjects; nor does he seem to have deserved reproach for any act of injustice or oppression. Whilst he was on a journey to the country of the Sabines, he was seized with a fever, which terminated fatally, on the 13th of September, A.D. 81, in the 41st year of his age, and after a reign of two years and less than three months. Apprehending his dissolution, he lamented his early and premature doom; and yet, though his death was deplored at Rome as a general calamity, it was perhaps, considering the flexibility of his disposition, and his inclination to profuse

expenditure, favourable to his own reputation and to the public prosperity and happiness. Suetonius. *Anc. Un. Hist.* Crevier's *Rom. Emp.*

TITWALLA, in *Geography*, a town of Hindoostan, in Baglana; 28 miles E. of Basseen.

TITYRUS MONS, in *Ancient Geography*, a mountain in the western part of the isle of Crete, in the country named Cydonia, according to Strabo. On this mountain was a temple named *Dietyynnæum Templum*. In some copies of Strabo, this mountain and temple are placed in the town of Cydonia.

TITZ, in *Geography*, a town of France, in the department of the Roer; 4 miles N.N.E. of Juliers.

TITZLA, a town of Asiatic Turkey, in Caramania, on a salt lake; 60 miles S.W. of Kirshehr.

TIVA, a town of the Arabian Irak; 130 miles W. of Bassorah.

TIVER, in *Rural Economy*, the provincial name of a substance of the colouring ochre kind, used for marking sheep in some places.

TIVERING, a term applied to the act or operation of marking sheep and lambs in different ways, with the material of the tiver kind, in some districts and places, for particular uses and purposes. Thus, it is a practice with some correct sheep-farmers to have their sheep tivered so as to ascertain different points in their management with great exactness. The bows or breasts of the rams are tivered every two or three days in the tugging or riding season, and the ewes which are put to them, the first week, marked with one stroke of tiver, those of the second week, with two strokes, and so on. The tivering of sheep is also useful on many other occasions for marking and distinguishing the objects and views of the sheep-farmer. The practice of it is very common in the Romney-marsh system of sheep-grazing. See **SHEEP**.

TIVERTON, in *Geography*, anciently called *Twysford-town*, a borough and market-town in the hundred of the same name, and county of Devon, England; is situated on the slope of a hill between the rivers Exe and Loman, 14 miles N. by E. from Exeter, and 163 miles W. by S. from London. In the time of Alfred it was only a village, but had twelve tithings belonging to it, and was governed by a portreeve. Henry I. granted the manor and lordship to Richard Rivers, afterwards earl of Devon, by whom a castle was erected here about the year 1106, which continued to be the baronial residence for a considerable number of years. The attractions of the castle occasioned a great increase in the buildings and population of Tiverton; and by the favour of the lords, it was invested with the privilege of a market as early as the year 1200. About fifty years afterwards, the stream of water, now called the Town-Leat, was conducted from the distance of five miles to supply the inhabitants; and a piece of waste land, called Elmore Common, was given for the benefit of the poorer classes, either for pasturage or for cultivation. These advantages continued to attract new settlers; but the most rapid augmentation of the town took place on the final establishment of the woollen manufacture about the year 1500. Towards the close of Elizabeth's reign, Tiverton was the principal place in the county for the manufacture of woollen goods; particularly kerseys, which still continue to be the chief article made here. About this period, the prosperity of the town received a temporary check; in 1591 it was visited by the plague, to which 550 persons fell victims; numbers fled for safety; and the inhabitants were so thinned, that the growing of grass in the streets is particularly recorded. Scarcely had the town recovered, when it was nearly destroyed by fire,

April 3, 1598, when more than four hundred houses were consumed, and thirty-three persons perished in the flames: the value of the property destroyed was estimated at 150,000*l.* In about a dozen years from that time, Tiverton was again esteemed a town of great importance, and called the chief market-town of the West. Many rich clothiers and merchants lived in it, and 8000 people were constantly employed in its woollen manufactures. The buildings were increasing in number and respectability, and Tiverton would have probably become one of the greatest manufacturing towns in the kingdom, but for a second conflagration, which destroyed nearly all the property of the inhabitants, and wholly blasted their flourishing expectation. In this fire, which happened August 5, 1612, six hundred houses were destroyed, with goods and merchandize to the amount of 200,000*l.*; and the inhabitants of every description were reduced to the greatest distress. The poor manufacturers were distributed in different towns, by which means the advantages of the clothing trade that had hitherto been exclusively enjoyed by Tiverton, were extended to other parts of the county. In the year 1615, Tiverton received its first charter of incorporation from king James; and its government was vested in a mayor, twelve capital burgesses, and twelve assistant burgesses. The right of returning two members to parliament was also granted to the same persons. This charter continued in force till 1723, when it was forfeited by neglect, and a new one, exactly similar, was granted by George I. In 1731, a third destructive fire occurred, which again nearly laid waste the town. During the 17th century, the trade and population progressively increased: but in the following century, rapidly declined: a favourable alteration has recently taken place, and the general trade of the town is now on a respectable basis. By the parliamentary return of the year 1811, the number of houses is stated to be 1303, the inhabitants 6732. A weekly market is held on Tuesdays, and two fairs annually. The spot of ground on which Tiverton is built, partakes of a triangular form, from the course of the rivers by which it is bounded. Its greatest length is nearly one mile; its breadth exactly three quarters. The four principal streets form a quadrangle, inclosing an area of gardens, in the centre of which is a bowling-green. Most of the houses are of red brick, or of stone, and are generally covered with blue slate. Those on the outskirts of the town, and at the ends of the streets, which escaped the fire of 1731, are of earth or cobb, covered with thatch. The principal buildings are the castle, the church, and the free grammar-school. The castle, from the present remains, appears to have been nearly of a quadrangular form, inclosing an area of about an acre, and surrounded by strong walls, from twenty to twenty-five feet in height. At the angles were embattled towers, about thirty-five feet high. This fortress was secured from attack on the W. side by a steep declivity of about sixty feet, on the edge of which a lofty wall was built. Two wide and deep moats, filled with water from the Town-Leat, defended the whole of the N. and S. walls to each side of the causeway leading to the gate on the E. This castle has been frequently exposed to sieges: during the reign of Stephen, and in the contest between the houses of York and Lancaster, it was several times subject to the assaults of the contending parties; and in the civil war of Charles I. being garrisoned for the king, it was besieged and taken by the parliamentary forces. From this period the castle has been falling to decay; and several of the ancient buildings have been converted into the offices of a farm. Great part of the S. and W. walls, with parts of the towers at the angles, are still standing. The moat at the S. side is converted into a good kitchen garden;

garden; that on the N. side is filled up, and made part of a court-yard. The church is situated on an eminence, at a short distance from the castle; and though the work of different ages, is more regular than might have been expected. The S. side is ornamented with much curious sculpture. The tower is a plain stone structure, ornamented with battlements and pinnacles: the height is 116 feet. The interior of the church is spacious, and its chancel is separated from the body of the church by a screen, ornamented with elegant tracery. The church being too small for the reception of the inhabitants of the town, a chapel of ease was erected about the year 1733; and here are also several meeting-houses for dissenters of various denominations. A free grammar-school was erected about the year 1604, pursuant to the will of Peter Blundell, a native, and eminent clothier of this town; who, from a very low origin, by a long life of successful industry acquired an ample fortune; and bequeathed 40,000*l.* to various charitable purposes. In this school he provided for the instruction of 150 boys: with maintenance for three scholars in each of the universities of Oxford and Cambridge, to be chosen out of his school. Here are also a charity-school, a free English school, several alms-houses, and other endowments for the benefit of the poor inhabitants. The other public buildings are: the town-house, a spacious edifice, appropriated to the meetings of the corporation, grand juries, and other public bodies; the market-house, a large quadrangular fabric, for the standing and sale of corn; and the hospital or poor-house, an extensive structure, erected in 1704, and containing various workshops for the employment of those whom indigence or misfortune may oblige to have recourse to it. The parish of Tiverton is upwards of nine miles in length, and about eight miles in breadth.

At a short distance to the south of Tiverton is Collipriest House, formerly the seat of the Blundell family, but now the property of Thomas Winslow, esq. who recently rebuilt and enlarged the mansion. It stands on the side of an eminence near the river Exe, having a sloping lawn in front, and a hanging wood behind.—*Historical Memoirs of the Town and Parish of Tiverton, &c.*; by Martin Dunsford, Exeter, 4to. 1790. *Beauties of England and Wales*, vol. iv. Devonshire; by J. Britton and E. W. Brayley, 1803.

TIVERTON, a town of Rhode island, in the county of Newport, containing 2837 inhabitants, situated on the Taunton river; 15 miles S.E. of Providence.

TIUHOLM, a small island of Denmark, in the Cattegat; 4 miles N.N.E. of Fladstrand.

TIVICA, a town of Spain, in Catalonia; 15 miles N.N.E. of Tortosa.

TIVIOT, a river of Scotland, which rises about 12 miles S.W. from Hawick, and runs into the Tweed, at Kelfoe. The valley which it waters is called *Tiviotdale*.

TIUKI-KARAGAN, a cape on the E. side of the Caspian sea; 156 miles S.E. of Astrachan. N. lat. 44° 20'. E. long. 50° 14'.

TIULIT, a town of Africa, in the kingdom of Fez; 12 miles S.W. of Fez.

TIUMEN, a town of Russia, in the government of Tobolsk, at the union of the Pischma and the Tura. This town is not built parallel to the river Tura, but at right angles with it; and the little river Pischma runs through the town, and falls into the Tura at the extremity of it. Over the river is a bridge of eighty-three fathoms in length; and a little below it stands a fort, built with stone, in which is a church of the same materials. Without this fortification, and towards the lower bank of the Tura, are six wooden

churches, a convent of nuns, with a church, and 500 dwelling-houses. At the lower end of the town is an ostrog. Beyond the Tumenka lies the Yamskaia sloboda, or suburb, consisting of 250 houses, inhabited by people of all ranks and professions; and at the extremity of this suburb stands a monastery: it has likewise three churches, built with stone. Another suburb lies opposite to Tiumen, on the N. side of the Tura, which is inhabited by Russians, Mahometan Tartars, and Bucharians; 112 miles W.S.W. of Tobolsk. N. lat. 57°. E. long. 65° 14'.

TIVOLI, anciently called *Tibur*, a town of the Pope-dome, in the Campagna di Roma, situated on a rocky mountain, planted with olive-trees, which are said to yield the best oil in Italy; the see of a bishop held immediately under the pope. The town itself is mean, and contains a great number of forges. The cathedral is built on the ruins of a temple of Hercules. In the market-place are two images of Oriental granite, representing Isis, the Egyptian deity. The principal beauty of this place arises from the river Tevereone, which falling headlong about fifty feet down the rock, forms a noble cascade, and several lesser ones, called Le Cascadelle. The latter are extremely picturesque; as is also a deep ravine in the hill, called La Grotta di Nettuno, into which the great cascade falls. To enrich the view, here are some remains of ancient buildings, as the villa of Mæcenus, and particularly the little round temple of the Sibyl, as it is commonly called, but rather of Vesta; one of the most elegant remains of the Grecian architecture. The naturalist will here take pleasure in observing the continual formation of new Tiburtine stone from the deposit of water descending from the calcareous Apennines; 15 miles E.N.E. of Rome. N. lat. 41° 58'. E. long. 12° 46'.

TIURANEN, a small island on the E. side of the gulf of Bothnia. N. lat. 65° 38'. E. long. 24° 46'.

TIUTERS, an island of Russia, in the gulf of Finland; 80 miles E.N.E. of Revel. N. lat. 59° 40'. E. long. 27° 14'.

TIVY, a river of South Wales, which rises about 5 miles N. from Tregaron, and runs into the sea about 5 miles below Cardigan.

TIXIER, JOHN, (Lat. *Ravifius Textor*), in *Biography*, a person of literary character in France, was lord of Ravify in the Nivernois, and educated in the college of Navarre at Paris, where he taught the belles-lettres, and whence issued many of his publications for the use of his students. In 1500 he was appointed rector of the university of Paris, and he died, as some say in the hospital, in 1522. His works are, "A Collection of Latin Letters," "Dialogues," "Poems," "Epigrams," "Orations," &c. in Latin, written in good style; "Officina, seu potius Naturæ Historia, &c." several times reprinted; "De Memorabilibus et claris Mulieribus, aliquot diversorum Scriptorum Opera," to which he has annexed the life of Joan of France, written by himself. Moreri.

TIZ, in *Geography*. See TIZZ.

TIZRI, in *Chronology*. See TISRÍ.

TIZZANO, in *Geography*, a town of the duchy of Parma, 13 miles S. of Parma.

TIZZONAIOS, in the *Glass Art*, are two apertures, one on each side of the working-furnace, by which a servitor night and day puts on coals to maintain the fire,

TLACOOZELOT, in *Zoology*. See OCELOT.

TLAM, or SLAM, in the *Alum-Works*, a word used by the workmen to express a sort of mud or foulness which does great hurt to the alum, rendering it foul and coarse. The slam is a muddy substance settling to the bottom of

the vessels; but in the boiling of the liquor it gives a reddish colour, and disorders the whole works when in any great quantity. They always pass their liquor over four parcels of the alum-rock, and the last, if not carefully calcined, generally gives it this disadvantageous mixture. Phil. Trans. N^o 142.

TLANHQUACHUL, in *Ornithology*, the name of a Brazilian bird, very much approaching to the nature of the European platea, or spoonbill.

It is a very voracious bird, and feeds on live fish, but will not take or meddle with dead ones, and is all over of a beautiful red. It has a black ring round the upper part of its neck, and is common about the shores of the sea and rivers.

TLAQUACUM, in *Zoology*, the name given by the Spaniards, and some others, to a very remarkable animal in America, commonly known among us by the name of the possum or opossum.

TLAQUATZIN, a name by which the natives in some parts of America call the opossum.

TLAQUATZIN *Spinosum*, the name by which Hernandez has called the cuanda, a sort of Brazilian porcupine.

TLASCALA, in *Geography*, a province of North America, in the government of Mexico; bounded on the N. by Guafteca, on the E. by the gulf of Mexico and the province of Guaxaca, on the S. by the Pacific ocean, and on the W. by the province of Mexico Proper; about 320 miles in length, and from 40 to 120 in breadth. The climate, soil, and produce, are much the same with those of Mexico Proper. On the W. side there is a chain of mountains for the space of eighteen leagues, very well cultivated; and on the N. is also a great ridge of mountains, covered with perpetual snow, the neighbourhood of which exposes it to horrid tempests, hurricanes, and frequent inundations, whereby houses, even on the top of eminences, are sometimes endangered. Yet this is allowed to be the most populous country of all America: and this is partly ascribed to its having been originally an ally to Cortez, in the conquest of Mexico, who obtained a grant of it from the emperor Charles VI. also king of Spain, by which it is still exempt from any service or duty whatsoever to that crown, only paying the king of Spain a handful of maize for each head, as an acknowledgment; which inconsiderable parcels were said, upwards of fifty years ago, to make up 13,000 bushels; for it produces so much of the Indian corn, that hence it had the name of Tlascala, that is, the Land of Bread. By this means the towns and villages swarm with Indians. This province was anciently a monarchy, till civil wars arising among the inhabitants, they formed themselves into an aristocracy of many princes, in order to get rid of one. They divided their towns into different districts; each of them nominated one of their chiefs to reside in the court of Tlascala, where they formed a senate, whose resolutions were a law to the whole. Under this form of government they maintained themselves a long while against the kings of Mexico, and continued in it till the reception of the Spaniards under Cortez.

TLASCALA, a town of North America, and anciently the capital of a province to which it gives name, situated on a river, which runs into the Pacific ocean. When the Spaniards first arrived here, it is said to have contained 300,000 inhabitants: and Acosta affirms, that it had a market-place large enough to hold 30,000 buyers and sellers; that in the shambles were seldom less than 1500 sheep, 4000 oxen, and 2000 hogs. But matters were so much altered, that Gemelli, who was here in 1698, says it was then become an ordinary village, with a parish-church, in which hangs up a

picture of the ship which brought Cortez to La Vera Cruz. The inhabitants formerly offered up human sacrifices, and when the Spaniards first arrived here, we are told by Diaz del Castillo, that they found wooden cages, in which prisoners were confined to be fatted for victims; 20 miles N. of Puebla de los Angeles. N. lat. 19° 45'. W. long. 98° 30'.

TLAYOTIC, in *Natural History*. See COLIC-Stone.

TLEMSAM, or TELEMTSEN, in *Geography*. See TREMECEN.

TLETSCHE, a town of Russia, in the government of Tobolsk, on the Irtysh; 72 miles E.S.E. of Tobolsk.

TLEUQUECHOLTOTOTL, in *Ornithology*, the Mexican name of a bird of the wood-pecker kind, described by Nieremberg under the name of the *avis salutiferus*; the feathers of a red crest it carries on its head being supposed a remedy for head-aches.

TLOS, in *Ancient Geography*, a town of Asia Minor, in Lycia, at the pass of a mountain, on the side of Cybara, according to Strabo. It is placed by Ptolemy in the number of the interior towns of Lycia, in the vicinity of mount Cragas.—Also, a town of Asia, in Pisidia.

TLUMACZOW, in *Geography*, a town of Moravia, in the circle of Hradisch; 15 miles N. of Hradisch.

TMAIE', a town of Egypt; 12 miles S.E. of an-fora.

TMARUS, in *Ancient Geography*, a mountain of Epirus, in Thesprotia, at the foot of which was a temple. Strabo. It was also called Tamarus and Tomarus.

TMATARACAN, or TAMATERCAN, literally denoting the "swarm of beetles," called in Theodosius's Itinerary "Tamatarce," a name anciently given to the city of Taman, over the suburbs of which extend all the ruins of the ancient city of Phanogoria. The distance across the Bosphorus from Tmataracan to Kertchy, *i. e.* from Phanogoria to Panticapæum, is found to correspond with the actual distance from Taman to Kertchy. Among other antiquities of Taman, one of the most remarkable is the Naumachia, or amphitheatre for naval combats, not less than 1000 paces in diameter, with its whole area paved. The subterraneous conduits for conveying water still remain, but are applied to other uses. The materials of the ruined buildings do not exist in the isle of Taman, but must have been brought from the Crimea, from Greece, or in later ages, by the Genoese from Italy. The distance from Taman to Yenikele, on the opposite shore, is about 12 miles. Clarke's Travels, vol. ii.

TMESCHUDE, or MUSCHUDE, a town of Germany, in the county of Arensburg, on the left side of the Roer; 3 miles N.W. of Arensburg.

TMESIPTERIS, in *Botany*, an uncouth, however learned, name, composed of *τμήσις*, a notch, or incision, and *πτερίς*, a fern, because the capsules are seated in the notches of the frond.—Bernhardi in Schrad. Journ. for 1800, 131. t. 2. f. 5. Willd. Sp. Pl. v. 5. 56. Swartz Fil. 187. Labill. Nov. Holl. v. 2. 105. t. 252. This fern is referred by Mr. Brown to *PSILOTUM*. (See that article.) We ought there to have noticed Mr. Brown's remark, that the plant of Forster differs from Labillardiere's, in not having abrupt leaves, and that it was found in New Zealand, not in the isle of Tanna. Willdenow has justly observed the difference between Bernhardi's figure, and that of Labillardiere. Mr. Brown says both these species are parasitical, on the stems of arborescent ferns.

TMESIS, *τμήσις*, formed from *τμήσις*, I cut, in *Grammar*, a figure by which a compound word is separated into two parts, and one or more words interposed between them.

Thus,

Thus, when Terence says, "quæ meo cunque animo libitum est facere," there is a tmefis; the word *quæcunque* being divided by the interposition of *meo*.

Lucretius abounds in tmefes; as "sæpe salutantum tactu præterque meantum;" or "diffidio potis est sejungi, seque gregari;" and "dispectis disque gregatis."

TMOLUS MOUNTAIN, in *Ancient Geography*, a mountain of Asia Minor, in Lydia. Strabo says that the town of Sardis was commanded by the Tmolus, a rich mountain, on the summit of which the Persians had erected a turret, from which might be seen all the adjacent fields, which were watered by the Cnystrus. According to Homer it obtained, from its extraordinary elevation, the name of Ventose, or windy. From Pliny we learn that the Pactolus, Chrysothoas, and the fountain Tarne, had their sources in this mountain, and that it produced excellent wine, highly commended by Pliny and Vitruvius. The summit is represented as always covered with snow. It was sometimes denominated Timolis, as by Ovid,

"Deserere sibi Nymphæ? . . . Timoli."

According to the mythologists, it was in this mountain that Apollo punished Midas, king of Phrygia, by giving him asses' ears.

TMOLUS, a town of Asia Minor, in Lydia, on mount Tmolus. According to Tacitus, Tmolus was one of the twelve towns overthrown by an earthquake, in the fifth year of the reign of Tiberius, A.D. 117, and it was rebuilt by this prince.

TMORUS, the name of one of the summits of the Ceraunian mountains, in Epirus.

TMULGA, in *Geography*, a town of Algiers; 10 miles E. of Sinaab.

TNYSSUS, in *Ancient Geography*, a town of Asia Minor, in Caria.

TOA, in *Geography*, a river of the island of Porto Rico, which runs into the harbour of Porto Rico.

TOAD, *Rubeta*, *Rana Bufo* of Linnæus, in *Zoology*, a creature sufficiently known. See **RANA**.

The toad has been generally considered as a poisonous animal, but Mr. Pennant apprehends without sufficient reason. They have been taken up in the naked hand without the least injury, and quacks have even eaten them, and drank their juices without damage. Besides, they are common food to many animals, as buzzards, owls, Norfolk plovers, ducks, and snakes; of late, indeed, live toads have been applied to cancers, with a view of curing them: facts have been alleged in proof of their efficacy for this purpose. The mode of applying them has been to put the animal into a linen bag, and to hold its head, pressing out of the bag, to the part, which it has soon laid hold of and sucked with greediness till it dropped off dead. The creature has swelled and appeared to be in great pain; often sweats much and turns pale; and sometimes disgorges, recovers, and becomes lively again. For other particulars, we must refer to Mr. Pennant's appendix *ubi infra*. The time when toads propagate is early in the spring; at which season the females are seen crawling about oppressed by the males, who continue on them for some hours, and adhere so fast as to tear the skin from the part to which they stick. They impregnate the spawn as it is drawn out in long strings, like a necklace. And the female is assisted by the male, in discharging the spawn, who with his hinder feet pulls out the eggs, whilst his fore-feet embraces her breast. The eggs are included each in a membranous coat that is very firm, in which is contained the embryo, and these eggs, fastened to one another by a short but strong cord, form a kind of chaplet, the

beads of which are distant from each other about half their length. The male, by drawing this cord with his paw, performs the functions of a midwife, and acquits himself in it, it is said, with a dexterity which could not be expected from so lumpish an animal. Pennant's Brit. Zool. vol. iii. p. 14. p. 385, &c.

The toad of Surinam, or *rana pipa* of Linnæus, has long been an object of attention to the curious, on account of its enormous bulk and ugly form. Dr. Fermin, in his "Traité des Maladies les plus fréquentes à Surinam," &c. published at Mæstricht in 1764, has given some remarks on its mode of generation. Having put three males and a female into an open vessel of water, he observed that one of them had several spots on its back, which were eggs, each containing an embryo. At the end of three weeks, the animal seemed much agitated, and one of the cells on his back bursting open, a young one crept out of it. In five days no less than thirty-five of these cells opened in the same manner and produced as many animals. On the back of one of these which was dissected, there were no less than one hundred and twenty of these cells, each of which he considers as a real matrix, in which its eggs are lodged and fecundated; and, indeed, in one of them he discovered an embryo completely formed, enveloped in a kind of placenta, accompanied by two thin transparent membranes, seemingly analogous to the chorion and amnios in other animals. For other species of toad, see **RANA**.

TOAD-FISH, *Rana piscatrix*, in *Ichthyology*. See **LOPHIUS Piscatrix**, and **SEA-DEVIL**.

TOAD-FLAX, in *Botany*. **ANTIRRHINUM**.

TOAD-STONE, in *Mineralogy*, a variety of trap-rock. (See **TRAP**.) The toad-stone of Derbyshire is generally a dark-brown basaltic amygdaloid, composed of an intimate intermixture of basalt and green earth, and containing oblong cavities, principally filled with calcareous spar. It sometimes assumes the form and texture of a compact basalt, and is also found in a decomposing soft state, approaching to clay. In composition and appearance it bears a strong resemblance to some volcanic rocks; and there are certain peculiarities in the geological position of this rock, which have excited considerable attention. Mr. Whitehurst, in his Theory of the Earth, has given a particular account of the Derbyshire toad-stone; and has stated the number of beds, and the thickness of each, with that of the mountain lime-stone, with which it alternates, as under:

First lime-stone	-	50 yards.
First toad-stone	-	16
Second lime-stone	-	50
Second toad-stone	-	46
Third lime-stone	-	60
Third toad-stone	-	22
Fourth lime-stone	-	not cut through.

It appears, however, that the thickness and extent of the toad-stone beds are by no means so regular as those of the other strata, in the same district.

In some situations, one or more of the beds will become very thin, or be entirely wanting; in other situations, a single bed will be found of vast thickness: and masses of this substance, which cannot be referred to any of the three beds, will be found interposed in the lime-stone strata. In some instances, particularly near Ashover, nodules of lime-stone may be seen imbedded in toad-stone. Farey's Derbyshire Report, vol. i. p. 276.

The most remarkable phenomenon which the beds of toad-stone present in Derbyshire, is the complete separation of the metallic veins which they generally occasion. The mountain lime-

lime-stone of that district is intersected by numerous perpendicular metallic veins, which rise from the lowest lime-stone to the uppermost; but on sinking through the vein in the first lime-stone, down to the first toad-stone, the vein will entirely disappear, but on perforating through the toad-stone, it will be found again in the second lime-stone; and the same appearances will be presented on piercing through the second and third beds of lime-stone, and the second and third beds of toad-stone. See *Plate IV. Geology, fig. 1.* where 1, 2, 3, 4, represent the four beds of lime-stone; b, b, b, the three beds of toad-stone; and v, v, v, the metallic vein passing through the different lime-stone beds, but completely cut off or separated by the intervening beds of toad-stone. To account for this interruption of the vein at v, v, v, Mr. Whitehurst supposes that the toad-stone, in a state of igneous fusion, has burst through the lower strata, and has forced itself between the strata of lime-stone by a lateral motion. Were this the case, we must admit that the toad-stone had risen through fissures or dikes, similar to what exist in many of the northern parts of Britain, and are called whin-dikes. The whin-stone, or basalt, bearing a close resemblance to toad-stone, and the strata in the peak of Derbyshire being much fractured, we should feel little difficulty in admitting the probability of Mr. Whitehurst's theory, did it apply to the different phenomena which these beds of toad-stone present. According to this theory, the beds of toad-stone must have been interposed subsequently to the formation of the metallic veins. There are, however, instances, in which very large veins extend from the lime-stone to some depth in the toad-stone, and terminate in small strings of ore; in other instances, though the ore is not continued through the toad-stone, a small vein filled with spar may be traced from No. 1. the first lime-stone, through b, to No. 2. the second lime-stone. Such instances prove, in the most decisive manner, that the formation of the veins was posterior to that of the toad-stone. Hence we are led to seek for some other cause which may explain the absence of metallic ores in the beds of toad-stone. This subject will be considered when we treat of metallic veins. See TRAP, and VEINS, *Mineral and Metallic.*

From the experiments of Dr. Withering on this stone with different acids, alkalies, and by fusion, it appears that one hundred parts of it consist of $63\frac{1}{2}$ parts of siliceous earth, 16 of calciferous iron, $7\frac{1}{2}$ of calcareous earth, and $14\frac{1}{2}$ of earth of alum. The aggregate of these ingredients is found to weigh $1\frac{1}{2}$ parts more than the original mass, which is ascribed to the substance capable of uniting with fixable air, not having been fully saturated with it, as they would be after their precipitation by the earth of alum. (Phil. Transf. vol. lxxii. part ii. p. 353.) This substance differs little from basalt: it is softer, contains a smaller proportion of iron, and a larger of silex.

TOAGAMALLY, in *Geography*, a town of Hindoostan, in the Carnatic; 17 miles W.S.W. of Tritchinopoly.

TOAHOUTA, one of the smaller Society islands, near Otaha.

TOAIREH, a town of Egypt, on the coast of the Red sea, where the water is salt; 3 miles N. of Kolzum.

TOALDO, JOSEPH, in *Biography*, a distinguished philosopher, was born in 1719 at a small village near Marostica, in the valley of Vicenza, at the foot of the Alps, and sent, in the year 1733, to the seminary of Padua, where he studied Latin, rhetoric, philosophy, theology, and particularly mathematics. In this seminary he afterwards became a teacher of grammar, rhetoric, philosophy, and mathematics. His first literary work was a new edition of

the writings of Galileo, to which he added several fragments never before published, with a preface and notes. For his services to the above-mentioned seminary he was recompensed with the benefice of Montegalda, which he enjoyed for 14 years, and which he exchanged for another more convenient, after his appointment by the senate of Venice, in 1762, to the professorship of astronomy and meteorology in the university of Padua. Here he constructed an observatory, begun in 1767 and completed in 1774. In 1769 he published at Padua a short view of plane and spherical trigonometry, entitled "Tavole Trigonometriche, &c." which was reprinted and used in many of the Italian seminaries. He next published a treatise on the influence of the heavenly bodies on the weather and atmosphere, containing the result of a long series of meteorological observations. This work, printed at Padua in 1770, 4to., was translated into different languages, and so well received, that he was admitted into various learned societies. About the same time he presented to the public essays in favour of electrical conductors, which caused them to be erected in the Venetian territories; also a chronological view of uncommon changes in the weather, with tables of the state of the barometer, and the flux and reflux of the sea. His meteorological journal was begun in 1773, and continued till his death. His celebrity was augmented in 1774 by an answer to a prize question, proposed by the academical society of Montpellier, on meteorology applied to agriculture; and after this time he laboured incessantly in diffusing meteorological science. In 1777 he translated Lalande's *Astronomical Tables*, and his "Abrégé de l'Astronomie;" and some time after, his "Astronomie des Dames;" erecting also in his observatory a marble bust of that eminent astronomer. From this time he almost restricted his attention to astronomy and meteorology, endeavouring to confirm his hypothesis of the influence of the moon on the different changes of the weather. He also published an historical view of the services rendered by the Venetian schools to astronomy, geography, and navigation. In 1783 he obtained, in conjunction with his nephew Chiminello, who was his assistant in the observatory, the prize offered for the best treatise on the construction of a comparative hygrometer; and in 1784 he published a small work on the longitude, which was well received. He proceeded regularly with his journal till the year 1787, when a small work in two sheets was printed at Venice; and in the following year his *Tables of Vitality* appeared at Venice and Padua. Of his travels in 1780 and in 1788, in the course of which he examined the place where Hannibal crossed the Alps, the result was inserted in his dissertation on the subject, printed in the fourth volume of the *Transactions of the Academy of Padua*. But our limits will not allow us to give even the titles of the numerous essays and papers which he published on various subjects, relating principally to meteorology. The journals of the period in which he lived contain many curious pieces contributed by this industrious inquirer into the operations and phenomena of nature. Besides his publications, he left in MS. several papers, and particularly observations on the travels of Marco Polo, and on the real epoch of the Chinese wall. The termination of Toaldo's life was accelerated by the chagrin which he felt, in consequence of a fruitless attempt to serve a young man who had been deprived of his office. This irritation affected his health, so that in November, 1797, he was attacked by a nervous affection, which in a few days proved fatal, in the 79th year of his age.

"Toaldo," says his biographer, "was of small stature; but, in general, had an engaging appearance that inspired confidence

confidence and respect. His deportment was easy, and in his conversation, which was lively, he displayed great knowledge, and an extensive acquaintance with various branches of science. Simple in his manners, open and sincere, he indulged only the milder passions; and seemed to have no other ambition than that of being useful. He was steady in his friendship; always ready to do good offices in the most disinterested manner, and indulgent towards every one around him. To the talents of a literary man, he added the virtues of the citizen; and therefore was universally esteemed, but particularly by those who enjoyed his more intimate acquaintance." Phil. Mag.

TOALLOOR, in *Geography*, a town of Hindoostan, in Baramaul; 3 miles S.E. of Wombinellore.

TOAMENSING, a township of Pennsylvania; 50 miles N. of Philadelphia.—Also, a township of Pennsylvania; 15 miles N. of Philadelphia.

TOANA, in *Ancient Geography*, a town of India, on this side of the Ganges, east of this river, among the people called Nanichæ. Ptol.

TOANI, a people of Arabia Felix, in the environs of the strait of the Arabic gulf. Pliny.

TOB, or **TUBIA**, a country on the other side of Jordan, in the northern part of the tribe of Manasseh. It was the country into which Jephtha retired, as we read in the book of Judges.

TOBA, in *Geography*, a small island in the East Indian sea, near the west coast of Aroo. S. lat. 5° 8'. E. long. 135° 9'.

TOBACCO, **NICOTIANA**, in *Botany*. See **NICOTIANA**.

TOBACCO, *Culture and Preparation of*. See **NICOTIANA**.

TOBACCO, *History of*. Tobacco was not known in Europe till after the discovery of America by the Spaniards, and first imported about the year 1560, as some say by sir Francis Drake.

The Americans of the continent call it *petun*, those of the islands *yoli*. The Spaniards, who gave it the name *tobacco*, took it from Tabaco, a province of Yucatan, where they first found it, and first learned its use; or, as some say, it derived its name from the island of Tabago, or Tobago.

The French, at its first introduction among them, gave it various names; as *Nicotiana*, or the *ambassador's herb*, from John Nicot, then ambassador of Francis II. in Portugal; who brought some of it with him from Lisbon, and presented it to a grand prior of the house of Lorraine, and to queen Catherine de Medicis; whence it was also called *queen's herb*, and *grand prior's herb*. They also gave it other names, which are now all reduced to the original name of *tobaco*, or *tobacco*, from *Tabaco*, given it by Hernandez de Toledo, who first sent it into Spain and Portugal.

It appears from Lobel, that this plant was cultivated in Britain before the year 1570; and the introduction of the practice of smoking it in England has been commonly ascribed to sir Walter Raleigh, about the year 1584. The cultivation of it is now common in various parts of the globe; and though prohibited by the laws of this country, the manufacture of it forms no inconsiderable branch of commerce.

Tobacco might be cultivated with advantage through the greater part of Europe; but almost in every part of Europe it has become a principal subject of taxation; and it has been supposed, that it would be more difficult to collect a tax from every farm where this plant might happen to be cultivated, than to levy one upon its importation at the custom-house. The cultivation of tobacco has been, upon

this account, most absurdly, (says Mr. Smith, *Wealth of Nations*;) prohibited through the greater part of Europe, which necessarily gives a sort of monopoly to the countries where it is allowed; and as Virginia and Maryland produce the greatest quantity of it, they share largely, though not without some competitors, in the advantage of this monopoly: the cultivation of it, however, is said to be less profitable than that of sugar. At the time when the author published his work above cited, about ninety-six thousand hogheads of tobacco were annually purchased in Virginia and Maryland, with a part of the surplus produce of British industry; but the demand of Great Britain does not require, perhaps, more than fourteen thousand. If the remaining eighty-two thousand, therefore, could not be sent abroad and exchanged for something more in demand at home, the importation of them must cease immediately, and with it the productive labour of all those inhabitants of Great Britain, who are at present employed in preparing the goods with which these eighty-two thousand hogheads are annually purchased. Those goods, which are part of the produce of the land and labour of Great Britain, having no market at home, and being deprived of that which they had abroad, must cease to be produced. The most round-about foreign trade of consumption, therefore, may, upon some occasions, be as necessary for supporting the productive labour of the country, and the value of its annual produce, as the most direct. In order to facilitate the great exportation which was necessary, for getting rid of that which remained after the home consumption, the whole duties were drawn back, provided the exportation took place within three years.

The principal kinds of tobacco imported into England are, as we have already observed, the Maryland, called Oroonoko, and the Virginia-tobacco. The former is not so agreeable to the British taste as the sweet-scented tobacco of the latter country; but the northern nations of Europe are said to like it better.

Besides the tobacco of the West Indies, there are considerable quantities cultivated in the Levant, the coasts of Greece, and the Archipelago, the island of Malta, and Italy. The marks of good twist tobacco are a fine shining cut, an agreeable smell, and that it has been well kept.

In the island of Ceylon, there are two kinds of tobacco cultivated for profit. They call both kinds *dunkol*, which signifies a leaf, the use of which is to be smoked. The one kind they call *hingele dunkol* or *singele dunkol*, for they make no difference between the letter S and H in their pronunciation; the other they call *dunkol kappada*; *kappada* signifies gelding, and is a word of Portuguese origin. This *kappada* tobacco is much stronger and more intoxicating than the other; but both kinds are the produce of the same plant; only the single tobacco has very little care taken of it, being, after the sowing, in a manner left to itself; while the other has great pains bestowed upon it during the whole time of its growth, and till it is fit for use.

Some of the Ceyloneses chew this strong tobacco with their betel; and some, who smoke it alone, use no pipe, but, taking a long leaf of it, they roll it up into a long form, and cover it with the leaf of the wattukan-tree; they then light one end of it, and smoke by the other, till the whole is consumed. Phil. Trans. N° 278, p. 1143.

Although in Russia tobacco is not considered as one of the general necessaries of the lower classes of the people, the practice of smoking having been held as a sin to the end of the 17th century; nevertheless the consumption of it is by no means small, and of course the importation always much overbalances the exports. In 1793, the former at St.

TOBACCO.

Petersburg alone amounted to upwards of 47,000 rubles; and the latter, from all parts of the empire, barely to 20,000: however, the consumption must have increased, as the exportation in 1768 is stated by Guldenstædt at 21,000, and the whole of the importation at 108,000 rubles. The culture has been profitably carried on, since the year 1763, in various districts of the empire. Most of it is obtained in the Malo-Russian governments, where the cultivation was first encouraged; but it has been much cultivated in other regions, *e. g.* about the Volga and the Samara, and particularly by the Cossacks on the Orenburg and Siberian lines. The greater part of the Russian tobacco is derived from American, and some Turkish and Persian seed. In the generality of the southern governments, these plantations admit of being greatly multiplied. The different sorts of tobacco and snuffs prepared from it, which are now in use, are to be attributed to the difference of the climate and soil in which it grows, and the peculiar mode of managing and manufacturing the plant, rather than to any essential difference in its qualities.

TOBACCO, in the *Materia Medica*, &c. This is a well-known drug of a narcotic quality, which it discovers in all persons, even in small quantity, when first applied to them; and when used in large quantities, its effects have sometimes been more violent, so as to have proved a mortal poison. Besides its narcotic qualities, it possesses also a strongly stimulant power, perhaps, as Dr. Cullen observes, with respect to the whole system, but especially with respect to the stomach and intestines; so as readily, even in no great doses, to prove emetic and purgative.

The leaves of tobacco have a strong disagreeable smell, and a very acrid burning taste: distilled in a retort, without addition, they yield an acrid, empyreumatic, poisonous oil. They give out their acrid matter both to water and spirit, but most perfectly to the latter: the aqueous infusions are of a yellow or brown colour, the spirituous of a deep green. The several sorts of tobacco imported from abroad are stronger in taste than that of our own growth, and the extracts made from them much more fiery, but in less quantity.

Tobacco has been employed, in ordinary use, by snuffing, smoking, and chewing; and these practices have been common for more than 200 years to all Europe, and they have more or less prevailed in other parts of the globe. Like other narcotics, the use of it may be introduced by degrees; and its peculiar effects may hardly at all be manifested; but beyond certain limits, violent effects have been sometimes produced on those who have been accustomed to the use of it. The power of habit is often unequal, even among those who have been addicted to this practice. Dr. Cullen mentions a lady, who had been for more than twenty years accustomed to take snuff at all times of the day; but she found at length that indulging much in the use of snuff before dinner took away her appetite; and in process of time, that a single pinch, taken any time before dinner, palled her appetite for that meal. But when she abstained from the use of it, her appetite returned; and after dinner, for the rest of the day, she took snuff freely without inconvenience. When snuff, that is, tobacco in powder, is first applied to the nose, it proves a stimulus, and excites sneezing; but by repetition, that effect entirely ceases.

Snuff, when first employed, if it be not taken in small quantity, and if it be not thrown out immediately by sneezing, occasions some giddiness and confusion of head: but these effects do not occur when persons are habituated to the use of it. But such persons, if it be taken beyond the usual quantity, experience the same consequences; and

the effect is manifest, not only on the sensorium, but on other parts of the system, particularly the stomach, occasioning a loss of appetite, and other symptoms of a weakened tone in that organ. Dr. Cullen says, that he has observed several instances of persons who take snuff to excess, suffering from it by a loss of memory, by a fatuity, and by other symptoms of the weakened or senile state of the nervous system, induced before the usual period. He has also found symptoms of dyspepsia, and pains of the stomach, occurring every day, in consequence of excess in the practice of taking snuff. These symptoms have subsided, when the use of snuff has been discontinued. A special effect of snuffing, he says, is its exciting a considerable discharge of mucus from the nose; and there have been several instances of head-aches, tooth-aches, and ophthalmias thus relieved; and when this discharge of mucus is considerable, the ceasing or suppression of it, by abstaining from snuff, is apt to occasion those disorders which it had formerly relieved. Another effect of taking snuff is this, that as a part of the snuff is often carried back into the fauces, so a part of this is carried down into the stomach, and then more certainly produces the above-mentioned dyspeptic symptoms.

Smoking, when first practised, shews very strongly the narcotic, vomiting, and even purging powers of tobacco, and it is very often useful as an anodyne; but by repetition these effects disappear, or only shew themselves when the quantity smoked is beyond what habit had before admitted of; and even in persons much accustomed to it, it may be carried so far as to prove a mortal poison. From much smoking, all the same effects may arise which we said might arise from the excess in snuffing.

With respect to the evacuation of mucus which is produced by snuffing, there are analogous effects produced by smoking, which commonly stimulate the mucous follicles of the mouth and fauces, and particularly the excretories of the salivary glands. By the evacuation from both sources, with the concurrence of the narcotic power, the tooth-ache is often greatly relieved by it; but we have not found the smoking relieve head-aches and ophthalmias so much as snuffing often does. Sometimes smoking dries the mouth and fauces, and occasions a demand for drink; but, as commonly the stimulus it applies to the mucous follicles and salivary glands draws forth their liquids, it occasions on the other hand a frequent spitting.

So far as this is of the proper saliva, it occasions a waste of that liquid so necessary in the business of digestion; and both by this waste, and by the narcotic power at the same time applied, the tone of the stomach is often weakened, and every kind of dyspeptic symptoms is produced. Though in smoking a great part of the smoke is again blown out of the mouth, still a part of it must necessarily pass into the lungs, and its narcotic power applied there often relieves spasmodic asthma; and by its stimulant power it there also sometimes promotes expectoration, and proves useful in the catarrhal or pituitous difficulty of breathing.

Smoking has been frequently mentioned as a means of guarding men against contagion. In the case of the plague, the testimony of Diemerbroeck is very strong; but Rivinus and others give us many facts which contradict this; and Chenot gives a remarkable instance of its ineffectuality. We cannot indeed suppose that tobacco contains an antidote of any contagion, or that in general it has any antiseptic power; and therefore we cannot allow that it has any special use in this case: but it is very probable that this and other narcotics, by diminishing sensibility, may render men less liable to contagion; and by rendering the mind less active and anxious, it may also render men less liable to fear, which

has

TOBACCO.

has so often the power of exciting the activity of the contagion. The antiloinic powers of tobacco are therefore on the same footing with those of wine, brandy, and opium.

The third mode of using tobacco is that of chewing it, when it shews its narcotic qualities as strongly as in any other way of applying it; though the nauseous taste of it commonly prevents its being carried far in the first practice. When the practice, however, is continued, as it is very difficult to avoid some part of it dissolved in the saliva from going down into the stomach, so this, with the nausea excited by the taste, makes vomiting more readily occasioned by this than the other modes of applying it. They are the strong, and even disagreeable impressions repeated, that give the most durable and tenacious habits; and therefore the chewing of tobacco is apt to become one of these: and it is therefore in this way that it is ready to be carried to the greatest excess, and to shew all the effects of the frequent and large use of narcotics. As it commonly produces a considerable evacuation from the mouth and fauces, so it is the most powerful in relieving the rheumatic affection of tooth-ache. This practice is also the occasion of the greatest waste of saliva; and the effects of this in weakening digestion, and perhaps from thence especially, its noted effect of producing emaciation, may appear.

The effects already recited of the different modes of employing tobacco depend especially upon its narcotic power, and certain circumstances accidentally attending its application to the nose and mouth: but as we have observed before, that beside its narcotic, it possesses also a stimulant power, particularly with respect to the alimentary canal: by this it is frequently employed as a medicine for exciting either vomiting or purging, which it does as it happens to be more immediately applied to the stomach or to the intestines.

An infusion of from half a drachm to a drachm of the dried leaves, or of these as they are commonly prepared for chewing, for an hour or two, in four ounces of boiling water, affords an emetic which has been employed by some practitioners, but more commonly by the vulgar only. As it has no peculiar qualities as an emetic, and its operation is commonly attended with severe sickness, it has not been, nor is it likely ever to come into common practice with physicians.

By long boiling in water, its deleterious power is said to be abated, and at length destroyed: an extract made by long coction, is recommended by Stahl and other German physicians, as the most effectual and safe aperient, detergent, expectorant, diuretic, &c.; but the medicine must necessarily be precarious in strength, and has never come into use among us. Lewis Mat. Med.

It is more commonly employed as a purgative in glysters; and, as generally very effectual, it is employed in all cases of more obstinate costiveness; and its powers have been celebrated by many authors. Dr. Cullen has known it to be in frequent use with some practitioners: and he adds, it is indeed a very effectual medicine, but attended with this inconvenience, that when the dose happens to be in any excess, it occasions severe sickness at the stomach, and it has been known to frequently occasion vomiting.

A strong decoction of tobacco, with proper carminatives and cathartics, given glyster-wise, sometimes proves of good effect in what is usually called the stone colic, and also in the iliac passion.

It is well known, that in cases of obstinate costiveness, in ileus and incarcerated hernia, the smoke of burning tobacco has been thrown into the anus with great advantage. The smoke operates here by the same qualities that are in the infusions of it above-mentioned: but as the smoke reaches

much farther into the intestines than injections can commonly do, it is thereby applied to a larger surface, and may therefore be a more powerful medicine than the infusions. In several instances, however, says Dr. Cullen, I have been disappointed of its effects, and have been obliged to have recourse to other means.

Bates and Fuller give some receipts, in which tobacco is an ingredient, with mighty encomiums, in asthmatic cases.

Hoffman observes, that horses have been often relieved by this remedy, but in human subjects it has been rarely tried; and says he has known some of the common people, who laboured under excruciating pains of the intestines, freed in an instant from all pain by swallowing the smoke. Both the decoction and the smoke have not unfrequently been injected in cases of incarcerated hernia, and often with success. The smoke thus applied is recommended as one of the principal means for the revival of persons apparently dead from drowning or other sudden causes; but some suspect the narcotic power of tobacco as unfavourable in these cases.

The infusion of tobacco, when it is carried into the blood-vessels, has sometimes shewn its stimulant powers exerted in the kidneys; and very lately we have had it recommended to us as a powerful diuretic of great service in dropsy. Upon the faith of these recommendations we have now employed this remedy in various cases of dropsy, but with very little success. From the small doses that are proper to begin with, we have hardly observed any diuretic effects; and though from larger doses they have in some measure appeared, we have seldom found them considerable: and when, to obtain these in a greater degree, we have gone on increasing the doses, we have been constantly restrained by the severe sickness at stomach, and even vomiting, which they occasioned: so that we have not yet learned the administration of this remedy, so as to render it a certain or convenient remedy in any cases of dropsy.

Tobacco is sometimes employed externally in unguents and lotions, for cleansing foul ulcers, destroying cutaneous insects, and other like purposes: it appears to be destructive to almost all kinds of insects, to those produced on vegetables as well as on animals. Lewis.

A strong decoction of the stalks, with sharp-pointed dock, and alum, is said to be of good service, used externally, in cutaneous distempers, especially the itch: some boil them for that purpose in urine. The same decoction is said to be infallible in curing the mange in dogs.

Tobacco beat into a mash with vinegar or brandy, and laid on the stomach, has sometimes good effects in removing hard tumours of the hypochondria. We have the history of two cures made by such applications in the Med. Eff. Edinb. vol. ii. p. 41.

The juice of this plant is said to be good against ulcers and mortifications. Boyle's Works, Abr. vol. i. p. 56.

Some caution, however, Dr. Lewis observes, is requisite even in the external uses of tobacco, particularly in solutions of continuity: there are instances of its being thus transmitted into the blood, so as to produce violent effects.

A drop or two of the chemical oil of tobacco being put on the tongue of a cat, produces violent convulsions, and death itself in the space of a minute; yet the same oil used in lint, and applied to the teeth, has been found of service in the tooth-ache; though it must be to those that have been used to the taking of tobacco, otherwise great sickness, retching, vomiting, &c. happen; and even in no case is the internal use of it warranted by ordinary practice. See experiments on the effects of oil of tobacco on pigeons, by M. Fontana, in which he found vomiting to be a constant effect of this poison, as he calls it, and the loss of motion

TOBACCO.

in the part to which it is applied an occasional or accidental effect, in Phil. Trans. vol. lxx. part i. append. p. 38, or Fontana fur les Poisons, &c. Florence, quarto.

In cases of obstinate ulcers, the infusion has been employed as a lotion with advantage; but the many instances of its being absorbed, and thus proving a violent poison, dissuade from the practice; especially as there are other medicines of greater efficacy, that may be used more safely. Bergius recommends it to be employed as a fomentation in the paraphymosis.

Sim. Paulli, physician to the king of Denmark, in an express treatise on tobacco, observes, that the merchants frequently lay it in bog-houses, to the end that, becoming impregnated with the volatile salt of the excrements, it may be rendered the brisker, more fetid, and stronger.

Amurath IV. emperor of the Turks, the grand duke of Muscovy, and the emperor of Persia, have prohibited the use of tobacco in their states. Our king James I. wrote a treatise expressly against it, entitled "A Counterblast to Tobacco." By a bull of pope Urban VIII. such are excommunicated as take tobacco in churches.

TOBACCO, Laws and Regulations concerning.—Tobacco is not to be planted in England, on forfeiture of 40s. for every rod of ground thus planted; but this shall not extend to hinder the planting of tobacco in physic gardens, in quantities not exceeding half a pole of ground, and also on forfeiture of 10l. for every rod. (15 Car. II. c. 7. 12 Car. II. c. 34.) And justices of peace have power to issue warrants to constables, to search after and examine whether any tobacco be sown or planted, and to destroy the same, which they are to do under penalties, &c. 22 & 23 Car. II. c. 26. 5 Geo. c. 11.

The act of 29 Geo. III. c. 68. regulating the importation, exportation, and manufacture of tobacco and snuff, and also that of 30 Geo. III. c. 40. made to explain and amend the former, are so extended, and comprehend so great a variety of particular regulations, as not to admit of minute recital in this place. The former repeals a considerable number of preceding statutes. By 49 Geo. III. c. 68. and c. 69. all duties under the respective departments of Customs and Excise are repealed, and other duties are granted in lieu of them. Tobacco and snuff are also subject to annual duties by the act for continuing the duties on pensions, offices, &c.; and certain drawbacks are allowed upon the exportation of them: which duties are to be under the management of the commissioners of the customs and excise. 43 Geo. III. c. 68. and c. 69.

No tobacco shall be imported but from America, on pain of forfeiture, with the vessel and its contents; except from Spain, Portugal, and Ireland, from which it may be imported under certain regulations. (29 Geo. III. c. 68.) But tobacco of the territories of Russia or Turkey may be imported from thence in British-built ships, and warehoused, and may be exported or entered for home consumption, on payment of the like duties as tobacco of the United States of America; and on its being manufactured in Great Britain and exported shall be entitled to the drawbacks. (43 Geo. III. c. 68.) By 45 Geo. III. c. 57. tobacco, the production of the West Indies or the continent of America, belonging to any foreign European state, may be imported into certain ports specified in the act, and exported to any port of the united kingdom, subject to the regulations of the act; and such tobacco shall pay the same duties as that which is the growth of the British West Indies, or of the United States of America. By 49 Geo. III. c. 25. unmanufactured tobacco may be imported from any place in British vessels navigated according

to law, or in foreign ships navigated in any manner whatever belonging to any states in amity with Great Britain; and such tobacco shall be liable to the same regulations as tobacco from the British plantations.

But no tobacco or snuff shall be imported in any vessel of less burthen than 120 tons; nor any tobacco-stalks, tobacco-stalk flour, or snuff-work, in any vessel whatever; nor any tobacco or snuff in casks less than 450lbs. on the like penalty; except loose tobacco for the crew, not exceeding 5lbs. for each person; nor shall the vessel be forfeited, if proof be made from the smallness of the quantity that such tobacco or snuff was on board without the knowledge of the owner or master. 29 Geo. III. c. 68.

And no tobacco or snuff shall be imported except at London, Bristol, Liverpool, Lancaster, Cowes, Falmouth, Whitehaven, and Hull (and by 31 Geo. III. c. 47. Newcastle-upon-Tyne); on the like forfeiture.

Every manufacturer of tobacco or snuff shall take out a licence from the officers of excise, for which he shall pay, if the quantity of tobacco and snuff-work, weighed by him for manufacture within the year, ending the 10th of October previous to his taking out such licence, did not exceed - - - - - 20,000lbs. £ s. d.
 2 0 0
 If above 20,000 and not exceeding 30,000 3 0 0
 30,000 - - - 40,000 4 0 0
 40,000 - - - 50,000 5 0 0
 50,000 - - - 60,000 6 0 0
 60,000 - - - 70,000 7 0 0
 70,000 - - - 80,000 8 0 0
 80,000 - - - 90,000 9 0 0
 90,000 - - - 100,000 10 0 0
 100,000 - - - 120,000 12 0 0
 120,000 - - - 150,000 15 0 0
 150,000 - - - - 20 0 0

Every person who shall first become a manufacturer of tobacco or snuff, shall pay for every such licence 2l., and within ten days after the 10th of October next after taking out such licence, such further additional sum, as with the said 2l. shall amount to the duty herein before directed to be paid, according to the quantity of tobacco and snuff-work weighed for manufacture within the preceding year - - - - - 2 0 0 and a surcharge.

And every dealer in tobacco and snuff shall take out a licence in like manner, for which he shall pay, within the liberties of the chief office in London, 5s., elsewhere 2s. 6d. 43 Geo. III. c. 69. Sched. (A.)

But persons licensed as manufacturers, who shall not sell tobacco in a less quantity than four pounds, nor snuff in two pounds, need not be licensed as dealers. 29 Geo. III. c. 68.

Every person who shall manufacture or deal in tobacco or snuff without taking out such licence; or shall not renew the same ten days at least before the end of the year, shall forfeit, if a manufacturer, 200l., and if a dealer, 50l.

But no person shall be liable to the said penalty of 50l. for selling unmanufactured tobacco or snuff, whilst remaining in the king's warehouse.

But persons in partnership need not take out more than one licence for one house.

Every person who shall manufacture tobacco, tobacco-stalks, or returns of tobacco, or flatten any tobacco-stalks,

TOBACCO.

or cut the same into Spanish, shall be deemed a manufacturer of tobacco. And every person who shall grind or manufacture any tobacco-stalk flour, snuff-work or snuff, shall be deemed a manufacturer of snuff. And every person who shall sell any tobacco, tobacco-stalks, or returns of tobacco, or stalks flattened or cut into Spanish, shall be deemed a dealer in tobacco. And every person who shall sell any tobacco-stalk flour, snuff-work or snuff, shall be deemed a dealer in snuff, within the meaning of this act.

Every manufacturer and dealer shall make entry in writing of his house or place intended to be made use of for manufacturing, keeping, or felling tobacco or snuff, three days before he shall begin, on pain of forfeiting 200*l.*, and also the tobacco and snuff there found, together with the casks and package, which may be seized by the officers of the customs or excise.

Every manufacturer, within the limits of the head office, must be an occupier of a tenement of 10*l.* a-year, and pay to the parish rates; elsewhere, he must pay to the church and poor.

Every such manufacturer shall, three days before he begins, make entry in writing at the excise-office of all mills, presses, engines, rollers, stoves, mullers, or spinning-wheels, intended to be used by him about the manufacturing of tobacco or snuff; on pain of forfeiting 50*l.* for every such utensil not entered.

Every such manufacturer and dealer shall cause to be put up in large legible characters over his door, or on some conspicuous part of such house or place, the words *Manufacturer of, and Dealer in Tobacco and Snuff, or Tobacco or Snuff, or Manufacturer of, or Dealer in Tobacco and Snuff, or Tobacco or Snuff* (as the case may be); on the penalty of 50*l.*

If any person, who has not made such entry as aforesaid, shall put up the said words, he shall forfeit 100*l.*

And by 30 Geo. III. c. 40. no person shall set up or begin any manufactory of tobacco or snuff within five miles of the sea-coast, except in the ports and places aforesaid, where tobacco may be imported, or places within three miles thereof; or in cities, or the suburbs thereof, and market-towns; and no entry thereof shall be of any avail. But the same shall not extend to places duly entered before the 5th of July, 1789.

But tobacco and snuff may be manufactured by any unlicensed Spanish cutter or snuff-miller at any entered mill, on account of any licensed manufacturer, provided the same be legally permitted from such manufacturer, and for the sole purpose of manufacturing or grinding. 29 Geo. III. c. 68.

Every manufacturer shall give notice in writing to the officers (if in London six, in cities and market-towns twelve, and elsewhere twenty-four hours), before he shall begin to strip, spin, or press any tobacco for cutting; or make any tobacco into carrots, or flatten any stalks for Spanish; and shall express therein the weight of each article, and the time he intends to begin: and the officer shall attend accordingly, and he shall begin within one hour of the time so mentioned, and shall proceed without delay; and shall afterwards deliver a declaration in writing to such officer, of the quantity intended to be used for each sort of tobacco; on the penalty of 20*l.* and such notice being void. 30 Geo. III. c. 40.

Provided, that if such tobacco shall afterwards appear to be unfit for the purpose specified in such declaration, it may be applied to any other purpose, on giving 48 hours' notice to the officer of the sort it is intended for. 29 Geo. III. c. 68.

Such manufacturer, as soon as the manufacturing is finished, shall deliver to the officer a declaration of the weight of the different sorts of tobacco so manufactured, and the number of the rolls or carrots made, and the weight thereof, and of the tobacco-stalks and returns arising from the operation; and shall keep each sort separate for twenty-four hours, or until an account be taken; on the penalty of 50*l.*

If any manufacturer shall make, or have in his possession, any roll or carrot tobacco for exportation, which shall have any tobacco-stalks therein, the same shall be forfeited, and may be seized, and he shall also forfeit 50*l.*

Every person who shall cut any walnut-tree, or other leaves, herbs, or plants, in imitation of tobacco (not being tobacco-leaves or plants); or shall colour the same so as to resemble tobacco; or shall mix any such leaves, herbs, or plants with tobacco; or shall sell, or expose to sale, or have in his possession any such leaves, herbs, or plants so cut, coloured, or mixed, shall forfeit the same with the casks and package, which may be seized; and also 200*l.*

Provided, that nothing herein shall extend to prohibit any such manufacturer from dyeing tobacco, or for having such dye in his possession for that purpose. 30 Geo. III. c. 40.

Every manufacturer of snuff shall provide proper moveable casks for preparing, laying down, or putting into bins snuff-work and tobacco-stalks for flour; and shall place them so as that the officer may conveniently examine and weigh the same at all times; and shall mark every such cask with a progressive number, and the tare and weight thereof; and shall not lay down any snuff-work in any cask not so marked; nor put the same in any bin; on the penalty of 50*l.* 29 Geo. III. c. 68.

Such manufacturer of snuff shall, before he begins to liquor, or cut any tobacco or stalks, &c. or to lay down any snuff-work, give like notice as aforesaid to the officer, and shall in such notice declare the weights thereof respectively, and the number of each particular cask or bin in which the same is intended to be laid down; and such officer shall attend accordingly; and such person shall begin within one hour of the time so mentioned, and shall without delay proceed therein, until the whole is weighed; and shall then deliver an account in writing of the quantity intended for each sort of snuff or flour; and when put into casks, he shall give a like notice, and in the presence of the officer shall affix to each cask a ticket specifying the number of such cask, and the weight of the snuff-work, &c. therein, and the time when laid down, and what sort of snuff it is intended for; which ticket shall be signed both by such manufacturer or his servant and the officer; and when the same is intended to be taken out to be ground, like notice shall be given, and the same shall be weighed out in the presence of the officer. And no such manufacturer shall mix snuff-work or tobacco-stalks for flour of one making with another; on pain of forfeiting for every offence aforesaid 50*l.*

Provided always, that if such snuff-work shall afterwards appear to be unfit for the purposes specified in such declaration, or be intended to be manufactured contrary thereto, notice thereof in writing shall be given to the officer within forty-eight hours after the delivery of such declaration, and a fresh declaration shall be given, specifying the sort it is intended for, and such manufacturer shall proceed therein in manner as aforesaid. 30 Geo. III. c. 40.

Scotch snuff and tobacco-stalk flour may be manufactured into brown Scotch snuff, and tobacco-stalk flour into rappee snuff, subject to the regulations aforesaid. And on taking stock,

TOBACCO.

stock, certain credits shall be allowed, as set forth in the act; and if on taking such stock any excess be found, the same shall be forfeited, and may be seized. 30 Geo. III. c. 40.

And to snuff-work in operation, tobacco, tobacco-stalks, or flour, or returns of tobacco, may be added, on giving to the officer, previous to such increase being made a like notice, and conforming to the regulations specified in the act.

The whole of any parcel of snuff-work in cure, may be mixed with the whole of any other parcel in cure, although laid down at different times, if the same be mixed in the presence of an officer, to whom notice is to be given as aforesaid.

If any manufacturer has occasion to supply his customers with manufactured tobacco or snuff from any parcel in operation, before the whole is finished, he may, in the presence of an officer, take for the purpose aforesaid any manufactured tobacco or snuff not less than 200lbs. But if taken without conforming to the regulations specified in the act, he shall forfeit 50*l*.

And every manufacturer shall diligently manufacture such snuff-work, and stalks for flour, when taken out of such cask, according to the notice given; and when the same is finished, he shall deliver to the officer a declaration in writing of the weight of each sort so made, and shall keep the same separate for twenty-four hours, or until the officer shall have taken an account thereof; on the penalty of 50*l*. 29 Geo. III. c. 68.

Every manufacturer may have a store-room for keeping dried Scotch snuff, but the same shall have but one door or opening, which shall be locked up, sealed, and secured by the officer; wherein may be deposited Scotch snuff returned directly from the mill for six months, without being taken as part of his stock. And when the same is intended to be taken out of such room, notice shall be given to the officer, who shall attend and open such room, and such snuff shall be taken out in his presence; and shall be kept separate one making from another; on the penalty of 50*l*. And if any such manufacturer shall open such store-room, except in the presence of an officer, he shall forfeit 20*l*.

Every person, who shall cut any walnut, hop, sycamore, or other leaves, or any other herbs, plants, or materials (not being tobacco-leaves or plants); or shall colour or cure any such, to make the same resemble tobacco; or shall sell the same, mixed or unmixed, for tobacco;—shall forfeit 5*s*. a pound, half to the king (charges of the prosecution first deducted), and half with full costs to him who shall sue. 1 Geo. I. st. 2. c. 46.

Every person who shall make, mix, or colour any snuff with ochre, amber, or other colouring, except water tinged with Venetian red only; or shall mix with snuff any fustic or yellow ebony, touchwood, or other wood, or any dirt, sand, or small tobacco sifted from tobacco,—shall forfeit the same, and 3*l*. for every pound weight, half to the king, and half to him that shall sue. 1 Geo. I. st. 2. c. 46. 5 Geo. I. c. 11.

And all such leaves and other materials, and all engines, utensils, and tools for working the same, may be searched for and seized, by warrant of three commissioners of the treasury or of the customs. 1 Geo. I. st. 2. c. 46.

If any person shall mix any fustic, or other wood, or any leaves, herbs, or plants (other than tobacco), or any earth, clay, or tobacco-sand, with any snuff-work or snuff; or shall colour the same with any sort of colouring (water tinged with colour only excepted); he shall forfeit 200*l*. And if any manufacturer or dealer in snuff shall sell, or ex-

pose to sale, or have in his entered premises, any fustic, yellow ebony, touchwood, logwood, red or Guinea wood, Braziletto or Jamaica wood, Nicaragua wood, or Saunders wood; or any walnut-tree, hop, or sycamore-leaves; or shall have in his possession any of the aforesaid articles; or any other wood, leaves, herbs, plants, earth, clay, or tobacco-sand, mixed with any snuff-work or snuff; or such snuff-work or snuff-coloured (except as aforesaid); he shall forfeit 50*l*., and the same shall be forfeited, and may be seized. 29 Geo. III. c. 68.

Any manufacturer of British rappee, Scotch or brown Scotch snuff completely finished, and of which an account has been taken by the officer, may liquor the same, before mixing with snuff of a different making, so as it exceed not the legal credit. And if such manufacturer shall intend to liquor snuff, for which the legal credit has not been received, he shall give notice thereof to the officer. But no snuff shall be liquored in less parcels than 200lbs., nor in more than four different parcels of one making. 30 Geo. III. c. 40.

Snuff, for which such allowance shall have been made, shall be kept separate from all other snuff, and shall be shewn to the officer on demand; on the penalty of 20*l*.

Every manufacturer and dealer, who shall mix Spanish with short cut tobacco, or any tobacco-stalk flour with snuff, or snuff of different sorts the one with the other, shall every day enter in a book or paper, the quantity sold, sent out, or consumed of two pounds or upwards, and the gross weight thereof, and the time when mixed; on pain of forfeiting 50*l*. 29 Geo. III. c. 68.

When any officer shall discover that the manufacturing of tobacco or snuff is carried on in any unentered place, and that any person knowingly assists, or is in any ways concerned in carrying on the same, every such person shall forfeit 30*l*. over and above all penalties and forfeitures that the proprietor thereof shall be liable to; and such officer or his assistant, may stop and arrest such person, and convey him before a justice, who, on his confession, or the oath of one witness, may convict such person so discovered, who shall immediately pay the said penalty to such officer or person who brought him; and if not so paid, such justice shall commit him to the house of correction to hard labour for six months from the day of conviction, or until the said penalty be paid. And for a second offence, he shall forfeit 60*l*., which, if not paid in manner aforesaid, he shall be committed in like manner for one year, or until such penalty be paid.

The officers of excise (between five in the morning and eleven in the evening without a constable, and between eleven in the evening and five in the morning with a constable) may enter into any house or place belonging to or made use of by any manufacturer or dealer, and take an account of the stock found therein; and shall give credit (as particularly set forth in the act). And if at any time any excess in stock shall be found, of which no notice has been given to the officer, unless received by permit, the same shall be deemed and taken to be brought in without permit.

Every manufacturer and dealer shall keep sufficient scales and weights for the use of the officers, on the penalty of 100*l*. And if any such person shall, in weighing, use any art or device to prevent such officer from taking a true weight of such tobacco, &c. he shall forfeit 200*l*. together with such scales and weights, which may be seized.

And every such manufacturer and dealer shall with a sufficient number of his servants assist such officer in taking such account of stock, on pain of forfeiting 50*l*.

But

TOBACCO.

But no officer shall weigh any tobacco, tobacco-stalks, or snuff-work, whilst actually in the operation of manufacture; except snuff-work intended to be sent out or received by permit.

And unmanufactured tobacco, tobacco in the state of operation, and manufactured tobacco, shall be kept separate from each other; on the penalty of 5*l.*

The officers shall be permitted to take samples of tobacco or snuff, &c. in the possession of any manufacturer or dealer, paying for the same (if demanded) the value or usual price; on the penalty of 10*l.* upon refusal.

Every manufacturer and dealer shall, in a book or paper, to be furnished by the officers, keep an account of all tobacco, &c. and snuffs which he shall have sold, sent out, or consumed the preceding day, in quantities of 4*lbs.* or upwards, of tobacco, &c. and 2*lbs.* or upwards of snuffs; and also another book or paper in like manner, if under 4*lbs.* of tobacco, &c. or 2*lbs.* of snuffs. But no such person shall have more than one such book or paper of each sort at the same time, which is to be returned to the officer, if in London, or any city or market-town every six weeks, elsewhere every six months, or when the same is filled up or demanded; and shall be verified on oath. And such books and papers shall lie open for the inspection of the officer, and shall be made up at his request; on the penalty of 10*l.* for every offence.

If any officer shall discover any increase in stock not legally accounted for, the same shall be deemed and taken to be made by a commodity, for which no duty has been paid, and privately brought in without permit; and such increase shall be forfeited, and may be seized; and the person, in whose stock such increase shall be found, shall also forfeit 20*l.*

But Scotch snuff, in the custody of a manufacturer or dealer, not having gained more than 5*lbs.* in the 100*lbs.* by the moisture of the air, shall be deemed a fair commodity, and such person shall have credit for the same in his stock, and may remove the same by permit. And such snuff shall be kept separate from all other snuff, and shewn to the officer upon demand; on the penalty of 20*l.*

If any manufacturer shall remove any tobacco or snuff out of his entered house or place, before the same has been weighed, and taken an account of by the officer, or shall hide or conceal the same from the view of such officer; he shall forfeit 50*l.*

And no tobacco (except returns) of 4*lbs.* and upwards, nor snuff of 2*lbs.* and upwards, nor any tobacco-stalks, Spanish returns of tobacco, tobacco-stalks for flour, snuff-work, or tobacco-stalk flour, exceeding 200*lbs.* shall be removed by land or water without a permit, on pain of forfeiting the same, with the casks and package, and also the horses, cattle, boats, barges, and carriages used in conveying the same, which may be seized.

Such officer on request shall grant permits, wherein shall be limited the time for such removal; and if the goods permitted shall not be delivered within the time so limited, the same shall be deemed and taken to be removed without permit.

But no permit shall be granted or be valid for the removal of any snuff-work from one part of the kingdom to another except from the entered premises of a manufacturer of snuff, where the same was laid down to the mill for the purpose of grinding; on forfeiture thereof, together with the horses, cattle, boats, barges, and carriages, which may be seized. 30 Geo. III. c. 40.

And no such permit shall be granted or be valid, unless the request note from such manufacturer or dealer contain

the particulars specified in the act, and such permit to correspond with the request note; and if for removing unmanufactured tobacco (other than samples), except the same be in the original package, and be removed according to the regulations specified in the act: and all tobacco, &c. removed contrary thereto shall be forfeited, together with the casks and package, and the horses, cattle, boats, barges, and carriages used in the removal thereof, which may be seized. 29 Geo. III. c. 68.

Provided always, that permits may be granted for the removal of any unmanufactured tobacco, in any quantity not less than 200*lbs.* in any package whatsoever, from the entered premises of any manufacturer to any mill to be manufactured, and back to such entered premises. 30 Geo. III. c. 40.

And every manufacturer of tobacco or snuff may manufacture their tobacco, tobacco-stalks, snuff-work, and returns of tobacco, at any entered mill, and may remove the same by permit to and from such mill.

Provided, that nothing herein shall extend to prevent any manufacturer from ~~stoving or finishing~~ drying tobacco, or drying snuff-work at any mill, provided the officer be allowed to weigh and take an account thereof. 29 Geo. III. c. 68.

Where any permit shall be granted for the removal of any tobacco or snuff, &c. and the same shall not be removed agreeable thereto, such permit shall be returned before the expiration of the time limited for such removal; on forfeiture of treble the value of such goods. And where such permit shall not be so returned as aforesaid, and on taking stock a decrease does not appear to answer the contents of such permit, a like quantity shall be forfeited, and may be seized.

No manufacturer, unless licensed as a dealer, shall have a permit for, or shall sell or send out, any manufactured tobacco, Spanish, or returns of tobacco, in a less quantity than 4*lbs.*, nor snuff than 2*lbs.*; on the penalty of 20*l.*

No tobacco, &c. or snuff, &c. shall be brought into any house or place of a manufacturer or dealer without a permit, and also notice thereof shall be given to the officer; on pain of forfeiting the same, together with the casks and package, which may be seized, and such manufacturer or dealer shall also forfeit treble the value thereof.

No tobacco or snuff, &c. shall be removed from any place without the limits of the bills of mortality or excise-office in London, to any place within those limits; nor from any place without the limits of the ports herein before enumerated to any place within, or within two miles of those limits; on forfeiture thereof, with the casks and package, and also the vessels, horses, cattle, and carriages employed in removing the same, which may be seized. But the same shall not extend to the legal removal of the several articles specified in the act.

By 30 Geo. III. c. 40. tobacco-stalks stripped from the leaf may be removed, by permit, from any entered premises out of the limits of the bills of mortality, to any place within those limits, subject to the regulations in the aforesaid act, and this act specified.

Any manufacturer or dealer, who hath received into his stock, by permit, any tobacco or snuff, may return the same within forty-eight hours to the person from whom he received it under certain regulations. But if found returned, or returning without permit, or shall not be the same identical tobacco or snuff which had been received, without any alteration; the same shall be forfeited, with the casks and package, which may be seized, and the person who shall return the same shall also forfeit 50*l.* 29 Geo. III. c. 68.

If any tobacco of 4lbs. or upwards, or snuff of 2lbs. or upwards, or any tobacco-stalks, &c. shall be found removing, unless between seven in the morning and five in the evening from 29th Sept. to 25th March, and between five in the morning and seven in the evening from 25th March to 29th Sept. (except by a common carrier or vessel which usually goes out of these hours,) the same shall be forfeited, with the casks and package, and the horses, carriages, and vessels made use of in conveying the same, which may be seized, whether the same be accompanied with a permit or not.

If any person whatsoever without a permit, or hawkers with one, shall offer any tobacco, &c. to sale, he shall forfeit the same, together with the package, and also 20*l*. And the person to whom it shall be so offered to sale, may seize the same, and carry it to the next warehouse belonging to the customs or excise, and shall bring the person so offering it to sale before a justice, who shall commit him to prison, that he may be prosecuted for such penalty; and the person so seizing the same shall be entitled to the same rewards as the officers of the customs or excise; and in case such person shall desire it, the commissioners may cause three-pence for every pound of tobacco, &c. so seized to be paid to him, till the same can be disposed of, upon a certificate under the hand and seal of such justice, of such offender being committed to prison; and after sale, the money so advanced shall be replaced out of the produce of such sale.

If any person shall counterfeit or forge any permit, he shall forfeit 500*l*.

If any person shall assault, resist, oppose, molest, obstruct, or hinder any officer in the due execution of this or any other act; or shall rescue any goods which have been seized; or any vessel, horses, cattle, or carriages, which have been forfeited, and for which no particular penalty is provided; he shall forfeit 200*l*.

If any person shall give or offer any bribe, recompence, or reward to any officer to prevent him doing his duty, whether the same be accepted or not, he shall forfeit 500*l*.

No tobacco, snuff, &c. shall be landed, without first making entry thereof with the officers of the customs, on forfeiture thereof, with the casks and package.

If any officer of excise shall have cause to suspect that any tobacco, &c. or snuff, which shall have been imported contrary to this act, or forfeited by this or any other act, is deposited, lodged, hid, or concealed, if within London or Westminster, or the limits of the chief office, upon oath made before two commissioners, elsewhere upon oath made before one justice setting forth the ground of his suspicion, such commissioners or justice may, by warrant, authorize such officer by day or night, but if in the night, in the presence of a constable, to enter into such suspected place, and to seize and carry away all such tobacco, &c. or snuff which shall be there found, together with the casks and package containing the same. And if any person shall obstruct or hinder any such officer so authorized, or person assisting him in the execution of such warrant, he shall forfeit 100*l*.

Tobacco and snuff, taken as prize, are subjected to the regulations of this act, by 43 Geo. III. c. 134.

No manufacturer or dealer in tobacco or snuff, or person anywise interested or concerned therein, shall act as a magistrate in the execution of any act relating to tobacco or snuff; and all acts done by such person shall be utterly null and void.

If any tobacco-stalks or stems stript from the leaf shall be imported, the same shall be forfeited and burned, and

the officer seizing the same shall be allowed one penny a pound; and every person, who shall be assisting or otherwise concerned in unshipping the same, or to whose hands they shall knowingly come after unshipping, shall forfeit treble value, together with the vessels, bags, casks, or other things, wherein the same are contained, and the horses, cattle, carts, and other carriages, made use of in removing the same; half to the king, and half to such officer of the customs, who shall seize, inform, or sue for the same. 12 Geo. c. 28. 5 Geo. III. c. 43. 8 Geo. c. 18.

All seizures of vessels or boats of 15 tons or under, and of horses or other cattle and carriages, by virtue of any act relating to the customs, may be prosecuted, heard, and determined, before two justices residing near where the seizure was made. 8 Geo. III. c. 18. 5 Geo. III. c. 43. 29 Geo. III. c. 68.

And all penalties and forfeitures in the excise may be sued for, levied, and mitigated as by the laws of excise, or in the courts at Westminster, half to the king, and half to him who shall sue (unless otherwise particularly directed). 29 Geo. III. c. 68. 30 Geo. III. c. 40. 43 Geo. III. c. 69.

Tobacco-stalks or stems, stripped from the leaf, that are imported, shall be forfeited and burnt, and the officer seizing the same shall be allowed 1*d*. a pound; and persons assisting in unshipping them, &c. shall forfeit treble value, with the vessels, horses, &c. which may be prosecuted and determined before two justices near the place where the seizure was made. (12 Geo. c. 28. 5 Geo. III. c. 43. 8 Geo. c. 18.) By 24 Geo. II. c. 41. and 26 Geo. II. c. 13. no tobacco or stalks exceeding 24lbs. weight, nor any snuff exceeding 10lbs. shall be conveyed by land, without proper certificates, under penalty of forfeiture, together with horses and carriages, and commitment of the carrier to the county-gaol for one month by one justice. The seizure of horses and carriages may be determined by two justices near the place where the seizure was made.

TOBACCO, English, Nicotiana minor, or Nicotiana rustica of Linnæus, is a species of tobacco, which was originally a native of America, but now propagates itself plentifully in England and other parts of Europe. The flowers are of an herbaceous yellow colour, appearing in July, and are succeeded by roundish capsules filled with small seeds, which ripen in autumn. The leaves are said by some to be of the same quality with those of henbane; but by others, to be similar to the preceding, but weaker. They have been sometimes substituted in our markets, instead of the true tobacco; but are easily distinguished by their smallness and oval shape, and by being furnished with pedicles. Lewis.

TOBACCO, Kanaster. See KANASTER.

TOBACCO-Water, among *Sheep-Farmers*, a liquor prepared by infusing or boiling tobacco in water. A very useful mode of preparing it is, by boiling one pound of tobacco in two gallons of strong salt brine, adding, after the liquid has become cool, about three ounces of the oil of turpentine. It is sometimes, too, the practice to dissolve fifteen or twenty grains, or more, of sublimate or muriated quicksilver in the turpentine, before it is added to the liquor or mixture. A small proportion of corrosive sublimate, dissolved in spirits of wine, is also a safe and neat mode of incorporating it with the tobacco-water or liquid.

Tobacco-water, or liquor, is likewise occasionally mixed with other substances; as two pints of it have sometimes three ounces of sulphur mixed in them, being put on a fire until they boil together. The liquor is used in a acid state,

The South Down sheep-farmers have a decoction of tobacco, wildvine-root, and sulphur, which is boiled in brine for a quarter of an hour, and then strained off for use.

Tobacco-water, or liquor, is kept ready prepared for the use of farmers in many places where sheep are largely kept, but it is probably the best way for them to provide their own.

This water, or liquor, is a powerfully efficacious remedy in various cases of the scab kind in sheep, and probably in other animals. It is usually applied by shedding or dividing the wool by the fingers and thumbs, and pouring a little of the liquid in along it. It may be used every night, as there may be occasion. Such diseases are readily removed by it in most cases, and especially in long-woolled sheep, in which they often take place.

In gardening, the simple water, or liquor, which is prepared by infusing or boiling tobacco in soft water, without any admixture, or having any such substances as above dissolved in it, is often found beneficial in destroying and removing insects of different kinds on fruit-trees and fruit-shrubs, by having it repeatedly sprinkled over them by means of a watering-pot, or dew-syringe, or in any other way. Many sorts of these trees and shrubs in hot-houses, and other places, are treated in this manner with great effect and advantage in clearing them of such vermin.

TOBACCO Key, in *Geography*, a small island in the bay of Honduras, near the coast of Yucatan. N. lat. $16^{\circ} 45'$. W. long. $88^{\circ} 35'$.

TOBACCO-Pipe. See **TOBACCO PIPE**.

TOBACCO-Pipe Clay. See **CINOLITE**.

TOBACCO-Pipe Fish, in *Ichthyology*, the English name of the *Acus*, or the *SYNGNATHUS Acus* of Linnæus; which see.

TOBACTLI, in *Ornithology*, a name which Nieremberg says is often given to the American bird more commonly called *hoathli*.

TOBAGO, in *Geography*, one of the Caribbee islands, in the West Indies, about 30 miles in length from south-east to north-west, and about nine in breadth. This island was first discovered by Columbus, in the year 1498; but though projects were formed for settling it, particularly by William, earl of Pembroke, who obtained a grant of it in the year 1628, and also of Barbuda and St. Bernard, they proved ineffectual. About the year 1632, some Zealanders, having fitted out a small squadron for trading to those islands, made such a favourable report of this in particular, upon their return home, that the company of merchants to which they belonged undertook to settle it, and gave it the name of *New Walcheren*, from one of the islands in Zealand. The new colony, in a short time, increased to about 200, who, finding themselves pestered by the visits of the Caribbee Indians, began to erect a fort for their preservation. The Indians had recourse to the Spaniards, who readily granted them assistance. They sent a force upon the island which demolished the rising fort, and exterminated the new colony. It was probably from some Dutch merchants who travelled to Courland, that James, duke of that country, conceived the design of settling Tobago. Being a prince of an active disposition, and finding there was room for such a settlement, he sent over a colony of his own subjects, who settled upon what has since been called *Great Courland Bay*, and erected a small regular fort, with a town, in the neighbourhood; and the duke's title was farther confirmed by a grant from Charles II. king of England, but disputed by the Dutch. Upon the extinction of the Kettler family, dukes of Courland, in the person of Ferdinand, son of duke James, the sief of the

island of Tobago reverted to the crown of England in 1737. By the treaty of Aix-la-Chapelle in 1748, St. Vincent, Dominica, St. Lucia, and Tobago, were declared neutral, and those who remained of the ancient proprietors were left in unmolested possession. By the 9th article of the peace of Paris, signed on the 10th of February, 1763, the three islands of Dominica, St. Vincent, and Tobago, were assigned to Great Britain, and St. Lucia to France; the Charaibes not being mentioned in the whole transactions, as if no such people existed. The climate of Tobago is far more temperate than could be expected in an island that is but 11 degrees 16 minutes north from the equator; for the heat is allayed by the sea-breezes. Tobago has another favourable circumstance to recommend it, by its lying out of the track of those hurricanes that prove so fatal to the other West India islands. The surface of the island is unequal and agreeably diversified; but no part of it is rugged or impassable, though its north-west extremity is mountainous. Its soil is of different kinds, but in general the mould is rich and black, and proper for producing, in the greatest plenty, whatever is raised in other parts of the West Indies. The abundance of springs upon the island contributes to its healthfulness, and its bays and creeks are so disposed as to be very commodious for all kinds of shipping. Its situation, however, requires fortifications to render the island secure against the visits of savages and enemies. Besides its producing the different kinds of wood that are to be found in the other West India islands, the Dutch affirm, that both the true nutmeg-tree and the cinnamon-tree, with that which produces the real gum copal, grows upon the island, but this assertion wants confirmation. Mr. Blome, who, in 1687, wrote "The present State of our American Islands," says that the soil of Tobago produces Indian corn, Guinea corn, pease, beans, French beans, figs, pine-apples, pomegranates, oranges, lemons, limes, plantains, bananas, grapes, guavas, tamarinds, prickly pears, papaws, and a variety of other fruits, which are not to be found in Europe. The cocoa-tree grows here to such perfection, that the Indians call it God's tree, as producing both meat, drink, and clothing. Musk-melons, water-melons, gourds, cucumbers, and pompions, are raised to perfection: neither is there any want of potatoes, yams, carrots, turnips, parsnips, onions, and manioc. Wild hogs abounded so much in Tobago, that the people killed at least twenty thousand of them every year without their being sensibly diminished. Here are likewise found peccaros, resembling swine, armadilloes, guanoes, Indian rabbits, and badgers. Horses, cows, asses, sheep, deer, goats, and rabbits, were probably introduced by the Dutch, and have multiplied exceedingly. The sea is stored with excellent fish, particularly turtle of every kind; and mullets of a most delicious taste, with other kinds unknown in England. In short, the commodities which the country doth, or may produce, are cocoa-nut, sugar, tobacco, indigo, ginger, sarsaparilla, sempervivum, bees'-wax, veneloes, natural balsam, balm, silk-grass, green tar, soap-earth, with many curious shells, stones, marcasites, and minerals. In 1781, the island was surrendered to the French on favourable terms. In 1793, it was again taken by the French, and soon after retaken by the British. N. lat. $11^{\circ} 16'$. W. long. $60^{\circ} 30'$.

TOBAGO, Little, a small island near the east coast of Tobago, about two miles long, and one broad.

TOBAK, a town of European Turkey, in Bessarabia, on lake Jalpug. In 1789, the Russians were defeated by the Turks, near this town; 34 miles N.N.W. of Ismail.

TOBAN, a town of the island of Cuba; 16 miles N.E. of Trinidad.

TOBAR,

TOBAR, a town of Spain, in Old Castile; 18 miles from Burgos.

TOBATA, in *Ancient Geography*, a town of Asia, in the interior of Paphlagonia.

TOBATI, in *Geography*, a town of Paraguay; 50 miles N.E. of Assumption.

TOBED NIGARLEDEGH, a river of New Brunswick, which runs into the St. John, N. lat. $46^{\circ} 50'$. W. long. $67^{\circ} 36'$.

TOBIANUS, in *Ichthyology*, a name given by Schonveldt and others to the ammodytes, or sand-eel.

TOBIRA, or TOBERA, in *Botany*, a Japanese shrub, figured and described by Kämpfer; see *PITTIOSPORUM*, n. 2. See also *EUONYMUS*, where its ill-agreement with the latter genus is noticed.

TOBIS, in *Ichthyology*, a name given by the Swedes to the ammodytes, or sand-eel.

TOBITSCHAU, or TOWACZOW, in *Geography*, a town of Moravia, in the circle of Olmutz; 10 miles S. of Olmutz. N. lat. $49^{\circ} 23'$. E. long. $17^{\circ} 14'$.

TORIUS, in *Ancient Geography*, a river of the isle of Albion, the mouth of which is placed by Ptolemy on the western coast, between the promontory Oëtapitorem and that of Ratofathybius.

TOBLER BACH, in *Geography*, a river of Wurtemberg, which runs into the Glatt, 2 miles N.W. of Sultz.

TOBLPAD, a town of the duchy of Stiria; 8 miles S.W. of Gratz.

TOBOL, a river of Russia, which rises in N. lat. $52^{\circ} 30'$, and long. 81° , in the country of the Kirghizti, in the chain of mountains that parts it from the government of Upha. It pours itself into the Irtysh or Irtyfch at Tobolsk, after running a course of about 500 versts, in which it receives the following rivers; viz. the Ui, the Iset, the Tura, and the Tavda, all which fall into it on the left. Of these, the Tura is the largest; it rises near Verkhoturina, in the Ural mountains, and glides into the Tobol, in lat. $57^{\circ} 30'$, after having taken up the rivers Salda, Tagil, Pyshma, Nitza, &c. into which last-mentioned, the Neiva, the Ætsh, and the Irbit flow. By this accession of waters, the Tura becomes a considerable river, not much inferior to the Tobol itself. The Iset is likewise a river of some consequence, rising out of a lake two versts from Ekatarineburg; and after having taken up several rivers, as the Sifert, the Siuava, the Tsetsha, and the Mizes, falls into the Tobol, in N. lat. 57° . The Tobol has mostly low shores; and in the spring season frequently shade its waters far around.

TOBOLOVO, an ostrog of Russia, in the government of Tobolsk, on the Enisei. N. lat. $69^{\circ} 40'$. E. long. $86^{\circ} 42'$.

TOBOLSK, a city of Russia, and capital of a government, at the confluence of the Irtyfch and Tobol. It is the see of an archbishop, and was heretofore the capital of all Siberia. This city is divided into the Upper and Lower Towns. The Upper Town stands very high, on the east side of the Irtyfch; and the Lower Town lies on a plain, between the hill on which the former is built, and the river. Both towns taken together are of a very large circumference; but the houses being mostly built with wood, it was nearly consumed by fire about the year 1786, and afterwards rebuilt chiefly of stone. It contains about 15,000 inhabitants. In the Upper Town, which is properly called the city, stands the fort, which was built with stone, by governor Gagarin. In the fort are the governor's court, as it is called, the governor's house, the archbishop's palace, the exchange, and two of the principal churches, which are

all stone buildings. The Upper Town, which stands on the east side of the fort, and is inclosed within an earthen rampart, affords nothing remarkable, but a market for provisions and all kinds of small ware, three wooden churches, and a convent. The Lower Town contains a market-place for all kinds of provisions, on which several shops are built. The Upper Town is out of the reach of inundations from the river, by its high situation, which, however, is attended with this inconveniency, that the inhabitants are under a necessity of going down the hill for water. Besides, large masses of earth fall from the side of a hill, on which the town stands, towards the river, almost every year, which obliges the inhabitants to pull down and rebuild the houses that stand near the declivity. The Lower Town, indeed, has water at hand, but is exposed to inundations when the river overflows its banks; but such floods do not happen every year. The town is very populous, and almost the fourth part of its inhabitants is composed of Tartars, who are partly descended from those that were settled there before the conquest of Siberia, and partly from the Bucharians. These Tartars, in general, behave very quietly, and carry on some commerce; but practise no mechanic trades. They are very sober, and averse from intemperance, and all kinds of riotous living. The rest of the inhabitants are Russians, whose ancestors were banished hither for their crimes, or such as are exiles themselves. As every thing is sold here so exceeding cheap, that a common man may live very well at Tobolsk at ten rubles a year; indolence and sloth prevail to such a degree, that it is a hard matter to get the least utensil, &c. made, though the town abounds with artificers, who want neither tools nor materials to carry on their respective trades. The commerce is in a flourishing condition in this city: and the traffic which the Bucharian and Kalmuck merchants carry on in Indian goods, with which they supply all Siberia, and part of Russia, is very considerable. All the Chinese caravans are obliged to pass through this town; and all the furs furnished by Siberia are brought into a warehouse in this city, and from hence are forwarded to the Siberian chancery at Moscow. Several of the Swedish officers, who were taken prisoners at the battle of Pultawa, and sent to Tobolsk, set up schools here, in the year 1713, for teaching the children of Swedes, Russians, Cossacks, Tartars, &c. the German, Latin, and French languages, with geography, geometry, and drawing. Many of them also took in boarders. These schools acquired great reputation; so that children were sent hither for education, from a considerable distance, and the exemplary behaviour of these military pedagogues was attended with uncommon success. However, when the peace of Nyfstadt was concluded, the Swedish officers returned into their own country, and then these beneficial seminaries of learning dropped of course. Some time after a German school was founded here, under the auspices of the empress; 1000 miles E. of Moscow. N. lat. 57° . E. long. $68^{\circ} 14'$.

TOBOLSKIAN TARTARS, derive their appellation from the river Tobol, on which they dwell; and they are the descendants of the inhabitants of Isker or Sibir, their ancient capital, which being reduced to a heap of ruins after Yormak's conquest, they abandoned; and instead of it the Russians afterwards built Tobolsk. These are distinct from the Tartar inhabitants of Tobolsk, who are a barbarian colony. Their number amounts to upwards of 4000 males.

TOBOLSKOI, a government of Russia, extending from N. lat. 55° to 78° . E. long. 59° to 108° , including a considerable part of Siberia. Tobolsk is the capital.

TOBORON,

TOBORON, a town of Thibet; 53 miles N. of Tourfan Hotun.

TOBOSO, EL, a town of Spain, in New Castile; 37 miles S. of Huete.

TOBRONA, a town of the island of Cuba; 148 miles S.W. of Havannah.

TOBRUS, in *Ancient Geography*, a town of Africa Propria, in the number of those situated between the river Bagradus and the town of Thabraca. Ptolemy.

TOBULLA, in *Geography*, a town of Africa, on the E. coast of Tunis; 8 miles N.W. of Medea.

TOBY, a town of Sweden, in East Bothnia, near the Gulf; 20 miles N. of Christianfand.

Toby's Creek, a river of Pennsylvania, which runs into the Allegany, N. lat. $41^{\circ} 8'$. W. long. $79^{\circ} 40'$.

TOCA, a central town of New Granada, E. of Bogota, the capital.

TOCAIGH, a bay on the W. coast of the island of Whyhee: the depth of water was 25 fathoms; the bottom a stiff clay, and good holding ground, incommoded by a patch of rocky bottom, which was found to shoal suddenly, and the depth to decrease to 7. and 2 fathoms, about the fourth of a mile to the fourth-weltward of the anchoring-place; and consequently to be a very great inconvenience to the roadstead, which at best, in the opinion of captain Vancouver, is but a very indifferent one, being entirely exposed to the north-west winds, and the western oceanic swell, which beats with great violence in the reefs that encompass the shores. These reefs stretch out a mile or upwards, leaving between them and the land a narrow channel, that affords comfortable and commodious landing for small boats and canoes; but the landing is at too great a distance from the place of anchorage to allow of prosecuting any debarkation from the ship. N. lat. $20^{\circ} 3'$. E. long. $204^{\circ} 4'$.

TOCAIMA, a central town of New Granada, in the immediate proximity of Bogota, the capital, and W. of it: founded in 1544, at some distance from the river Poti, called Bogota, not far from its confluence with the river Magdalena. Its situation is bad, exposed to great heats, and numerous venomous creatures, and even destitute of water. But the district is very fertile in cacao, tobacco, sugar, maize, yucas, plantains, potatoes, &c. and the fish are abundant in the rivers of Bogota and Fufagafuga, though there be many alligators. The inhabitants, about 700, are mostly poor. Here are mines of excellent copper, though not worked.

TOCANTIN'S RIVER, a river of South America, formed by the union of a number of small rivers in Brasil, which rise about the 18th or 19th degrees of south latitude, and between the 50th and 51st degrees of west longitude. Its course is due north to the 2d degree of south latitude, when it joins the Guanapu, about 120 miles from the sea, and takes the name of Para, from a city so called.

TOCAT, or **TOKAT**, a city of Asiatic Turkey, in the pachalic of Sivas, anciently a city of Pontus, called *Berisa*. It is situated on the river Tofanli, in the corner of a valley, and almost surrounded with mountains, which afford quarries of marble, and well supplied with water from innumerable springs. On the top of a lofty rocky mountain, on the W. side of the town, are the remains of an old castle. The streets are well paved, but frequently built on uneven ground. The houses are tiled, and mostly built with wood. It is the residence of a *cadi*, a *waiwode*, and an *aga*, commanding a thousand janizaries, and some *spahis*. The inhabitants are computed to be 60,000, consisting of 20,000 Turkish families, 4000 Armenians, and about 400 families

of Greeks. The Armenians have seven churches, the Greeks only one. The Armenians make an excellent wine, resembling claret in flavour, but stronger. Fruits are abundant in this town, and the grape-vines are excellent. It is the see of a metropolitan, dependant on the archbishop of Nicfara, or Neocæsarea, an ancient city, almost ruined, about two days' journey from Tocat. Here are some manufactures of silk and yellow Turkey leather; but the chief trade is in copper vessels, kettles, candlesticks, &c. which are sent to Constantinople, Egypt, &c. Tocat may be considered as the centre of trade of Asia Minor. The copper is obtained from the mines of Gumiscana, at the distance of three days' journey from Trebifond, and from those of Caftan Boal, yet richer, and situated ten days' journey from Tokat, on the W., towards Angora. The caravans from Diarbek arrive in eighteen days, from Sinob in six, from Burfa in twenty, from Smyrna in twenty-seven, and proportionally less on horseback, or on mules; 40 miles N.W. of Sivas. N. lat. $39^{\circ} 35'$. E. long. $36^{\circ} 30'$.

TOCAYO. See **TOCUYO**.

TOCCATA, Ital. from *toccare*, to touch: to prelude, to touch an instrument, to play a short movement extempore, previous to the performance of a regular piece.

TOCCATINA, a short prelude, or trial of an instrument.

TOCCAVIENSIS BOLUS, *Bole of Tokay*, in the *Materia Medica*, a fine medicinal earth, dug about Tokay in Transylvania, and esteemed a powerful alstringent. Kentman calls it the *bolus Pannonica vera*; and Crato, *bolus Hungarica*.

This last author esteemed it superior even to the bole armenic of Galen, and had a great opinion of it in malignant fevers. It is a fine and pure earth, and very heavy, moderately compact in its texture, but not very hard; and in colour of a considerably deep and strong yellow. It is naturally of a smooth surface, and does not stain the fingers in handling. It ferments violently with acid menstrua, and does not become red in burning. Hill. See **BOLE**.

TOCHEN, in *Geography*, a town of Germany, in the principality of Anhalt Zerbst; 5 miles W. of Zerbst.

TOCHU, a town of Africa, in the kingdom of Quoja.

TOCKAY, in *Zoology*, the name of a species of Indian lizard, distinguished from the other kinds, by being spotted all over.

TOCKSDORF, in *Geography*, a town of Prussia, in the province of Bartenland; 6 miles N.W. of Rastenburg.

TOCMIA, in *Ancient Geography*, a town of Arcadia, in the southern part to the N.W. of Megalopolis, and E. of the Alpheus. It stood upon an eminence; but it was in ruins in the time of Pausanias.

TOCMOL, in *Natural History*, a name given by some to the common turtle.

TOCOCA, in *Botany*, a Caribbean name, used by Aublet.—Guian. 437. t. 174. Juss. 330. See **MELASTOMA**.

TOCOLOSIDA, in *Ancient Geography*, a town of Africa, in Mauritania Tingitana. Ptolemy. The Itinerary marks it 48 miles from Tingis, and three miles from Volubilis.

TOCORARY, or **TUKORARI**, in *Geography*, a town of Africa, in the country of Ante; 10 miles E. of Infuma.

TOCORT. See **TUGURT**.

TOCOSANNA, in *Ancient Geography*, a river of India, on the other side of the Ganges. Ptolemy places its mouth in the Ganges.

TOCOYENA, in *Botany*, an unexplained name.—Aubl. Guian. 131. t. 50. Juss. Illustr. t. 163.

See **GARDENIA**, of which this is probably a species. The author calls his only species *T. longiflora*, and his description contains the following particulars.

The *stem* is three feet high, erect, simple, leafy, scarcely shrubby. *Leaves* opposite, erect, pliant, fifteen inches long, lanceolate, entire, smooth, tapering at each end, on smooth *footstalks*, about an inch and half in length, attached to a pair of triangular, acute, combined, intrafoliateous *stipulas*. *Flowers* about fourteen in a terminal head, in opposite sessile pairs, each flower accompanied by two small scaly *bractæas*. *Calyx* superior, bell-shaped, in five small segments, measuring with the *germen* not more than four lines. *Corolla* with a yellowish cylindrical tube, as thick as a goose-quill, and nine or ten inches long, dilated at the throat, and terminating in a white bell-shaped limb, with five ovate, equal, spreading segments. *Anthers* nearly sessile, between the segments of the corolla, oblong, incumbent. *Germen* oval, inferior. *Style* capillary, the length of the tube, tumid and hairy for an inch below the top. *Stigma* of two large, compressed, oval lips, included within the throat of the corolla. *Berry* oval, an inch long, crowned with the calyx, of two cells, with numerous roundish *seeds*, imbedded in viscid pulp. The *flowers* have a very sweet smell. Aublet met with several plants of this species in the wood of Aroura in Guiana, flowering in August.—All the leaves were perforated or gnawed by insects. His dried specimen of the flower is as black as ink. If *mannia* of Thunberg and Salisbury be distinct from *Gardenia*, the present plant should seem to belong to the former.

TOCRUM, in *Geography*, a town of Bengal; 8 miles S. of Koonda.

TOCRUR, a town of Africa, and capital of a kingdom, in Nigritia, on the north side of the Niger, W. of Cashna; 270 miles E.N.E. of Tombuctoo. N. lat. 16° 32'. E. long. 6° 5'.

TOCSON HORUN, a town of Thibet; 20 miles W.S.W. of Tourfan. N. lat. 43° 26'. E. long. 89° 14'.

TOCUYO, a city of South America, in the government of Venezuela, situated in a valley formed by two mountains. Its division and construction are very regular: the streets are on a line, and sufficiently wide. It has a well-built parish church, on which depends a chapel of ease. The Franciscans have one monastery, and the Dominicans another. It is governed by a common-council. The climate is rather cold than hot; and though the sky is often overcast, the air is wholesome. The inhabitants are graziers, agriculturists, artificers, and traders. The wheat of its vicinity is reckoned the best in the province, and furnishes sufficient for the consumption of many towns of the interior. They export from 8000 to 10,000 quintals of flour. From the wool of their sheep they fabricate coverlids, and other cloths, which they carry as far as Maracaibo and Carthagena. They have also tanneries and taweries, and, like the inhabitants of Carora, work up as many as they can of the raw materials, and sell the rest. Another article of commerce, very lucrative to the citizens of Tucuyo, is salt, which they bring from the salt-ponds of Coro. In this city are reckoned 10,200 persons, who are reproached with the crime of suicide. Tucuyo is 90 leagues distant S.W. of Caraccas, and 20 leagues N. of Truxillo. N. lat. 9° 35'. Long. W. of Paris 72° 40'.—Also, a river of Venezuela, which discharges itself into the sea, 25 leagues E. of the Gaigues, which runs 16 leagues W. of Coro. The source of Tucuyo is about 15 leagues S. of Carora, upwards of 60 leagues from the sea. It is navigable as far as Banagua, a village situated on its banks, at the distance of 40 leagues from its mouth. Its vicinity

furnishes abundance of timber of the largest size, and fit for every kind of building. Depons, vol. i. and ii.

TOD of Wool is mentioned in the statute 12 Car. II. c. 32. as a weight containing twenty-eight pounds, or two stone. See **WEIGHT**.

Some will have the word derived from the French, *toilet*, a wrapper, within which, by usage, two stone of wool are folded.

A last of wool contains 12 sacks, a sack 2 weighs, 13 tods, 26 stone, 52 cloves, or 364 pounds.

TOD-Head, in *Geography*, a cape on the east coast of Scotland, in the county of Kincardine; 5 miles S. of Stonehaven. N. lat. 56° 51'. W. long. 2° 11'.

TODDALIA, in *Botany*, Juss. 371. Poiret in Lam. Dict. v. 7. 693, a barbarous name made out of the Kaka-toddali of Rheede, Hort. Mal. v. 5. 81. t. 41. (See **SCOPOLIA**.)

—Todda, with some addition, is the appellation of other Indian plants, as Todda-pana of *Cycas circinalis*, and Toddavaddi of *Oxalis sensitiva*. We humbly hope that the worthy M. Poiret, who is so highly displeas'd at our wishing to retain a *Scopolia*, will approve of our having so much labour'd to establish a **POIRETIA**. See that article.

FODDA-PANA, the name by which many authors call the *palma farinifera*, or fago-tree.

TODDINGTON, or **TUDDINGTON**, in *Geography*, an ancient market-town in the hundred of Manshead, and county of Bedford, England; is situated five miles N. by W. from Dunstable, and 39 miles N.W. by N. from London. A market was originally held here on Thursdays, by a grant from king Henry III. in 1218; but this was changed to Saturday, by a charter of Edward II. in 1316, which was confirmed by Richard II. in 1385. In 1681, the market was so considerable, that sixteen butchers rented stalls in the market-place. It gradually declined, and of late years has been wholly discontinued. The market-house was pulled down in 1799, and the materials sold. It is probable, that it had been before discontinued, and afterwards revived, as Leland does not include Toddington in the list of the market-towns in Bedfordshire. A fair was granted by the charters of 1218 and 1316: five are now held in the year. The population return of the year 1811, states the parish to contain 259 houses, and 1143 inhabitants. The manor of Toddington was given by William the Conqueror to Ernulfus de Hefdin, ancestor of the earls of Perch. On the death of the last earl, in 1216, it devolved to the earl of Pembroke, and from him to Paulinus Peyvre, steward of the household to Henry III. From the Peyvre family, the manor descended to sir Thomas Cheney, K. G. whose son, Henry, was knighted by queen Elizabeth in 1563, she being then on a visit to him at Toddington. In 1572, she created him lord Cheney. Lord Cheney built a noble mansion at Toddington, of which nothing now remains but the kitchen, which is remarkably spacious. Toddington church is a handsome structure; the frieze, on the outside, is decorated with grotesque figures of animals. The south transept contains some ancient monuments of the Peyvres, and also those of the Cheneys. The north transept was the burial-place of the Wentworths, and contains two monuments to lady Maria, and lady Henrietta Wentworth, on each of which 2000*l.* were expended. Both transepts are in a shameful state of dilapidation. In the year 1443, an hospital was founded at Toddington, by sir John Broughton, for three poor men, and a master or chaplain, who was to pray for the souls of the Peyvre family. There are now no traces of the hospital: the stones were used in building the market-house. Lysons's Magna Britannia, vol. i. Bedfordshire, 1806.

TODDIPOODY, a town of Hindoostan, in the circar of Rajamundry; 18 miles E.S.E. of Rajamundry.

TODDY, or **TODDI**, is a juice drawn from various kinds of palms, by cutting off the branch intended by nature to produce fruit, and receiving from the wounded branch the sap which was designed for the nourishment of the future crop. But as toddy, although sweetish when first drawn, is in a state of fermentation in the course of 24 hours, acquiring an intoxicating quality, and thus becomes sour and harsh, it could not have been the palm-wine of the ancients; which must have kept for some time, as it was carried on the rivers during voyages of many days, and even appears to have been stored up. Toddy is used with molasses, rice, and other ingredients, in the distillation of *Arrack*; which see. The toddy of the date-tree is said to be of an inferior quality to that from some other kinds of palms. The palm-wine was made in Babylonia, where palms abounded, of the fruit of the palm-tree. This was sweet to the taste, but apt to give the head-ache. The palm, as Herodotus informs us (Clio, c. 193.) produced to the inhabitants of Babylonia, bread, wine, and honey. The wine must have been very plentiful, for he says that the boats which descended the Tigris from Armenia, some of which were very large, were loaded with palm-wine as the principal article of their commerce. We derive similar information from Xenophon, who speaks of the floats that passed the Euphrates at Carmanda, and the Tigris at Cænæ. We learn, from the travels of M. Burckhardt in Nuba (Nubia) in 1813, that the practice of making wine as an article of commerce is discontinued in Mesopotamia and Babylonia, where the date-trees abounded, and where the profusion of fruit rendered wine so plentiful, because in modern times the want of a proper distribution of water for irrigation, has left only a small proportion of date-trees; and hence it is probable, that none of the fruit can be spared from the necessary demand for food. Kämpfer is silent on the subject of palm-wine; and this circumstance satisfactorily proves the discontinuance of the practice of making it in those countries. M. Burckhardt tells us, that in all the larger villages of Nubia, the use of palm-wine is very common; and at Derr, the reputed capital of the country, a great quantity of spirit is consumed. The wine, he says, does not taste amiss; but it is too rich and too thick to be drunk with pleasure. When the date-fruit has acquired its full maturity, it is thrown into large earthen boilers, and left to boil without interruption for two or three days. It is then strained, and the clear juice put into earthen jars, well closed and buried in the ground, where it ferments. It is left ten or twelve days under ground; at the expiration of which time it is fit to drink. It keeps for twelve months, and then turns sour. The aqua-vitæ made from dates is of a very good quality, and keeps well for years. People of the upper classes at Derr are every evening intoxicated either with date-wine or spirits, of which great quantities are consumed. They are sold openly. From Siout, southward, through Upper Egypt, date-spirits are made and publicly sold; the pacha receiving a tax upon it from the inn-keepers: they also make a kind of jelly or honey from the dates, which serves for a sweet-meat.

TODDY-Tree. See **MAMMEE-Tree**.

TODEA, in *Botany*, a supposed genus of ferns, dedicated by Willdenow to the memory of the Rev. Henry Julius Tode, a clergyman of Mecklenburg, who died in 1797, aged 64. He is distinguished among cryptogamic botanists, as the author of an accurate and practical work, in quarto, with numerous plates, entitled *Fungi Mecklen-*

burgenses Selecti, published at Lunenburg, in 1790, to which the reader will find frequent references in our several articles relating to the order of *Fungi*. This genus, however, is sunk in **OSMUNDA**; see that article, n. 3.

TODENDORP, in *Geography*, a town of the duchy of Holstein; 6 miles N.E. of Hamburg.

TODI, MARIA FRANCISCA, in *Biography*, born in Portugal in 1748, arrived in England in 1777, with Jermoli, as first woman in the comic opera. She must have improved extremely after she left this country, where she remained only one season, and was little noticed; her voice being feeble, and seldom perfectly in tune. But she afterwards became the most captivating singer for taste and expression in cantabile airs, in France and Germany (according to report), that ever appeared in Europe. She was taught by Perez.

TODI, in *Geography*, a town of the Popedom, in the duchy of Spoleto, near the Tiber, the see of a bishop, immediately under the pope. It contains several churches and convents; 18 miles W. of Spoleto. N. lat. 42° 47'. E. long. 12° 18'.

TODIALOOR, a town of Hindoostan, in the country of Coimbatore; 5 miles N. of Coimbatore.

TODIVESTI, a town of Moldavia; 6 miles N.E. of Suzava.

TODOROVA, a town of Croatia; 18 miles W.N.W. of Novi.

TODOS SANTOS. See *ALL-Saints*.

TODS, a town of the state of Virginia; 9 miles E.N.E. of Hanover.

TODTENVOGEL, in *Ornithology*, a name by which Gesner and some other authors have called that species of cananthe, known in England by the name of the *stone-chatter*, *stone-smith*, or *moor-titling*.

TODTIBERG, in *Geography*, a mountain of Switzerland, and reckoned one of the highest in the country, in the road from Disentis to the Grisons.

TODUCÆ, in *Ancient Geography*, a people of Africa, in Mauritania Cæfariensis, towards the source of the river Ampfaga.

TODUS, TODY, in *Ornithology*, a genus of the order *Picæ*, the characters of which are, that the bill is awl-shaped, somewhat depressed, obtuse, straight, and at its base beset with bristles; the nostrils are ovate and small; the feet are formed for walking; and the outer toe is connected at the base to the middle one.

Species.

VIRIDIS. Green, with a red breast: the green tody. Found in the warmer parts of America, and the neighbouring islands.

CINEREUS. Ash-coloured, with the under part yellow: the *Tie-tie* of Buffon; the grey and yellow fly-catcher of Edwards. Found in open places of Surinam and Guiana.

FUSCUS. Ferruginous, under part olive-coloured, spotted with white; the tail ferruginous, and wings crossed with a blackish bar. Found in South America, less than the green.

CÆRULEUS. Blueish, with white throat; temples, throat, and abdomen orange. Found in America, of the size of the green.

VARIUS. Varied with blue, black and green; the bill, head, throat, neck, feet, nails, and tail black; the margin of the tail, and the coverts of the wings, green. Found in India.

LEUCOCEPHALUS. Black, the head subcristated; throat and upper part of the neck white: white-headed tody of Latham. Found in America.

BRACHYURUS. Black, the vertex, neck, back, and short tail black: the short-tailed tody of Latham. Found in America.

PLUMBEUS. Above lead-coloured hoary, beneath milky; the crown, wing-feathers, and tail black: plumbeous tody of Latham. Found in Surinam.

OBSCURUS. Above brown and black, underneath very fordid white, with pale throat: the dusky tody of Pennant and Latham. Found in Rhode island.

REGIUS. Black and brown; the breast whitish, striated transversely with blackish; the throat and eye-brows white; the abdomen, rump, and tail red; the crest ferruginous at the apex, tipped with black: king tody of Latham. Found in Cayenne.

PARADISEUS. Crested head black; body white; tail wedge-formed; the intermediate tail-feathers very long: pied bird of paradise of Edwards, and paradise fly-catcher of Latham. It has the following varieties; *viz.* the tody with wings and tail pale-red; the tody underneath white, the breast from cærulescent to cinereous; and the Brazilian crested tody. Found in Africa and the island of Madagascar.

FERRUGINEUS. Ferruginous-black, underneath ferruginous; wing-feathers marked with a brown bar; cheeks spotted with black and white: the ferruginous-bellied tody of Latham. Found in Cayenne.

NOVUS, or GULARIS. Brown, underneath white; throat white, and breast spotted with brown, above yellow: white-chinned tody of Latham.

PLATYRHYNCHOS, or ROSTRATUS. Brown-yellowish, beneath yellow, throat whitish; vertex lead-coloured, with a white spot upon it; wings and tail brown; bill very broad: the broad-billed tody of Latham.

MACRORHYNCHOS, or NASUTUS. Black, bill very broad; chin, sides of the cheeks, abdomen, vent and rump red: the great-billed tody of Latham.

RUBECULA. Cinereous, with orange throat and breast, and white abdomen: the red-breasted tody of Latham. Native of New Holland.

XANTHOGASTER, or FLAVIGASTER. Brown-cinereous, six inches long; beneath luteous, with pale bill: the yellow-bellied tody of Latham. Native of New Holland.

CRISTATUS. Crest crimson; body brown, spotted with white. Found in Guinea.

TOEBAN, in *Geography*, a town on the N. coast of the island of Java.

TOELCHUS de Apie, a district of South America, in the country of Patagonia.

TOELCHUS de la Caballo, a district of South America, in the country of Patagonia.

TOE-LING HO-TUN, a town of Chinese Tartary; 375 miles E.N.E. of Peking. N. lat. 42° 22'. E. long. 123° 29'.

TOENDE, in *Commerce*, a corn measure in Denmark, equal to 8 scheffels or skipers, or 32 foertels or fierdingers, and 12 toendes = a last: 100 toendes of Copenhagen, answer to about 49½ English quarters. A last of Spanish salt, or of coals, contains 18 toendes, and the toende = 8 skipers or 176 pots, which contain 5½ Danish cubic feet; but Norway salt is sold by weight, and the toende must weigh 250 lbs. Danish weight, or 275 lbs. avoirdupois. A last of French salt, or of lime, contains 12 toendes, corn measure; a last of oil, butter, and other fat substances, is 12 toendes, beer measure; and a toende of beer must hold 4¼ Danish cubic feet, or 136 pots. By a tonne or toende of hard corn is meant as much land as can be sown with 1 toende of rye, 1 of barley, and 2 of oats. What is called a toende of sautland or arable land is the fourth part

of the above, and contains 563½ Danish square rutes, or 220 English square perches. Thus the toende of hard corn is = 5¼ English acres. A Danish square foot contains about 153 English square inches; or 16 Danish square feet = 17 English square feet nearly.

TOENII, in *Ancient Geography*, a people of Germany, in the vicinity of a lake, which was common to them, the Rhætiens, and Vindelicians. Ptol.

TOENJOKER, in *Geography*, a small island in the East Indian sea. S. lat. 5° 30'. E. long. 132° 32'.

TOES, by anatomists called *digiti pedis*, are the extreme divisions of the feet, answering to the fingers of the hand, and resembling them in figure, and make the third part of the foot. See **EXTREMITIES.**

TOES, Adhesions of the. It is a frequent thing to meet with new-born infants with their fingers or toes cohering or growing together, either by a strict adhesion of the flesh, or else by some loose productions of the skin, as in the feet of ducks and geese; and a disorder of the same kind is also sometimes found in adults, from accidents; as when the fingers or toes have been neglected, after an excoriation of them by burns or wounds. In both these cases the surgeon's assistance is necessary, partly to remove the deformity, and partly to restore the proper use of the fingers.

These adhesions, according to the nature of the disorder, are to be separated by cutting out the intermediate skin, or else barely by dividing them from each other with a pair of scissors. When this is done, to prevent their cohesions again, each finger must be invested separately with a spiral bandage about an inch broad, dipped in lime-water and spirit of wine.

Sometimes the fingers, instead of adhering to each other, grow to the palm of the hand, from wounds or burns; so that they cannot be by any means extended, or drawn back to open the hand. The method of relieving this disorder is first very carefully to separate the fingers from the adhesions of the palm, without injuring their tendons, then dress them with a vulnerary balsam, and scraped lint, and extend them on a ferula or thick paste-board; and let them remain in this extended posture, separately to be dressed till they are perfectly healed; but at every dressing they must be gently moved, to prevent a rigidity or stiffness of the joints. Heister.

TOE, in the *Manege*, is the stay of the hoof upon the fore-part of the foot comprehended between the quarters.

We commonly say the toe before, and the heel behind, in French *pince devant et talon derriere*; implying, that in horses, the toe of the fore-feet is stronger than the toe of the hind-feet: and, on the other hand, that the heels behind are stronger than those before; and accordingly, in shoeing we drive highest in the toes of the fore-feet, and in the heels of the hind-feet.

A horse that does not rest his hind-feet all equally upon the shoe, but raises his heels, and goes upon the toes of his hind-feet, is called in French *rampin*.

TOE-Head, in *Geography*, a cape of the county of Cork, Ireland, not far from the Stags of Castlehaven. N. lat. 51° 27'. W. long. 9° 9'.—Also, a cape of Scotland, on the S.W. coast of the island of Lewis, in that part called Harris; 42 miles S.W. of Stornaway. N. lat. 57° 50'. W. long. 7° 5'.

TOE-Shell, in *Conchology*. See **POLLICIPES.**

TOE-Stick, in *Agriculture*, the stick or bar which confines that part of small carts in its place, that contains the load, but which, on being slipped out, lets that or a part of it be discharged. It has been observed in the Corrected Agricultural Report of the County of Norfolk, that Mr. Overman,

Overman, of Burnham, in that district, has made an improvement in his carts of this kind: instead of the toestick drawing out to let the back or framed part of the cart tilt up, and deliver the load or part of it, this contrivance turns in the centre on a pivot, and the hooks which confine it at the ends, are each in a position the reverse of the other, by means of which it is expeditiously effected.

TOESA, in *Commerce*, a long measure in Spain; the toesa or braza is 2 varas, or 6 feet, that is, $66\frac{2}{3}$ English inches; a paso or pace, is 5 feet; an estadal, 12 feet, or 4 varas; and a cuerda, $8\frac{1}{2}$ varas.

TOESCHI, ALESSANDRO, in *Biography*, the head of a celebrated musical family from Romania, settled at Munich, who in 1756 was appointed concert-master to the elector of Bavaria's ecclesiastical band.

TOESCHI, CHARLES JOSEPH, after being director of the chamber-music of the court of Bavaria, in 1756 was appointed first violin in the famous band of the elector palatine at Manheim. He was seven years concert-master, and engaged in other honourable professional employments about the court of Manheim till 1786. In 1766 he published at Paris six symphonies; violin quartets; and flute concertos. About the same time, six violin duets, and other works at Amsterdam. His style is full of fire, new effects, and in slow movements, grace and elegance. He was a disciple of the great Stamitz, and died at Manheim in 1788, in the 60th year of his age, leaving behind him an excellent private character.

TOESCHI, JOHN, concert-master at Manheim, and an admirable performer on the violin. He was one of the principal ornaments of the famous court-band in 1756.

TOESCHI, SUSANNAH, a singer of great merit in the service of the court at Munich, brought up under Holtzbauer, the maestro di capella to the elector palatine.

TOESOBIUS, in *Ancient Geography*, a river of the isle of Albion, which had its mouth, according to Ptolemy, on the western coast, between the gulf Sercia and the promontory Ganganorum: probably the river Conway.

TOE-YAH-YAH, in *Geography*, a bay of Owhyhee, one of the Sandwich islands, extending along the whole coast from the westernmost point, to the northern extremity of the island, and bounded to the N. by two very conspicuous hills. Towards the bottom of the bay there is foul, corally ground, extending upward of a mile from the shore, without which the soundings are regular, with good anchorage, in twenty fathoms. Cook's Third Voyage, vol. iii.

TOFIELDIA, in *Botany*, was so called by the late Mr. Hudson, after his correspondent Mr. Tofield, who resided in the neighbourhood of Doncaster, and to whom British botanists are indebted for the discovery of *Vicia lithynica*, the original specimens of which are preserved in his herbarium, now belonging to William Younge, M.D. F.L.S. of Sheffield, Yorkshire.—Hudf. Angl. ed. 2. 157. Sm. Fl. Brit. 397. Dryandr. in Ait. Hort. Kew. v. 2. 324. Pursh 246. Kunth Nov. Gen. et Sp. Pl. v. 1. 267. (Anthericum; Linn. Gen. Pl. ed. 1. 106, but not of the subsequent editions. Narthecium; Ger. Gallopr. 142. Juss. 47. Michaux Boreal.-Amer. v. 1. 209. Lamarck Illustr. t. 268.)—Class and order, *Hexandria Trigynia*. Nat. Ord. *Tripetaloides*, Linn. *Junci*, Juss.

Gen. Ch. *Cal.* Perianth inferior, of one leaf, membranous, three-cleft, small, permanent. *Cor.* Petals six, oblong, concave, equal, spreading, permanent, many times longer than the calyx. *Stam.* Filaments six, opposite to the petals, awl-shaped, simple, smooth, about the length of the corolla; anthers incumbent, roundish-heart-shaped. *Pist.* Germens three, superior, converging, pointed, termi-

nating in as many short, distant, vertical styles; stigmas capitate. *Peric.* Capsules three, connected at the base, gibbous, keeled, membranous, of one cell and two valves, bursting chiefly at the inner edge. *Seeds* numerous, elliptic-oblong, angular, inserted into the inner margin of each valve.

Eff. Ch. Calyx three-cleft. Petals six, equal. Styles vertical, short. Capsules three, superior, combined at the base. Seeds numerous. Anthers roundish.

The small membranous permanent calyx, more or less distantly separated from the other parts of the flower by an elongation of the base of the latter, is the very peculiar character of *Tofieldia*. By this it is distinguished from *HELONIAS*, *NARTHECIUM* and *ANTHERICUM*, with all which it has been confounded; see those articles. *Helonias* moreover has a simple germen and capsule, with very few seeds. *Narthecium* and *Anthericum* have each a simple style; the former hairy filaments, and tunicated seeds; the latter angular seeds.

Five of the six species, now known to compose the genus before us, have been confounded together as one. We shall give their characters, and most essential synonyms. The whole history of the mistakes which have embroiled the synonyms and characters, both generic and specific, of *Tofieldia*, have lately been detailed, more at length than suits our purpose here, in a paper communicated to the Linnæan Society by the writer of the present article.

The species are all perennial and herbaceous, with simple stems, spiked, or generally clustered, flowers, sword-shaped, equitant, mostly radical, leaves, the habit of the whole very nearly according with *Narthecium*. The seeds, in some instances, betray an affinity to that genus, in a little membranous appendage at each extremity, as may be seen in our *T. alpina*.

1. *T. palustris*. Scottish Asphodel, or Marsh *Tofieldia*. Hudf. n. 1. Fl. Brit. n. 1. Ait. n. 1. Engl. Bot. t. 536. (*T. pusilla*; Pursh n. 1. *Anthericum calyculatum*; Linn. Sp. Pl. 447. Fl. Lapp. ed. 2. 106. t. 10. f. 3. Fl. Dan. t. 36. Lightf. Scot. 181. t. 8. f. 2. *Helonias borealis*; Willd. Sp. Pl. v. 2. 274.)—Head of flowers ovate. Stem smooth, thread-shaped, leafless. Petals obovate, obtuse. Germens roundish.—Native of bogs, and the margins of rivulets, on the mountains of Lapland, Scotland, Durham, and North America, flowering about July. A little smooth plant, of a deep green, with a slender solitary stem, from four to six inches high, naked, except an occasional small leaf at the base. The radical leaves are two inches long, erect, forming several tufts. Flowers small, pale green, in a solitary ovate-oblong dense head, scarcely more than half an inch in length, often much less. There are hardly any discernible bractees, the calyx being close to the main stalk, and divided down to the base, into three small, acute, membranous segments. The rest of the flower is elevated on a short stalk within the calyx, which, as the fruit advances, becomes very conspicuous. The capsules are obovate, each about the size of mustard-seed, crowded together into a globular form, minutely pointed, and crowned by the styles.

Michaux and Pursh, mistaking what we shall next describe, for the true Linnæan *Anthericum calyculatum*, justly considered this as a new species. A little examination, of the *Flora Lapponica* in particular, would have prevented this error, though all writers upon European plants have hitherto confounded the two species in question.

2. *T. alpina*. Alpine *Tofieldia*. Sm. MSS. n. 2. (*T. palustris*; Redout. Liliac. t. 256. *Narthecium iridifolium*; Villars Dauph. v. 2. 225. *N. calyculatum*; Allion. Pedem.

TOFIELDIA.

v. 2. 165. Poiret in Lamarck Dict. v. 4. 431, the synonyms confused. Phalangium alpinum palustre, iridis folio; Tourn. Inst. 368. Segu. Veron. v. 2. 61. t. 14, copied in Lamarck's t. 268. Pseudo-asphodelus fecundus; Clus. Hist. v. 1. 198. Asphodelus Lancastræ verus; Ger. Em. 96.)—Cluster cylindrical. Bractæas nearly equal in length to the flower-stalks. Stem smooth, bearing two leaves. Petals obovate. Germens oblong.—Very common in moist grassy pastures, or the margins of rivulets, on the Alps of Austria, Switzerland, Italy, Savoy and Dauphiny, flowering in August. We know not of its having ever been observed in Britain, notwithstanding the name in Gerarde's herbal, which is misapplied to the figure of this plant, and properly belongs to *Narthecium ossifragum*, exhibited in the preceding page of the same book. Linnæus knew the present species by its synonyms only, cited, with marks of well-founded doubt, in his *Fl. Lapp.* He was led by Dillenius to esteem it a mere variety of the foregoing, an opinion generally adopted ever since, but certainly for want of due enquiry. The *alpina* is not only twice the size of *palustris*, with a thicker more woody root, but the stem always bears two distant leaves. The flowers form a cluster, not a head or spike, from one to two inches long, often interrupted, with a concave bractea at the base of each stalk, about its own length. Calyx close to the rest of the flower, rather slightly three-cleft. Petals more yellowish. Capsules oblong, combined almost all the way up, thrice as large as in *palustris*. As the fruit advances, the partial stalks become still more evident than in the flower.

3. *T. stenopetala*. Narrow-petalled Tofieldia. Sm. MSS.—Cluster cylindrical. Bractæas overtopping the calyx. Stem smooth, bearing two leaves. Petals lanceolate, acute.—Native of North America, where it was gathered by Kalm, whose specimens were referred by Linnæus to his *Anthericum calyculatum*. They more agree with our *T. alpina*, in size and habit, having two or three leaves on the stem. The cluster is dense and obtuse, an inch and a half long. Bractæas very different from that species, being lanceolate, and always as long as the partial stalk and calyx taken together; sometimes much longer. Calyx broad and shallow, unequally notched. Petals greenish-white, lanceolate, narrow and acute, not obovate. Anthers pointed. Germens tapering into styles twice the length of the foregoing. No doubt can exist of this being a most distinct species. We find no indications of it in the works of Michaux or Pursh, nor is its precise place of growth known.

4. *T. cernua*. Drooping-flowered Tofieldia. Sm. MSS. (*Anthericum* n. 39; Gmel. Sibir. v. 1. 73. t. 18. f. 2.)—Cluster cylindrical. Flowers drooping. Bractæas very short. Flower-stalks smooth, the length of the corolla. Stem leafless.—Found by Gmelin in mountainous woods in Siberia, flowering late in July. This is a species so evidently distinct from all the foregoing, that we cannot account for their having been confounded; except by supposing that Linnæus, not having specimens of each in fruit as well as in flower, too hastily considered the various appearances before him, as caused by different stages of growth. The drooping flowers, and quite pendulous fruit, of the present plant are remarkable at first sight; and the former are expressed in Gmelin's figure. These characters are too decided, in both our specimens, to be attributed to any accident in drying. The whole plant indeed is larger than any of the former three, with more creeping roots. Stem a foot high, or more, quite leafless, except at the very bottom, glaucous in the upper part. Leaves near three inches long, narrow, with a small oblique point, such as may be seen in some of the leaves of most of the species,

except *stenopetala*, whose foliage is peculiar for its long, straight, taper points. Cluster erect, smooth, two inches long while in flower, near four when in seed, rather lax, many-flowered, scarcely interrupted. Flower-stalks spreading, slender, scattered, about an eighth of an inch long, and still longer when the fruit is full-grown, having a little ovate bractea at the base of each, about a quarter the length of the stalk. Flowers white, about twice the size of *Convallaria bifolia*. Calyx with three shallow lobes. Petals obovate, obtuse, slightly pointed, concave, the length of the flower-stalks, and keeping pace with them in their subsequent elongation. Stamens shorter than the corolla, with yellow, heart-shaped, pointless anthers. Germens ovato-lanceolate, with longish styles. Capsules shorter than the permanent corolla, obovate, membranous, but brittle, combined nearly all the way up, so as to form a turbinate three-lobed fruit, crowned with the three spreading styles and capitate stigmas. Seeds minute, prismatic.—Gmelin's supposed variety, taken from Steller, having a leafy stem, is probably another species. *T. cernua* is a very pretty plant, and we may hope that, in some of the frequent importations from Siberia, it may be introduced into the gardens of England.

5. *T. pubens*. Downy American Tofieldia. Dryandr. in Ait. Hort. Kew. n. 2. (*T. pubescens*; Pursh n. 2. *Narthecium pubens*; Michaux Bor.-Amer. v. 1. 209. *Anthericum filamentis lævibus*, perianthio trifido; Linn. Hort. Cliff. 140. Gron. Virg. ed. 1. 39. *Asphodelus minor albus*; Pluk. Mant. 29. Phyt. t. 342. f. 3.)—Cluster cylindrical, interrupted. Flower-stalks aggregate, rough, the length of the corolla.—Found in the moist meadows, and mossy boggy woods, of Virginia and Carolina, flowering in July, according to Clayton and Pursh. This is most like the last in stature and habit, but the roughness of the flower-stalks and their main stalk, essentially distinguishes it. The former grow three or four together, as if rather whorled than scattered. The flowers are white, with yellow anthers, and appear to be always erect.

6. *T. glutinosa*. Viscid Yellow Tofieldia. Pursh n. 3. (*Narthecium glutinosum*; Michaux Bor.-Amer. v. 1. 210.)—Cluster ovate, dense. Flower-stalks glutinous, rough, the length of the corolla. Anthers prominent, orbicular.—Gathered by Mr. Menzies on the west coast of North America. Michaux says his plant is found from Quebec to lake Mistassins. There is no room to suppose the latter different from our's, though the *Narthecium glutinosum* of Mr. Gawler, Curt. Mag. t. 1505, is very decidedly so, being a real and evident *Narthecium*, not, like Michaux's, a *Tofieldia*. Pursh calls it *N. americanum*, p. 227, which name, though not one of the best, we would substitute for *glutinosum* in our article NARTHECIUM, the plant not being glutinous. All reference to Michaux and his observations in that place are to be erased. The plant is, according to Pursh, a native of boggy fields and woods, on the pine-barrens, as they are termed, of New Jersey, flowering in June and July.

Our *Tofieldia glutinosa* has a tuberos horizontal root, with long simple fibres. Stem a foot high, angular, roughish all over with short glandular hairs, especially for two inches from the summit. Leaves few, almost entirely radical, four or five inches long, narrow, ribbed, smooth, except a little roughness towards the point. Cluster about an inch in length, of twelve or fourteen pale-yellow flowers, on hairy viscid stalks, about a quarter of an inch long, sometimes in pairs, having at the base one or two acute bractæas, one-third that length. Lobes of the calyx shallow. Petals obovate, rather shorter than the stamens. Anthers purplish, nearly

nearly orbicular, pointless. *Germens* ovate-oblong, tapering into longish *styles*, with small *stigmas*. The habit and hue of the plant are very similar to the European *Nartheceum ossifragum* as well as to the *N. americanum* above-mentioned.

7. *T. frigida*. Wintry *Tofieldia*. Kunth Nov. Gen. et Sp. Pl. v. 1. 267.—Cluster lax, partly scattered. Flower-stalks smooth, twice the length of the bractæas. Petals rather acute. Stem smooth, with three distant ovate leaves towards the top.—Native of lofty summits of the Andes, in the kingdom of Quito, between Loxa and the village of Ona, where it was found, by the celebrated travellers Von Humboldt and Bonpland, flowering in December. Having seen no specimen of this, we can only extract its characters from the description of our able friend Mr. Kunth, who unluckily was not acquainted with the technical differences of the other species, so that his specific character answers nearly equally well to any one of the genus. The root is perennial, perpendicular, branched. Stem about a foot high, round, smooth, bearing in its upper part three ovate, acute, smooth, distant leaves, called by Mr. Kunth *bractæas*. Radical leaves two-ranked, sword-shaped, ribbed, smooth, rigid, three or four inches long. Cluster (erroneously termed *spica*) solitary, erect, two inches long. Flowers on solitary partial stalks, which are smooth, round, two lines in length, with an ovate acute *bractæa*, half as long, at the base of each. Calyx in three deep, ovate, acute segments, one-fourth as long as the oblong, sharpish, striated, whitish petals. Stamens shorter than the corolla, smooth, with oblong upright anthers. *Germens* combined. The present species may perhaps be nearest akin to our *T. stenopetala*, differing essentially in having shorter *bractæas*, to say nothing of other distinctions, which the reader will detect by the above description.—The author speaks of *Tofieldia* as monogynous, taking the *styles* for *stigmas*, and not adverting, as it appears, to the partial separation of either the *germens* or *capsules*. Hence we must conclude that this separation is here less remarkable than in the other species, which brings the plant in question nearer to *Helonias*, the *calyx* being its only, though all-sufficient, distinction.

TOFSALA, in *Geography*, a town of Sweden, in the government of Abo, on an island; 20 miles W.N.W. of Abo.

TOFT, TOFTUM, or *Tofia*, in our *Law-Books*, a parcel of land, or a place where a messuage hath stood, but is decayed, or casually burnt, and not re-edified.

TOFT also signifies a grove of trees.

TOFTA, in *Geography*, a small island in the Baltic, E. of the island of Aland. N. lat. 60° 13'. E. long. 20° 7'.

TOFTS, KATHARINE, in *Biography*, an English singer of great renown on our stage at the beginning of the last century. In 1703, she sung at a subscription concert in Lincoln's-Inn theatre, several Italian and English songs. This lady was the constant rival of Margarita de l'Epine.

In 1704, she sung at the subscription music in Drury-lane playhouse; and soon after, signora Margarita sung for the first time at the same theatre. At her second appearance, there was a disturbance while she was singing, which, from the natural, and, it is to be feared, not uncommon effects of rival malice, was suspected to have been created by the emissaries of Mrs. Tofts; an idea the more difficult to eradicate, as the principal agent had happened to live with that lady as a servant. But as the law of retaliation is frequently practised on the like occasions by the injured party, it was thought necessary, a few days after, to insert a paragraph and letter in the Daily Courant, February 8, 1704, in vindication of Mrs. Tofts.

She was the principal singer in Clayton's *Arfinoe*, in

1705, the first opera attempted in our country and language on the Italian model. See CLAYTON.

Mrs. Tofts was likewise the heroine of the famous opera of Camilla, of Addison's *Rosamond*, set by Clayton, and Thomyris, adjusted to Italian music, and wholly to English words, till the arrival of Valentini, in 1707, the first male soprano singer that ever appeared on our stage; when Camilla and Thomyris were performed, half in English and half in Italian. And even after the arrival of the celebrated Nicolini, when a new opera, entitled *Pyrrhus and Demetrius*, was brought on the stage in 1708, in which almost all the characters were filled up by Italians, Mrs. Tofts continued to perform her part in English, as did Ramondon and Cook; but the public seemed perfectly satisfied with the motley performance, which had a run of eighteen nights; and the confusion of tongues, concerning which Mr. Addison is so pleasant in the *Spectator*, seems to have been tolerated with perfect good humour by the public, which, in music as well as words, seemed to care much less about *what* was sung, than *how* it was sung.

After the year 1709, when the whole opera, poetry, musical composition and performers were Italian, Mrs. Tofts, who seems to have endeared herself to an English audience by her voice, figure, and performance, more than any preceding singer of our country, retired.

Colley Cibber, though he does not speak of music *en connoisseur*, and, as an English actor and patentee of a theatre, was an enemy to Italian operas and Italian singers upon a principle of self-defence, probably gives us the general and genuine opinion of his acquaintance concerning Mrs. Tofts, who, he says, had her first musical instructions in her own country, "before the Italian taste had so highly prevailed, and was then not an adept: whatever defect the fashionably skilful might find in her manner, she had, in the general sense of her hearers, charms that few of the most learned singers ever arrive at. The beauty of her fine proportioned figure, and exquisitely sweet silver-tone of voice, with peculiar rapid swiftness of her throat, were perfections not to be imitated by art or labour."

This performer had songs given to her in all styles; her compass, however, did not surpass the common limits of a soprano, or treble voice. With respect to her execution, of which we are still enabled to judge by the printed copies of her songs, it chiefly consisted in such passages as are comprised in the shake, as indeed did that of most other singers at this time.

Mrs. Tofts quitted the stage in 1709. The talents of this singer and of Margarita de l'Epine gave rise to the first musical factions which we hear of in this country. According to Hughes, author of the *Siege of Damascus*, their abilities were disputed by the first people in the kingdom.

"Music has learn'd the discords of the state,
And concerts jar with Whig and Tory hate.
Here Somerset and Devonshire attend
The British Tofts; and ev'ry note commend;
To native merit just, and pleas'd to see
We've Roman arts, from Roman bondage free.
There fam'd l'Epine does equal skill employ,
While list'ning peers crowd to th' ecstatic joy:
Bedford to hear her song his dice forsakes,
And Nottingham is raptur'd when she shakes;
Lull'd statesmen melt away their drowsy cares
Of England's safety, in Italian airs."

Although it is publicly insinuated in the *Tatler*, for Thursday, May 26, 1709, that Mrs. Tofts was insane, it seems doubtful whether we are to take this account literally, or whether

whether sir Richard Steele had not recourse to invention, or at least exaggeration, in order to throw a ridicule on opera quarrels in general, and on her particular disputes at that time with the Margarita or other female singers. See Tatler, N^o 20.

After quitting the stage, by which she is said to have acquired a considerable fortune, she married Mr. Joseph Smith, who was afterwards appointed consul at Venice, where he resided till the time of his death, about the year 1770. He was a great collector of books and pictures, and a patron of the arts in general.

TOGA, in *Ancient Geography*, a town of Asia, in Greater Armenia. Ptol.

TOGA, in *Antiquity*, a wide woollen gown, or mantle, without sleeves, used among the Romans, both by men and women.

In process of time, none wore the toga but lewd women: whence that of Horace, *in matrona, ancilla, pectusve togata*. Lib. i. sat. ii. ver. 63.

The toga was of divers colours, and admitted of various ornaments: there was that called *toga domestica*, worn within doors; *toga forensis*, worn abroad; *toga militaris*, used by soldiers, tucked up after the Gabinian fashion; and *toga picta*, or *triumphalis*, wherein the victorious triumphed: this was embroidered with palms: that without any ornaments was called *toga pura*.

The *toga picta*, &c. was an ancient habit of the Etruscans, and not brought to Rome till after Tarquinius Priscus had subdued the twelve states of that nation.

The toga was sometimes worn open, and called *aperta*; sometimes girt or tucked up, called *præcineta*; and this cincture or girding, again, according to Sigonius, was of three kinds; *laxior*, or the loose kind, where the tail trailed on the ground; *adstrictior*, the close kind, wherein it did not reach so low as the feet; and *Gabinia*, where one of the skirts or lappets was girt round the body.

Sigonius distinguishes the several togæ, or Roman gowns, into *pura*, *candida*, *pulla*, *picta*, *prætexta*, *trabea*, and *paludamentum*. See PRÆTEXTA, PALUDAMENTUM, &c.

The *toga pura* was also called *virilis*. Kennet's Rom. Ant. part ii. c. 8.

TOGA is sometimes used metaphorically for peace. See TROPE.

TOGÆ, *Jus*, or privilege of the toga, was the same with the privilege of a Roman citizen, *i. e.* the right of wearing a Roman habit, and of taking, as they explain it, fire and water through the Roman empire.

TOGAWADY, in *Geography*, a town of Hindoostan, in Baramaul; 7 miles S. of Sankerydurgam.

TOGDA, or TODGA, a town and district of Africa, in the country of Sugulmeffa; 50 miles W. of Sugulmeffa.

TOGEBAUT, a town of Persia, in the province of Irac; 81 miles N. of Ispahan.

TOGETHER, in *Sea Language*, the order given to the men in the exercises of heaving, rowing, twisting, &c. to act all in concert, or at the same instant.

TOGGEL, in a *Ship*, a small wooden pin, about five or six inches long, and usually tapering from the middle toward the extremities. It is used to fix transversely in the lower part of a tackle, in which it serves as a hook whereby to attach the tackle to a strop, slings, or any body in which the effort of the tackle is to be employed.

There are also toggels of another kind, employed to fasten the top-gallant sheets to the span, which is knotted round the cap at the top-mast-head. FALCNER See BECKETS.

TOGGENBURG, in *Geography*, a county of Swit-

zerland, dependent on the abbey of St. Gal, bounded on the N. by the territory of St. Gal, on the E. by the canton of Appenzell, on the S. by the county of Sargans and the territory of Caster, and on the W. by the canton of Zurich. In its natural quality it resembles Appenzell and the other cantons, and, being full of fertile Alps, abounds in numerous breeds of cattle. Till the year 1436, this county had its own counts; the last of whom carried his indulgence to his vassals so far, as to grant them such privileges as nearly amounted to a state of absolute freedom: accordingly, on his demise in the above year, they entered into a close alliance with the cantons of Schwytz and Glaris, which alliance was confirmed in 1440. Afterwards, the county descended to the barons of Raron; but, in 1468, they sold it to Ulrich VIII. abbot of St. Gal, who, in 1469, entered into a perpetual league with the cantons of Schwytz and Glaris, and likewise gave his sanction to the former compact between the inhabitants of the county and the said cantons. In the beginning of the eighteenth century, the Toggenburgers, resenting the illegal and oppressive exactions of abbot Leodegarius, applied for assistance to their allies, who readily granted it; and, in 1707, Zurich and Bern also declared, that they would maintain the county of Toggenburg in the secure enjoyment of its rights and liberties, against all illicit violence whatsoever. On this the people began to assert their rights, and, in 1707, in a solemn landesgemeine, held at Watweil, renewed their federal oath, and erected three councils, named the great, lesser, and privy, which are composed of an equal number of members of both sects. The intestine commotions here continued however to increase, till, in 1712, they broke out into open war, in which Zurich and Bern sided with the county, and Schwytz and Glaris with the abbot. In 1718, at Baden, in the Argau, an accommodation, confirming the liberties of the county, was brought about between the new abbot and the cantons of Bern and Zurich. Pursuant to this peace, the abbot and prince of St. Gal both is, and bears the title of, natural sovereign, and territorial lord of the county of Toggenburg; and the people are to take the accustomed oath to him, and to pay him suitable services, but without any violation of their rights and liberties.

TOGLUPOUR, a town of Hindoostan, in the subah of Delhi; 15 miles W.N.W. of Panniput.

TOGOMI, a town of Japan, in the island of Nippon; 80 miles N.W. of Meaco.

TOGOSOHATCHEE CREEK, a branch of the Oakmulgee river, in the state of Georgia.

TOGRIN, CAPE, a cape at the mouth of the river Sierra Leone.

TOGULA, among the Romans, a narrow kind of toga, used by the poorer sort of people.

TOHBA, a denomination given to a class of priests in Thibet. Youth intended for the monastery of Teschooloomboo, are, upon their first being admitted, at the age of eight or nine years, into the establishment, called "Tuppa," and they are then occupied in receiving the instructions suited to their age, and the duties for which they are designed. At fifteen they are usually admitted into the order of Tohba, the first step in their religious class, and after due examination, they are advanced from the order of Tohba to that of Gylong, between the age of twenty-one and twenty-four. See GYLONG.

TOHOTCHIE HOTUN, in *Geography*, a town of Chinese Tartary, in the country of Hami; 30 miles N.W. of Hamilhotun.

TOJIE, a town of Hindoostan, in Candish; 10 miles N. of Hurdah.

TOIKO,

TOIKO, a town of Japan, in the island of Niphon; 80 miles E.S.E. of Jedo. N. lat. 36° 5'. E. long. 140° 40'.

TOILES, snares or nets set by hunters for catching of wild beasts; as deer, &c.

TOILET, a fine covering, of linen, silk, or tapestry, spread over the table in a bed-chamber, or dressing-room, to undress and dress upon.

The dressing-boxes, in which are kept the paints, pomatums, essences, patches, &c. the pin-cushion, powder-box, brushes, &c. are esteemed parts of the equipage of a lady's toilet.

That of the men consists of comb-case, brushes, &c.

To make a visit to one at his toilet, is to come to entertain him while he is dressing or undressing.

Sattin, lace, velvet, brocade, point de France, &c. are now ordinarily used for toilets: anciently they were made much plainer: whence the name, which is formed from the French, *toilette*, a diminutive of *toile*, any thin stuff.

TOISE, or **FATHOM**, a long measure in France, containing 6 feet, the foot being 12 inches, the inch 12 lines, subdivided into 12 points: 76 French feet are equal to 81 English feet, or, more accurately, 4000 French feet equal 4263 English feet.

TOISON d'Or, a term, in *Heraldry*, for a golden fleece, which is sometimes borne in a coat of arms.

TOISSEY, in *Geography*, a town of France, in the department of the Ain, near the Chalarogne and Saône, which unite about half a mile from the town; 18 miles W. of Bourg-en-Bresse.

TOJUCA, a river of Brazil, which runs into the Atlantic, S. lat. 27° 44'.

TOKA, a town of Hindoostan, in the circar of Aurungabad; 33 miles S.W. of Aurungabad.

TOKAI, a river of Bucharia, which runs into the Gihon, near Hefdrasp.

TOKARESTAN, a district of Grand Bucharia, situated to the eastward of Balk.

TOKAY, a town or rather village of Hungary, situated at the foot, and to the E. of a high hill, close by the conflux of the river Bodrug with the Theis or Tibiscus. The inhabitants are chiefly either Hungarians of the Protestant religion, or Greeks, who came originally from Turkey, but have been long settled here, for the purpose of carrying on the wine-trade. The hills on which the vine grows lie all to the W. of the river Bodrug, and beginning close by the town of Tokay, extend westward and northward from thence, and occupy a space of perhaps ten English miles square; but they are interrupted and interspersed with many extensive plains, and several villages. Near some of these, particularly Tabia and Tarczal, the wine is better than that which is produced on the hill of Tokay; but it all goes under the same name; 98 miles N.W. of Colofvar. N. lat. 48° 10'. E. long. 10° 57'.

TOKAY-Wine, derives its name from the town or village of Hungary, where it is produced. (See the preceding article.) The vineyards extend beyond the forty-eighth degree of northern latitude; the soil where the vines grow is a yellow clayish earth, extremely deep, and interspersed with large loose lime-stones: the exposures most inclining to the south, the steepest declivities, and the highest parts of these, produce the best wine. This wine, so far from its being found in so small a quantity as never to be genuine, unless when given in presents by the court of Vienna, is a common desert wine in all the great families at Vienna and in Hungary, and is very generally drunk in Poland and Russia: nor is the Tokay wine altogether the property of the crown, but many of the German and Hungarian nobility, as well as gen-

tlemen, and even peasants, have vineyards at Tokay. The grapes are all white, and the vintage commonly begins about the 28th of October, sometimes as late as the 11th of November. There are four sorts of wine made from the same grapes, distinguished at Tokay by the names of essence, auspruch, maßsach, and the common wine.—The essence is made by picking out the half-dried and shrivelled grapes, and putting them into a perforated vessel, where they remain as long as any juice runs off by the mere pressure of their own weight. This is put into small casks. The auspruch is made by pouring the expressed juice of the grapes from which the former had been picked on those that yielded the essence, and treading them with the feet. The liquor thus obtained stands for a day or two to ferment, and then is poured into small casks, which are kept in the air for about a month, and afterwards put into the cellars. The same process is again repeated by the addition of more juice to the grapes which have already undergone the two former pressures, and they are now wrung with the hands; and thus is had the maßsach. The fourth kind is made by taking all the grapes together at first, and submitting them to the greatest pressure: this is chiefly prepared by the peasants.

The essence is thick, and very sweet and luscious; it is chiefly used to mix with the other kinds. The auspruch is the wine commonly exported, and which is known in foreign countries by the name of Tokay. The goodness of it is determined by the following rules. The colour should neither be reddish nor very pale, but a light silver: in trying it, the palate and tip of the tongue should be wetted without swallowing it, and if it manifest any acrimony to the tongue, it is not good; but the taste ought to be soft and mild: when poured out, it should form globules in the glass, and have an oily appearance: when genuine, the strongest is always of the best quality: when swallowed, it should have an earthy astringent taste in the mouth, which is called the taste of the root. All Tokay wine has an aromatic taste, which distinguishes it from every other species of wine. It keeps to any age, and improves by time; but is never good till about three years old. It is the best way to transport it in casks; for when it is on the seas, it ferments three times every season, and thus refines itself. When in bottles, there must be an empty space left between the wine and the cork, otherwise it would burst the bottle. A little oil is put upon the surface, and a piece of bladder tied over the cork. The bottles are always laid on their sides in sand. Phil. Trans. vol. lxxiii. part ii. p. 292, &c.

TOKE, in *Geography*, a town of Bengal; 35 miles N.N.E. of Dacca.

TOKEN-BESSEYS, a cluster of small islands in the East Indian sea. S. lat. 6°. E. long. 123° 36'.

TOKENS, in *Pestilential Cases*, those livid spots which appear in the several stages of the disease, and are certain forerunners of death. They generally appear only under the most desperate circumstances, and when the patient would otherwise be declared dying; but Hodges gives us instances where they appeared before any other symptoms of the disease, and came out without any pain or trouble; yet even in these cases the person always died. These tokens are the mark by which the searchers conclude of the cause of the death of the person, and are the rule for ordering the house to be shut up, to prevent the spreading of the disease. But the nurses, and other crafty people, have a way of disguising the symptom after death; by covering the body with wet and cold sheets. These strike in the spots, so that the person may be thought to have died by some other disease.

TOKENS, *False*, in *Law*. See **FALSE**.

TOKENS, in *Coinage*, coins in the reign of queen Elizabeth,

struck in the cities of Bristol, Oxford, and Worcester, and also by about 3000 tradesmen and others; upon returning which to the issuer, he gave current coin, or value, for them, as desired. In the succeeding reign, on the 19th of May, 1613, king James's royal farthing tokens commenced by proclamation. These were not forced upon the people as farthings or established coin, but merely as pledges or tokens, for which government was obliged to give other coin if required. Their legend was the king's common titles running upon each side. These pieces were not favourably received, but continued in a kind of reluctant circulation through the whole of this reign, and the beginning of the succeeding. In 1635, Charles I. struck those with the rose instead of the harp. But the vast number of counterfeits, and the king's death in 1648, put an utter stop to their currency; and the tokens of towns and tradesmen again took their run, increasing prodigiously till the year 1672, when farthings properly so called were first published by government. These town-pieces and tradesmen's tokens, together with those of the time of queen Elizabeth, are collected by some antiquaries with great avidity. Similar tokens, says Pinkerton, are to this day current in Scotland, both of copper and tin, principally used by the bakers and grocers; farthings not being very common in that country.

In 1804, the bank of Ireland bought in a large quantity of depreciated silver coin; and, as a substitute, issued Spanish dollars, newly stamped, at 6s. Irish, and also fractions of the dollar, which had been minted for the occasion at the Tower of London, consisting of five-penny, ten-penny, and thirty-penny pieces Irish, being exactly $\frac{1}{4}$, $\frac{1}{2}$, and $\frac{3}{4}$ of the dollar. All these coins are called Bank tokens, the Bank having engaged to receive them again at the issued price, and they have been declared a legal tender in the payment of taxes: their intrinsic value may be known from that of the dollar. In 1809, a new silver coinage was minted at the Tower of London for the colonies of Essequibo and Demerary, consisting of pieces of 3, 2, 1, $\frac{1}{2}$, and $\frac{1}{4}$ guilders: the larger piece weighs 15 dwt., and is 1 oz. 6 dwt. worse than English standard. Its value therefore is 3s. 5d. sterling, or, computing it as the dollar is now rated in the West Indies (*i. e.* at 4s. 8d.), its value is 3s. 8 $\frac{1}{2}$ d. and the smaller pieces in proportion. They are marked on the reverse "Colonies of Essequibo and Demerary Token," and the king's is on the obverse. The exchange with London should be about 12 guilders for 1l. sterling, but varies considerably above this, even to 20 guilders, and upwards. Kelly's Cambist.

TOKIS, in *Geography*, a town of Japan, in the island of Nippon; 40 miles N.N.E. of Meaco.—Also, a town of Japan, in the province of Ximo; 15 miles N.N.W. of Nangafaki.

TOKI-TAO, a small island near the coast of China. N. lat. 38° 7'. E. long. 120° 39'.

TOKORARI. See TOCORARY.

TOKTABA, a town of Bootan; 50 miles N. of Beyhar.

TOL, in *Law*, a term signifying to defeat, or take away. From the Latin, *tollere*, which signifies the same.

Thus, *to tol the entry*, is to take away the right of entry.

TOL *Peden Penwith*, in *Geography*, a cape on the S. coast of the western extremity of Cornwall; 3 miles S.E. of Land's End. N. lat. 50° 4'. W. long. 5° 36'.

TOLA, in *Commerce*, a weight for gold and silver at Bombay, Surat, and other places in India: at Bombay, the tola contains 40 valls, 100 gonze or Bombay grains, or 600 chowes. The tola is equal in weight to the silver rupee;

24 tolas make 1 feer, and 32 tolas 13 valls = 1 lb. troy. At Surat, the tola contains 32 valls or 96 ruttees: 82 $\frac{1}{2}$ valls make 1 oz. troy, and therefore 31 tolas 1 lb. troy nearly.

TOLABO, CAPE, in *Geography*, a cape on the E. coast of Cekbes. S. lat. 0° 45'. E. long. 122° 50'.

TOLAGO BAY, a bay on the N.E. coast of the northern island of New Zealand, in the South Pacific ocean, discovered by captain Cook in the year 1769. It is moderately large, and has from seven to thirteen fathom, with a clean sandy bottom and good anchorage, and is sheltered from all winds except the north-east. On the south point lies a small but high island, so near the main as not to be distinguished from it. Close to the north end of the island, at the entrance into the bay, are two high rocks; one of which is round, like a corn-stack, but the other is long, and perforated in several places, so that the openings appear like the arches of a bridge. Within these rocks is a cove, convenient for wood and water. Off the north point of the bay is a pretty high rocky island; and about a mile without it, are some rocks and breakers. The tide flows at the full and change of the moon, about six o'clock, and rises and falls perpendicularly from five to six feet. Captain Cook saw no four-footed animals, nor the appearance of any; either tame or wild, except dogs and rats, and these were very scarce: the people eat the dogs, as at Otaheite, and adorn their garments with the skins. He climbed many of the hills, hoping to get a view of the country, but could see nothing from the top except higher hills, in a boundless succession. The ridges of these hills produce little besides fern; but the sides are most luxuriantly clothed with wood and verdure of various kinds, with little plantations intermixed. In the woods he found trees of above twenty different sorts, and carried specimens of each on board; but there was nobody to whom they were not altogether unknown. The tree cut for firing was somewhat like the maple, and yielded a whitish gum. Another sort was found of it, of a deep yellow, which might be useful in dyeing. One cabbage-tree was met with, and cut down for the cabbages. The country abounds with plants, and the woods with birds in an endless variety, exquisitely beautiful, and of which none of them had the least knowledge. The soil of both the hills and vallies is light and sandy, and very fit for the production of all kinds of roots; though none were seen except sweet potatoes and yams. S. lat. 38° 22'. W. long. 181° 15'.

TOLAND, JOHN, in *Biography*, a writer on subjects of political and religious controversy, was born in the year 1669, in Ireland, near Londonderry; and his parents, of a good family, were Roman Catholics. Educated in the principles of his family, he renounced them before he attained the age of sixteen years, and became a zealous opposer of popery. Accordingly he completed his education in Scotland, and having spent three years in the university of Glasgow, removed to Edinburgh, where he graduated M. A. in 1690. From Edinburgh he removed to London, and became acquainted with some respectable dissenters, who enabled him to pursue his studies for two years more at Leyden. On his return to London, he visited Oxford, and here he collected materials for the execution of some literary projects: one of which was a dissertation in order to prove that the common narrative of the death of Regulus was a fable. In 1696 he published at London his "Christianity not mysterious; or a Treatise shewing that there is nothing in the Gospel contrary to Reason, or above it; and that no Christian Doctrine can be properly called a Mystery." This publication caused an alarm, and not without reason, among

among Christians of all denominations, by whom it was regarded as an attempt to overthrow revealed religion. At home and abroad it excited attention, and the advocates of Christianity concurred in the defence of their religion against what they conceived to be an attack upon it. The magistrates, also, intruded into this controversy, and procured a presentment by the grand jury of Middlesex. The author withdrew from the storm which seemed to be gathering into his own country; but the obnoxious character of his book had excited prejudices against him. Toland, as we learn from the correspondence between Mr. Molyneux and Mr. Locke on the subject, does not seem to have acted with that moderation and prudence which might reasonably have been expected in his circumstances. His manner of defending and propagating his opinions gave just offence even to those who entertained some degree of respect for his talents and learning; and was condemned by those who were avowed advocates of rational liberty and enemies to every kind of persecution. From another quarter he experienced a severity of treatment, which his own misconduct had provoked, but which, in this more enlightened and liberal period, none, we presume, will undertake to justify. In a reply to Toland's book, by Mr. Peter Brown, senior fellow of Trinity college, the civil magistrate was called upon to interfere; accordingly the grand jury of Dublin made a presentment of the book: the parliament of Ireland voted it to be burnt by the common hangman, and issued an order that the author should be taken into custody by the serjeant at arms, and prosecuted by the attorney-general. Toland, universally shunned by his acquaintance, and reduced to pecuniary distress, left the country, and returned to England. While some disapproved the violence of this proceeding, others justified it; and Dr. South, in particular, highly commends the Irish parliament for having, "to their immortal honour, presently sent him (Toland) packing, and, without the help of a faggot, soon made the kingdom too hot to hold him." On the spirit which dictated this language we make no comment. Toland, upon his arrival in London, published an account of his treatment in Ireland, and renouncing communion with the Dissenters, declared himself a latitudinarian, or one who would comply with the religious worship of any class of Protestants, whose differences were not, in his estimation, of sufficient importance to justify disturbing the peace of a nation. He then directed his attention to other topics; and in 1698 he published a pamphlet, intitled "The Militia reformed," in which he proposed to substitute that species of armament to a standing army. In the same year he wrote a "Life of Milton," to be prefixed to an edition of his prose works, and which was also printed separately. In this preface he opposed the notion then prevalent, that the "Icon Basilike" was written by Charles I.; and from the consideration of this imposture, as he pronounced it to be, he digressed to the consideration of the spurious works that had been ascribed to Christ and his apostles. Against a host of political and religious adversaries, he defended himself in a treatise intitled "Amyntor;" in which he gave a complete history of the "Icon Basilike," and also a catalogue of such primitive writers, who were judged by him to be spurious. As he was supposed in the discussion of this latter topic to impugn the authenticity of the received canon of Scripture, he drew forth replies from some of the ablest advocates of Christianity, and particularly Mr. (afterwards the highly celebrated Dr.) Samuel Clarke.

In 1699, Toland was engaged by the duke of Newcastle to publish "Memoirs of Denzil Lord Holles;" and in the following year by Mr. Robert Harley, afterwards earl of Oxford, then a Whig, to give a new edition of

Harrington's "Oceana." When the Act of Succession was passed, on occasion of the death of the duke of Gloucester in 1701, he published "Anglia Libera," being an explanation and eulogy of this act; and he accompanied the earl of Macclesfield, who was deputed to carry it to Hanover, and had the honour of presenting his book to the electress Sophia, and of kissing her hand on the occasion. At Berlin, which he visited, he held a dispute, before the queen of Prussia, with the learned Beaufobre, on the authority of the books of the New Testament; an account of which was sent by the latter to the "Bibliothèque Germanique." Upon his return to England in 1704, he published "Letters to Serena," (meaning the queen of Prussia,) on the origin and force of prejudices; the history of the soul's immortality among the heathens; the origin of idolatry; and remarks on Spinoza's philosophy. These letters were animadverted upon by Wotton, and by the author of the Divine Legation. In 1708 he published at the Hague two Latin dissertations, entitled "Adei-fidæmon, sive Titus Livius a Superstitione vindicatus," and "Origines Judaicæ, sive Strabonis de Moyse et Religione Judaica Historia breviter illustrata." In 1718 he published "Nazarenus; or Jewish, Gentile, or Mahometan Christianity," &c. in which he endeavours to shew that the Jewish converts were to observe their own law throughout all generations, &c. Two years afterwards appeared a Latin tract, entitled "Pantheiticon: sive Formula celebrandæ Sodalitatis Socraticæ, &c.:" a work which has subjected its author to the charge of atheism, and in consequence of which he was unjustly accused by Dr. Hare with having composed a profane prayer to Bacchus in his character of Pantheist. In the same year he published his "Tetradymus," on the pillar of cloud and fire that guided the Israelites; on the exoteric and esoteric philosophy of the ancients; on Hypatia, the female philosopher; and a defence of his Nazarenus against Dr. Mangey. To this work he annexed an account of his conduct and sentiments, solemnly professing his preference of the Christian religion, pure and unmixed, to all others.

Toland's health was now declining, and being in low circumstances, lord Moleworth assured him that he should never want, while he himself lived. However, his disease baffled all remedies, and his life closed on the 11th of March, 1722, in the 53d year of his age. He manifested a considerable degree of resolution and patience during the progress of his illness; replying to one who asked him if he wanted any thing, "I want nothing but death;" and after taking a calm leave of his friends, saying to them that "he was going to sleep." In an epitaph which he prepared for himself, he expresses that confidence and self-applause which belonged to his character. He closes with these words: "Spiritus cum æthereo patre, a quo prodiit olim, conjungitur; corpus item; naturæ cedens, in materno gremio reponitur. Ipse vero æternum est resurrecturus, at idem futurus Tolandus nunquam." His posthumous works were published in 2 vols. 8vo. in 1726, and again in 1747, with an account of his life and writings, by Des Maizeaux. Biog. Brit.

TOLANORE, in *Geography*, a town of Hindoostan, in the Carnatic; 5 miles N. of Volconda.

TOLASTRA REGIO, in *Ancient Geography*, a country of Asia, in Galatia. Ptolemy.

TOLBIACUM, a town of Gallia Belgica, according to Tacitus; situated on the route from Trevari to Colonia Agrippina.

TOL-BOOTH, or TOLL-BOOTH, a place in a city, where goods are weighed, to ascertain the duties or import on them.

TOLCESTER, TOLCESTRUM, in our *Old Writers*, an old excise, or duty paid by the tenants of some manors to the lords, for liberty to brew and sell ale.

TOLCKSDORF, in *Geography*, a town of Prussia, in Ermeland; 12 miles S.E. of Frauenburg.

TOLEDO, in *Biography*. See ALVA.

TOLEDO, in *Geography*, a city of Spain, in New Castile, on the Tagus, the see of an archbishop, and an university, founded in the year 1475. The origin of Toledo is uncertain; it is only known to have been a Roman colony, and made the depository of the treasures sent to Rome. From the Romans it passed under the dominion of the Goths; Leovigild resided there and embellished the city, which became more considerable under his successors. The Moors took Toledo in 714, and reigned there till 1085, when it was taken from them by Alphonso VI., who styled himself emperor of Toledo, whence it took, and has preserved, the title of royal and imperial. Toledo, as is well known, was formerly famous for the exquisite temper of the sword-blades made there; and the genuine ones that still remain are sold at an exorbitant price. It is said that the secret of hardening them has been again recovered; and experiments have been made with blades lately fabricated there which seem to justify this assertion. When one of these has undergone the operation of tempering, if it be in the least notched, by striking with it several violent blows on an iron head-piece, it is rejected: almost all that are made here, it is said, will stand this proof. Two centuries ago, Toledo contained more than 200,000 inhabitants, but now scarcely 30,000. When a house falls to decay, it is never rebuilt; and in 20 years more, this city will be little else than a heap of ruins. Toledo is built upon rocks, and commanded by eminences which seem to present the image of sterility; yet, in the midst of these precipices, the traveller finds, to his surprise, several fertile and charming situations, impenetrable to the burning rays of the sun. These places are called *Cigarrales*. Several councils have been held at Toledo, particularly one in 633, in which it was declared unlawful and unchristian to force people to believe, seeing it is God only who hardens, and shews mercy to whom he will; but by another council in a few years after, they highly commended their monarch for persecuting the Jews. In 681 it was decreed, that the archbishop of Toledo should have power to create bishops throughout Spain in the king's absence, and confirm those made by the king. In 1355, it was seized by Henry and Frederick, the bastards, brothers of king Peter, who robbed all the Jews, and murdered about 1000 of them; 32 miles S.S.W. of Madrid. N. lat. 39° 56'. W. long. 4° 18'.

TOLEN, a town of Norway; 22 miles W. of Berga. —Also, an island belonging to the state of Zealand, in the east branch of the Scheldt, separated from the main land of Brabant by a canal, about ten miles in length, and four in breadth. It contains two towns, Tolen and St. Martyn's Dyck, and several villages. Tolen, the capital, from whence the island itself is named, is a handsome town, and ranks as fourth in the assembly. The name of it is derived from the toll which was formerly paid here by order of the counts of Zealand. It is fortified with seven bastions, and the states have caused a fort, called Suckenburg, to be built on the other side of the river, so that it is now one of the strongest frontier towns of the state of Zealand. The stadt-house is an old building, which makes a good show. The arsenal is situated at the entrance of the small harbour; there is also a magazine for powder. The church is built in the figure of a cross, and is an extraordinary piece of architecture; 4 miles N.W. of Berg-op-Zoom. N. lat. 51° 36'. E. long. 3° 58'.

TOLENTINO, a town of the Popedom, in the marquisate of Ancona, on the Chiento, the see of a bishop,

united to Macerata. It is only remarkable for being the depository of the body of St. Nicholas, where the arm, by bleeding afresh, prognosticates when any signal calamity is to befall Italy; 18 miles W. of Fermo. N. lat. 43° 10'. E. long. 13° 18'.

TOLENTINUM, in *Ancient Geography*, a town of Italy, in Picenum, S.W. of Ricina.

TOLENUS, a river of Italy, in the country of the Marfi.

TOLERATION, in *Religion*, a term which has engaged much attention in the disputes among Protestants.

M. Bafnage, and some others, distinguish *civil toleration* from *ecclesiastical*. The latter allows of different, and even opposite sentiments in the church; and the first permits them in civil society.

By civil toleration, is meant impunity and safety in the state for every sect which does not maintain any doctrine inconsistent with the peace and welfare of the state. This *civil* or *political* toleration, implies a right of enjoying the benefit of the laws, and of all the privileges of the society, without any regard to difference of religion.

Ecclesiastical toleration is an allowance of certain opinions, which, not being fundamentals, do not hinder those who profess them from being esteemed members of the church. But as to the quality and number of these fundamental points, they never could, nor in all probability ever will be agreed upon.

In order to discover the genuine principles of toleration, it is necessary to consider that, antecedently to the formation of civil societies, mankind possess certain rights, independent of all human grant, not derived from any compact, and which are therefore to be acknowledged as the rights of human nature. A right to judge for themselves in points of religion is one of these rights; which, whilst it authorizes every individual to claim the exercise of this privilege to himself, obliges him to allow it in the same extent to all about him, and establishes one uniform regulation for his behaviour toward others, and their behaviour toward him: *e.g.* no apprehensions of the truth and certainty of any person's religious sentiments can justify him in attempting to impose them on his neighbour; for the same right of judgment which any one can claim, belongs, on the same principle, equally to all, and ought to be equally sacred and inviolable in all; and no reason can be alleged by him for taking the religious liberty of others from them, but what will, at the same time, equally destroy his own title to it. The injustice of similar encroachments upon him from others follows from the same principle, and with the same evidence.

Whether the claim of such a liberty of judgment in religion for ourselves is weakened by men's entering into civil society, is the next object of consideration.

The great end of government is to protect the subjects of it from the injuries to which they were exposed in a state of nature; and as all injuries imply rights of which they are violations, and the care taken to guard against the violation of these rights is an acknowledgment of the reality and importance of them; it evidently follows, that when they enter into society, if the primary and leading view of government be to prevent or restrain those injuries, to which men were exposed for want of its protection, they carry these rights with them; that they continue to retain them; and that, instead of supposing themselves to be deprived of them, the very design with which they put themselves under the authority of government is to secure them the more firmly. With this view they entrust the preservation of them to common guardians, by whose intervention, it is presumed, they will be more vigorously asserted and more effectually protected, than it is possible they should be in a state where
there

TOLERATION.

there is no common umpire to check the evils of oppression on the one hand, and restrain the no less formidable evils of immoderate resentment on the other.

If we consider what are the rights which men give up to government, when they enter into civil societies, they will be found to be, not those which may most properly be styled the primary rights of human nature; not the right which every man has to live undisturbed, to enjoy the advantages which he justly possesses, and to be left to his freedom in all things not injurious to his fellow-creatures; but the consequential, though equally real and certain right which, where men are not subject to government, every person has to take the assertion of all his rights into his own hands, and correct the infringers of them by the inflicting of such pains, or the use of such other methods of deterring the authors of the wrong, as reason shall warrant for his future security: and, speaking precisely, even these rights are not absolutely extinguished and utterly lost, but suspended by such limitations as the order and well-being of society require, and so long as the succours of government shall be effectual. The primary rights of liberty, safety, and protection from oppression, still subsist in their full vigour. To suppose them abandoned, renounced, and annihilated, or that government can have any right to destroy them, is ascribing to it a right to defeat the end for which it is established, and betray the trust reposed in it. It is, indeed, totally inverting the principle upon which the power of rulers stands, and by which the acts of it ought to be guided.

Man was not made for government, but government for man; and the great object, to which all the operations of it should be directed, is to guard, as much as possible, the equal, impartial ease and freedom of all the subjects of it. To this purpose judge Blackstone observes, that the principal aim of society is to protect individuals in the enjoyment of those absolute rights, which were vested in them by the immutable law of nature, but which could not be preserved in peace without that mutual assistance and intercourse, which are gained by the institution of friendly and civil communities: so that the primary end of human laws is to maintain and regulate these absolute rights of individuals. See GOVERNMENT and *Civil LIBERTY*.

Now of all the rights inherent in human nature, that of thinking for ourselves, and following the conviction of our own judgments in relation to the object of our faith, worship, and religious obedience, is the most sacred, incontestible, and in every view of it, intitled to the most careful protection. The preservation of these is one of the chief, perhaps the first end for which civil societies are instituted, and the rulers of them invested with power: and therefore, in all governments, the rights of conscience should have a principal place assigned them in the care of those, to whom the protection of their fellow-creatures is committed. If the securing of equal, impartial liberty, in all those instances of it in which it is not injurious to others, be so much the object of every equitable, wise, and well-constituted system of laws, that all needless encroachments upon it are deviations from the spirit which ought to be diffused through all laws, and impair the benefit which they ought to confirm, can it be supposed that the rights of conscience ought not to be guarded from violation? Rights of this kind are the last which men can ever be imagined to give up to be modelled at the pleasure of others; nor (as it is argued) is there any one principle connected with their submission to governors in other respects, that can require or justify such a surrender. Does it follow that, because the magistrate is entrusted with authority to decide disputes between us and our fellow-citizens concerning property, he is to determine

points which lie only between God and our own consciences? Because it is allowed to be his office to guard the peace of his subjects, and to inflict punishments for this purpose on those who unjustly disturb it; is it to be taken for granted, that he is to dictate to them what rule of faith they shall adopt, and in what manner they are to worship the Deity; when it is allowed on all hands, that of these things the will of God is the only rule, and that no worship can be acceptable to him, but what is accompanied with the sincere conviction of him who offers it? Besides, it is argued, that such is the nature of this right, and it so stands upon a foundation peculiar to itself, and is distinguished from every other right, that it *cannot* be given up. Property may be resigned, transferred, or submitted to the regulation of others; a man may relinquish his ease, and subject himself to inconveniences, and be not only innocent but laudable; nay, he may sacrifice life itself, and merit the highest applause; but his conscience he cannot resign.

To "prove all things, and hold fast that which is good," is not only a privilege but a duty; an obligation laid upon him by the very nature of religion and virtue, and from which he cannot discharge himself without departing from the principles of both. It must always remain entire to him; nor, while the principles of the most reasonable liberty are allowed to subsist in their due extent, can any attempt be consistently made to take it from him.

From these principles it has been inferred, that toleration, so far from being a matter of mere grace or favour, which government has a right to withhold, grant, abridge, or resume at pleasure, is the acknowledgment and confirmation of a right: not one of those adventitious rights, which are subsequent to the establishment of civil societies, and arise out of the peculiar forms and constitution of it; but of those higher rights which belong to men as such, and which ought to be preserved under all states and governments whatever, as effectually, universally, and impartially as any other right. With regard to the extent of toleration, it is urged, that if liberty of conscience be a right essential to human nature, all penalties in cases merely of a religious nature must be an infringement of a right, and a degree of oppression, though inflicted by a law. Farther, the inquiry concerning the persons entitled to toleration does not depend on the supposed truth or error of the sentiments which men may adopt, but upon the common right, which all men have, to be led in these points by the light of their own minds, and to enjoy all the securities and benefits of society, while they fulfil the obligations of it. All who can give good security to the government under which they live, and to the community to which they belong, for the performance of the duties of good subjects and good citizens, have an undoubted claim to it, and cannot with any just reason be deprived of it. It is not error, but injury to the state, or the individuals who are under the care of it, which justifies the animadversion of the magistrate; and all to whom this cannot be justly imputed, are the objects of his protection.

Archdeacon Paley distinguishes two kinds of toleration: the one *partial*, which is the allowing to dissenters the unmolested profession and exercise of their religion, but with an exclusion from offices of trust and emolument in the state; and the other *complete*, which is the admission of them, without distinction, to all the civil privileges and capacities of other citizens. The justice and expediency of toleration in general is founded by this ingenious writer primarily in its conduciveness to truth, and in the superior value of truth to that of any other quality which a religion can possess. Besides this principal argument for toleration, there are

TOLERATION.

other auxiliary considerations that are important. The restriction of the subject to the religion of the state is a needless violation of natural liberty, and in an instance with regard to which constraint is always grievous. Persecution produces no sincere conviction, nor any real change of opinion; on the contrary, it vitiates the public morals, by driving men to prevarication, and commonly ends in a general though secret infidelity, by imposing, under the name of revealed religion, systems of doctrine, which man cannot believe, and dare not examine: finally, it disgraces the character, and wounds the reputation of Christianity itself, by making it the author of oppression, cruelty, and bloodshed. Our author includes under the idea of religious toleration the toleration of all books of serious argumentation, without deeming it any infringement of religious liberty to restrain the circulation of ridicule, invective, and mockery upon religious subjects.

Concerning the admission of dissenters from the established religion to offices and employments in the public service, which is necessary to render toleration *complete*, doubts, says Dr. Paley, have been entertained with some appearance of reason. In vindication of these doubts, he refers to those who hold religious opinions that are utterly incompatible with the necessary functions of civil government; enthusiasts, who maintain that all distinction of property is abolished by Christianity, and that the gospel enjoins upon its followers a community of goods; and to Quakers or Friends, who believe it to be contrary to Christianity to take up arms. He allows, however, that with the single exception of refusing to bear arms, the various sects of Christians which actually prevail in the world hold no tenet which incapacitates men for the service of the state. It has indeed been asserted, that discordancy of religions, even supposing each religion to be free from any errors that affect the safety or the conduct of government, is enough to render men unfit to act together in public stations. But upon what argument, or upon what experience, is this assertion founded? "I perceive no reason," says this liberal writer, "why men of different religious persuasions may not sit upon the same bench, deliberate in the same council, or fight in the same ranks, as well as men of various or opposite opinions upon any controverted topic of natural philosophy, history, or ethics." For a further account of this author's sentiments on toleration and collateral subjects, see RELIGION, SUBSCRIPTION, and TEST-*Act*.

To the term *toleration*, though it has been adopted by Mr. Locke and several writers of the first distinction, others have objected; alleging that, as words have a considerable influence on opinions, this term appears to be injurious to that religious liberty, which it is designed to import. It implies a *right* to impose articles of faith, and modes of worship; that nonconformity is a crime; and that the *sufferance* (toleration) of it is a matter of favour or lenity. But the nonconformist in every country, whether he be a Christian at Constantinople, a Protestant at Rome, an Episcopalian in Scotland, or a Presbyterian in England, and, we may add, a Catholic in any part of Great Britain, if his rational principles be consonant to his practice, will regard this claim of *right* as usurpation; and will urge, that it has been neither conferred by Jesus Christ, nor delegated by the people. Our Saviour expressly declares, "My kingdom is not of this world;" and his religion was persecuted and oppressed, during the period of its greatest purity and perfection, and when the ministers of it had gifts and powers which are now unknown. The people could not delegate such a right to any man or body of men; for the human mind is so mutable, that no individual can fix a standard of his

own faith, much less can he commission another to establish one for him and his posterity; and this power would be in no hands so dangerous as in those of the statesman or priest, who has the folly and presumption to think himself qualified to exercise it. The use of this term was introduced at a time, when very imperfect notions of religious liberty, and very erroneous ideas of the authority of the civil magistrate in the province of religion, prevailed. In its literal acceptation, it is without doubt objectionable, and incompatible with just views of religious liberty. What human being, however exalted his rank or extensive his influence, can presume to *tolerate* or *suffer* a fellow-creature to worship God according to the dictates of his own conscience, and in that way, or according to those rites and forms, which he apprehends the object of his worship has prescribed; or, in other words, to *tolerate* God in receiving that worship; for to this extreme the argument may be extended. All disabilities and penalties incurred by not worshipping God, and performing other acts of religion, according to any merely human ritual, are in fact prohibitions against man's rendering and God's receiving the homage of the understanding and the heart. Toleration, it has been said, supposes on the part of those who exercise it an authority, to which they have no just claim; and on the part of those who are the objects of it, a certain degree of criminality and culpability, which the persons that exercise the right of toleration descend to excuse and allow. Such are the ideas which some modern writers have entertained on this subject; and accordingly they have wished for a diffuse of the term, as it is founded in, and leads to, error. Liberty, whether it be complete, or partial, is a term well understood; and the use of it is less liable to objection than that of toleration.—See on this subject, Fownes's *Inquiry into the Principles of Toleration*, &c. 8vo. 1772. Locke's *Letters concerning Toleration*, in his *Works*, vol. ii. p. 231, &c. Hoadley's *Rights of Subjects*, passim. Paley's *Philosophy*, vol. ii. c. 10. Percival's *Essay on Truth*, p. 90.

To the account above given of the general principles of toleration, it will be proper to add a few words concerning the state of toleration in our own country. With regard to the Protestant-dissenters in general, see DISSENTERS, NON-CONFORMISTS, and QUAKERS. See also CONVENTICLE, CORPORATION-*Act*, SHERIFF, and TEST.

As for dissenting teachers, or ministers in particular, they were prohibited by 17 Car. II. cap. 2. from coming within five miles of a city, town-corporate, or borough, unless only in passing upon the road, or unless required by legal process, without taking an oath of allegiance therein mentioned, on pain of 40*l.*, and of commitment by two justices, on oath of the offence, for six months. And by 22 Car. II. cap. 1. preaching in any meeting or conventicle, in other manner than according to the practice of the church of England, incurred a forfeiture of 20*l.* for the first offence, and for every other offence 40*l.* Moreover, by 13 & 14 Car. II. cap. 4. no person shall presume to consecrate and administer the sacrament before he be ordained priest, according to the form of the church of England, on pain of 100*l.* But now by 1 W. cap. 18. commonly called the *Act of Toleration*, which, by 19 Geo. III. cap. 44. is declared to be a public act, they are exempted from the penalties of those statutes, upon taking the oaths of allegiance and supremacy, and subscribing the declaration against popery; and also, by 1 W. cap. 18. subscribing the articles of religion mentioned in the stat. 13 Eliz. cap. 12. (which only concern the confession of the Christian faith and the doctrine of the sacraments) with an express exception of those relating to the government and powers of the church,

TOLERATION.

church, and to infant baptism; or if they scruple subscribing the articles, upon making and subscribing the declaration prescribed by stat. 19 Geo. III. cap. 44. professing themselves to be Christians and Protestants, and that they believe the Scriptures of the Old and New Testament, as commonly received among Protestant churches, to contain the revealed will of God, and that they receive the same as the rule of their doctrine and practice; for the register of which they shall pay 6*d.* to the officer of the court and no more, and 6*d.* for a certificate thereof signed by such officer. A farther enlargement of the Toleration Act, in favour of those who impugn the doctrine of the Trinity, was made by 53 Geo. III. c. 160.

Any preacher or teacher, duly qualified, shall be allowed to officiate in any congregation, although the same be not in the county where he was so qualified, provided that the place of meeting hath been duly certified and registered, and such teacher or preacher shall, if required, produce a certificate of his having so qualified himself, and before any justice of such county where he officiates, make and subscribe such declaration, and take such oaths as aforesaid, if required. (10 Ann. cap. 2.) And every such teacher, having taken the oaths, and subscribed as above, shall from thenceforth be exempted from serving in the militia, or on any jury, or from being appointed to bear the office of churchwarden, overseer of the poor, or any other parochial or ward office, or other office in any hundred, city, town, parish, division, or wapentake. For the state of dissenting school-masters, see *SCHOOL-Master*.

In consequence of the Toleration Act, non-conformity is no longer a crime in the eye of the law, and the penalties to which it was obnoxious are not only suspended, but absolutely annulled with regard to those dissenters who are qualified as the act directs. See *Furneaux's Letters to Judge Blackstone*, letter i. See *DISSENTERS*.

For an account of the laws relating to Papists or Catholics, see *PAPISTS*. We shall here state the toleration granted to Catholics by the 31 Geo. III. c. 32. By this act it shall be lawful for persons professing the Roman Catholic religion, to appear in any of the courts at Westminster, or at the general quarter sessions for the county, city, or place where he shall reside, and there in open court, between the hours of nine in the morning and two in the afternoon, take, make, and subscribe the following declaration and oath: *viz.*

“I A. B. do hereby declare, that I do profess the Roman Catholic religion.

I A. B. do sincerely promise and swear, that I will be faithful and bear true allegiance to his majesty king George the Third, and him will defend to the utmost of my power, against all conspiracies and attempts whatsoever, that shall be made against his person, crown, or dignity; and I will do my utmost endeavour to disclose and make known to his majesty, his heirs and successors, all treasons and traitorous conspiracies which may be formed against him or them: and I do faithfully promise to maintain, support, and defend, to the utmost of my power, the succession of the crown; which succession, by an act intitled, *An Act for the further limitation of the crown and better security of the rights and liberties of the subject*, is and stands limited to the princess Sophia, electress and duchess dowager of Hanover, and the heirs of her body, being Protestants, hereby utterly renouncing and abjuring any obedience or allegiance unto any other person claiming or pretending a right to the crown of these realms. And I do swear, that I do reject and detest, as an unchristian and impious position, that it is lawful to murder or destroy any person or persons whatsoever, for or under pretence of their being heretics or infidels; and also

that unchristian and impious principle, that faith is not to be kept with heretics or infidels. And I do further declare that it is not an article of my faith, and that I do renounce, reject, and abjure the opinion, that princes excommunicated by the pope and council, or any authority of the see of Rome, or by any authority whatsoever, may be deposed or murdered by their subjects, or any person whatsoever. And I do promise that I will not hold, maintain, or abet any such opinion, or any other opinion contrary to what is expressed in this declaration. And I do declare, that I do not believe that the pope of Rome, or any other foreign prince, prelate, state, or potentate, hath or ought to have any temporal or civil jurisdiction, power, superiority, or pre-eminence, directly or indirectly, within this realm. And I do solemnly, in the presence of God, profess, testify, and declare, that I do make this declaration, and every part thereof, in the plain and ordinary sense of the words of this oath, without any evasion, equivocation, or mental reservation whatever; and without any dispensation already granted by the pope, or any authority of the see of Rome, or any person whatever; and without thinking that I am or can be acquitted before God or man, or absolved of this declaration, or any part thereof, although the pope or any other person or authority whatsoever shall dispense with or annul the same, or declare that it was null or void.”

Which said declaration and oath shall be subscribed by such person with his name at full length, if he can write, and if not, with his mark, and his name shall be written by the officer, adding his title, addition, and place of abode, which shall there remain of record: and such officer shall make, subscribe, and deliver a certificate of such declaration and oath having been duly made and taken, if demanded, for which he shall have 2*s.*; which certificate shall be competent evidence, unless falsified.

And such officer shall yearly, on or before the 25th of December, transmit to the privy council lists of the persons, with their titles, additions, and places of abode, who shall have made and subscribed such declaration and oath in the preceding year.

And no Roman Catholic, who shall have taken and subscribed the said oath as aforesaid, shall be convicted upon any of the acts following; *viz.* 1 Eliz. c. 2. 23 Eliz. c. 1. 29 Eliz. c. 6. 35 Eliz. c. 2. 1 Jac. I. c. 4. 3 Jac. I. c. 4. 3 Jac. I. c. 5. and 7 Jac. I. c. 6. or any other statute or law of this realm; or in any ecclesiastical court, for not resorting to church, or having servants who shall not resort to church, or other place of common prayer.

And by 43 Geo. III. c. 30. Roman Catholics taking and subscribing the declaration and oath contained in the 31 Geo. III. c. 32. shall be entitled to all the benefits of the 18 Geo. III. c. 60. to every purpose as if they had taken the oath thereby prescribed.

And whereas, by 23 Eliz. c. 2. 27 Eliz. c. 2. 35 Eliz. c. 2. 2 Jac. I. c. 4. 3 Jac. I. c. 5. 3 Car. I. c. 2. 25 Car. II. c. 2. Papists are made subject to several punishments, penalties, and disabilities, it is enacted that no person who shall take and subscribe the said oath in manner aforesaid shall be prosecuted or convicted for being a Papist, or reputed Papist, or for professing or being educated in the Popish religion, or for hearing or saying mass, or for being a priest or deacon, or entering or belonging to any ecclesiastical order or community of the church of Rome, or for being present at or performing or observing any rite, ceremony, practice, or observance of the popish religion, or maintaining or assisting others therein.

Provided always, that no place of congregation or assembly for religious worship shall be allowed, until the place

TOLERATION.

of such meeting shall be certified to the sessions of the county or place in which the same shall be held, and be there recorded; and the clerk of the peace shall give a certificate thereof, if demanded, for which he shall have *6d.* And no minister or other person shall officiate in any such place of meeting until his name and description as a priest or minister shall have been recorded at the sessions, for which shall be paid *6d.* and a certificate thereof shall be granted, if demanded, for which shall be paid *2s.* And no priest or minister who shall officiate in any such meeting not so recorded as aforesaid shall be deemed to be within the benefit of this act for any purpose whatsoever.

Provided, that if any such place of assembly shall have the doors locked, barred, or bolted, during the time of meeting, all persons who shall come to or be at such meeting shall receive no benefit from this act, notwithstanding his having taken such oath as aforesaid, but shall be liable to the same pains and penalties, as if this act had not been made.

If any Roman Catholic shall hereafter be appointed high or petty constable, churchwarden, overseer of the poor, or any other parochial or ward office, and shall scruple to take upon him any of the said offices, he may execute the same by a sufficient deputy, to be approved of in like manner as other persons.

Every minister of any Roman Catholic congregation who shall take and subscribe the said oath in manner aforesaid, shall be exempt from serving on juries, and from the office of church-warden, overseer, or other parochial or ward office, or other office in any hundred of any shire, city, town, parish, division, or wapentake.

But all laws made for frequenting divine service shall continue in force, unless where persons shall come to some religious worship permitted by this act, or an act of 1 W. & M. for exempting Dissenters.

And if any person shall wilfully and on purpose maliciously and contemptuously come into any congregation or assembly of religious worship permitted by this act, and disturb the same; or misuse any priest, minister, preacher, or teacher therein, he shall, on proof by two witnesses, before one justice, find two sureties of the peace to be bound by recognizance in *50l.* and in default thereof, shall be committed to prison till the next sessions, and on conviction of such offence at the sessions, shall forfeit *20l.* to the king.

Provided, that no benefit herein contained shall extend to any Roman Catholic ecclesiastic permitted by this act, who shall officiate in any congregation, or assembly hereby permitted, with a steeple and bell, or at any funeral in any church or church-yard; or who shall exercise any of the rites or ceremonies of his religion; or wear the habits of his order, save within some place of congregation, or assembly for religious worship permitted by this act; or in any private house where there shall not be more than five persons assembled besides those of the household; or who

shall not previously to his so exercising his function have taken the oath of allegiance, abjuration, and declaration hereby appointed, in manner aforesaid.

But nothing herein shall exempt any Roman Catholic from paying tithes or other parochial duties, or any other duties to the church or minister; or to repeal any part of 26 Geo. II. c. 33. "for preventing clandestine marriages," or any parts or any statutes concerning marriages; or to give any ease or benefit to any person who shall, by preaching, teaching, or writing, deny or gain say the oath and declaration aforesaid, or the doctrines therein contained, or any of them; or to repeal or affect any law concerning the right succession to or limitation of the crown.

And no Roman Catholic, who shall take and subscribe the said oath of allegiance, abjuration, and declaration, as aforesaid, shall be prosecuted for teaching youth as a tutor or school-master; but he shall not hold any mastership of any college, or school of royal foundation, or of any other endowed college or school for the education of youth; nor shall keep a school in either of the universities; nor shall receive into his school for education the children of any Protestant father; nor shall teach any school until his name shall be entered at the sessions in manner aforesaid, as a Roman Catholic schoolmaster: and no person offending in the premises shall receive any benefit from this act.

Provided also, that nothing herein shall make it lawful to found, endow, or establish any religious order or society of persons bound by monastic or religious vows; or any school, academy, or college by any Roman Catholic; and that all uses, trusts, and dispositions, whether of real or personal property, before deemed to be unlawful, shall continue to be so deemed.

No person shall be summoned to take the oath required by 1 W. & M. sess. 1. c. 8. or the declaration required by 25 Geo. II. c. 2. Nor shall the 1 W. & M. sess. 1. c. 9. for removing Papists from London and Westminster, extend to Roman Catholics who shall have taken and subscribed the oath, &c. herein appointed.

No peer who shall have taken and subscribed the said oath, &c. in manner aforesaid, shall be liable to be prosecuted under 30 Car. II. st. 2.

And the 1 Geo. I. sess. 2. c. 55. and 3 Geo. III. c. 18. requiring Papists to register their names and real estates are repealed; and all deeds and wills of Papists shall, after the 24th of June 1791, be good as if the said acts had never been made.

And whereas by 7 & 8 Will. c. 4. and 1 Geo. I. st. 2. c. 13. every person acting as a counsellor at law, barrister, attorney, solicitor, clerk, or notary, not having taken the oaths and declaration therein prescribed, should be liable to certain penalties, it is enacted that these oaths and declarations shall be no longer required; but the oath and declaration herein appointed shall be taken in lieu thereof, in manner aforesaid.
